PRESTON S. ARKWRIGHT

Preston S. Arkwright, forty-second president of the National Electric Light Association and president of the Georgia Power Company, is a native Georgian. He was born in Savannah, February 24, 1871. He prepared for college in the Savannah schools and was graduated from the University of Georgia in 1890 and from the law school of that University in 1891.

Soon after his graduation he began the practice of law in Atlanta. He entered public utility work in 1901, when he became vice-president of the Georgia Electric Light Company. In 1902, he was elected president of the Georgia Railway and Electric Company, and when the Georgia Railway and Power Company was formed in 1912, acquiring control of the Georgia Railway and Electric Company and other utility companies, Mr. Arkwright was elected president of the new company. This position he held until the Georgia Railway and Power Company consolidated with about twenty other public utility companies in Georgia to form the Georgia Power Company in 1927, Mr. Arkwright becoming president of the consolidated company. Formation of the new company followed the acquisition of control of the Georgia Railway and Power Company and a number of other Georgia utilities by the Southeastern Power and Light Company. These various Georgia companies were consolidated in the new company or are operated as subsidiaries, and together they supply electric service to approximately 235 cities and towns in Georgia. Street railway service is supplied to the larger cities.

Mr. Arkwright is chairman of the Public Policy Committee of the National Electric Light Association. He is also vice-president of the Association of Edison Illuminating Companies, and former president of the Southern Gas Association.

TABLE OF CONTENTS

GENERAL SESSIONS

First Session—Tuesday, June 4, 1929

Address of Welcome by Bertram E. Whitman 1

Address of President P. S. Arkwright 2

Report of Treasurer P. S. Young 7

Report of Managing Director Paul S. Clapp 7

"The Public Right as to Electric Rates," by William L. Ransom 10

Introduction of Foreign Speakers via "Talking Movies," by W. H. Onken, Jr. 16

"The Superiority of Private Enterprise," by Sir Ernest Benn 16

Report on Public Relations National Section, by J. F. Owens 17

"The Customer's Side of the Meter," by A. W. Robertson 23

Report of Constitution and By-Laws Committee, by R. F. Pack 25

Second Session—Wednesday, June 5, 1929

Report of Exhibition Committee, by E. W. Goldschmidt 27

Report on Engineering National Section, by E. C. Stone 28

"Electrification of Railroads," by Britton I. Budd 31

"Railway Electrification," by George Gibbs 34

"Electricity's Contribution to Commerce," by Dr. Alberto Pirelli 40

Report on Commercial National Section, by Marshall E. Sampsell . . . 41

"National Food Preservation Program," by P. B. Zimmerman 44

"Sales Increase or Rate Increase," by Matthew S. Sloan 45

"Science and Progress in the Industries," by John J. Carty 48

"Introduction of Foreign Visitors," by Sidney Z. Mitchell 52

Third Session—Thursday, June 6, 1929

Report of Prize Awards Committee, by W. H. Onken, Jr. 54

"Plans for Light's Golden Jubilee," by N. H. Boynton 54

"The Inspiration of a Name," by Charles L. Edgar 58

"The Birth of the Industry," by Elmer A. Sperry 60

"From the Lamp—The Electrical Industry," by Thomas N. McCarter . . 63

Introduction of Henry Ford, by E. Wilbur Rice 66

"Greetings to the Convention," by Thomas A. Edison 69

"The Lamp of Aladdin," by Berton Braley 69

GENERAL SESSIONS—(*Continued*)

Fourth Session—Friday, June 7, 1929

Report of Memorials Committee, by W. H. Onken, Jr. 73
Report on Accounting National Section, by J. F. Ford 75
Constitutional Revision Committee 76
"Rural Electrification," by J. R. Howard 77
"Industrial Development in the United States and Canada," by James L. Madden 80
"Public Utility Regulation and Its Accomplishments," by William J. Hagenah 85
"Federal Trade Commission's Investigation," by Bernard F. Weadock . . 90
Report of Nominating Committee 91
"Japan's Tribute to Light," by Sir Kengo Mori 93

ACCOUNTING NATIONAL SECTION SESSION

Tuesday, June 4, 1929

"The Professional Motive in Public Utility Management," by Deane W. Malott 99
"The Account and Modern Business," by W. Alton Jones 104
"The Trend of the Times," by David Lawrence 108

COMMERCIAL NATIONAL SECTION SESSION

Wednesday, June 5, 1929

Report of Lighting Bureau, by T. O. Kennedy 115
Report of Power Bureau, by V. M. F. Tallman 117
Report of Merchandising Bureau, by F. D. Pembleton 120
Report of Refrigeration Committee, by C. L. Dunn 122
Report of Electric Heating Committee, by Norman T. Wilcox 123
Report of Domestic Electric Range Committee, by F. A. Coupal 123
Report of Merchandise Sales Committee, by C. L. Harold 124
"National Food Preservation Program," by P. B. Zimmerman 126
"From Theory to Action," by Gerard Swope 127
"Selling Diversified Kilowatts," by Martin J. Insull 128
"Commercial Development," by C. E. Groesbeck 129
"The Electrical Industry Sales Conference," by W. W. Freeman 131
Award of Prizes of Kilowatt-Hour Contest, by Earl E. Whitehorne . . . 133
Award of Federal Electric Company Prize, by J. E. Davidson 134

ENGINEERING NATIONAL SECTION SESSION

Tuesday, June 4, 1929

"Practical and Economic Aspects of Standardization," by L. L. Elden . . 140
"Shall We Grow Like Topsy or According to Plan?" by A. C. Marshall . 144
"Engineers and Engineers," by Frank Phillips 147
Report on Engineering National Section, by E. C. Stone 148

PUBLIC RELATIONS NATIONAL SECTION SESSION

Thursday, June 6, 1929

"What Is Your Women's Committee Doing?" by Sophia Malicki 162
Award of Forbes Public Relations Cup, by B. C. Forbes 163
"Super Humans for Super Institutions," by John F. Gilchrist 164
"The Part Electricity Can Play in Better Home Management," by Lita Bane 170

PUBLIC POLICY COMMITTEE SESSION

Thursday, June 6, 1929

Report of Charles A. Coffin Prize Committee, by P. S. Arkwright . . . 177
Report of the Public Policy Committee, by W. W. Freeman 178
"America's Fifty Years of Aladdin," by Julius H. Barnes 181

GENERAL SESSIONS

PROCEEDINGS

of the

Fifty-second Convention

NATIONAL ELECTRIC LIGHT ASSOCIATION

FIRST GENERAL SESSION

TUESDAY, JUNE 4, 1929

[The fifty-second Convention of the National Electric Light Association convened in the ballroom of the Atlantic City Auditorium and Convention Hall, Atlantic City, N. J., at 10.10 a.m., President P. S. Arkwright presiding.]

PRESIDENT ARKWRIGHT: The Convention will please come to order. The time of the meeting is limited. It begins later than usual, and I am anxious that it should start on time hereafter.

The representative of the Mayor is here. We have been to Atlantic City often and enjoyed the hospitality of the city, but we have never been welcomed into the city's own home before, as well as the city itself. We have the distinction of being the first guest in the city's house and home.

I present to you Bertram E. Whitman, the representative of the Mayor of Atlantic City, who will tell us how very welcome we are. Mr. Whitman! (Applause).

ADDRESS OF WELCOME

BY BERTRAM E. WHITMAN, *City Clerk*

His Honor, the Mayor of Atlantic City, because of another business engagement which took him from the city, found it impossible to be with you on this occasion, and he has requested me to come in his stead and to express his regrets.

As his representative I assure you that it is with no small amount of mingled pride and pleasure that I appear before you at this time in order to extend to you a sincere welcome to our city. I feel, however, that this is not at all necessary, due to the fact that on so many previous occasions you have been holding your annual gatherings in this city. And you know, without any words from me, that you are sincerely welcome, and how glad we are to have you in our midst.

However, it does seem a very pleasing coincidence that for the first time this great auditorium has been used for a purpose such as you are now using it that that distinction has fallen to your body. Just at this time, as you well know, we have completed the dedication of this wonderful auditorium. We are at the present time celebrating the seventy-fifth anniversary of the incorporation of our city, and at the same time there is being celebrated the fiftieth anniversary of the perfection of the incandescent light.

And so I say to you that it is a very happy situation to have you assembled in this great building and at this particular time, because it is to you men that the world owes the great advancement in the matter of the perfection of the electric light that we are now enjoying throughout the land.

I am reminded of a couple who came into our city not long ago to spend their honeymoon. They went to one of our large hotels, and the waiter seemed to be over-zealous in looking after their needs. Every once in a while he would go up to them and ask them if there was anything further he could do for them. The young man said, "No" repeatedly, and after a while he became a little annoyed at the waiter's persistence, and he said, "Yes, bring us an order of honeymoon salad."

The waiter goes back to the kitchen and gives the order. The chef is somewhat perplexed. Finally he calls the waiter and says, "Do you mind finding out what that honeymoon salad is?"

The waiter goes back to the young man, and he says, "Boss, pardon me, but will you kindly tell me what that honeymoon salad is?"

The young man said, "Yes, just let us alone." (Laughter).

And so, my friends, having performed the very pleasant duty for which I have come here this morning, it gives me great pleasure at this time to turn over to your President the key to our city, the queen of seashore resorts, the world's playground, and to assure you that it is our desire that your stay among us may be a most pleasant one, and that we will have the opportunity of welcoming you here to our city many, many more times.

And having concluded the duties for which I have come before you this morning, it gives me pleasure to turn over this key to the President of your organization, with the hope that you will make use of it. And if there is anything that the Mayor of the city or the officials can do to make your stay more pleasant, we sincerely hope that you will call upon us. And now I will let you alone in order that you may conduct the business for which you have assembled. I thank you.

[Tenders key of the city to President P. S. Arkwright (Applause).]

PRESIDENT ARKWRIGHT: I know we appreciate the very gracious words of welcome from Mr. Whitman. We are inclined to feel at home here; he has made us feel completely so. We will not abuse his hospitality, and we are very, very thankful to him for his kind words.

[Vice-Chairman J. F. Owens assumed the chair.]

ADDRESS OF PRESIDENT P. S. ARKWRIGHT

This convention can't help being good. It has the distinction of being the first convention of any kind to meet in the largest and best equipped auditorium in the world, just completed by the municipality of Atlantic City. This not only adds interest but provides conveniences, facilities and comforts never possessed before.

The exhibition hall, in commodiousness, arrangement, protection, accessibility, lighting, ventilation facilities and appointments, approaches perfection. The auditorium, while a credit to Atlantic City, will prove a joy to us.

The exhibition is in keeping with the electrical industry and the auditorium. The manufacturers and the Exhibition Committee have excelled themselves. It is the largest, most complete and most attractively displayed exhibition we have ever enjoyed. It excels any previous exhibition of any industry. Its value in education and interest to our membership is more than sufficient recompense for the entire cost in time and money devoted to holding and attending the convention.

The program has been arranged so as to provide adequate time for a close inspection and study of the exhibits. If, however, any of you should find that you cannot inspect the exhibits and attend the General Business Sessions, too, I recommend, nevertheless, that you do not fail to see the exhibits.

A Nation-Wide Tribute

This convention occurs in the year of the fiftieth anniversary of the electric incandescent lamp, and marks the beginning of the great nation-wide tribute to Thomas A. Edison and the observance of Light's Golden Jubilee. So useful a need did the electric incandescent lamp fill, that two and one-half billion of its fellows are in use today. But vastly improved are they—in appearance, in ruggedness, in longevity, in economy, in efficiency, in quality of light, and in adaptability for varied uses.

The improvements in the lamp, combined with the wonderful development of the electric industry following in its wake, have brought such great reduction in its price that its enjoyment is now within the reach of any pocket book. It is the cheapest light the world has ever had. Wherever available—and that means almost everywhere—electric light is now the universal artificial illuminant. If the only accomplishment of the electrical industry were the electric light alone, it would have more than justified itself. The value to the world and the customers of the industry of the lighting service by itself exceeds the total cost of all the electric service of all kinds and for all purposes.

But out of the lamp came the electrical industry, serving at first a limited area in the most congested section of our largest city, and through the ingenuity, initiative, courage and effort of men, growing by leaps and bounds through the short years, until we now have electric central stations with long distance transmission and interconnected systems and their distribution networks, supplying house-to-house electric service for lighting, heating and power purposes to over 23 million customers in the United States, in practically every city, town and hamlet. Within a few years of the very recent past electric service has been made available to approximately 500,000 farms and is now spreading to the others at an accelerating pace.

Almost every day brings new applications of the service, new devices to take the place of human drudgery, to lighten and brighten the work of living, to multiply the output of the factory and the earnings of the workman, and to take away the tasks of the home.

No wonder that all over the world the fiftieth anniversary of the birth of the electric incandescent lamp is celebrated!

To this association at this convention has come the privilege of inaugurating Light's Golden Jubilee. A day of the sessions has been set aside especially for appropriate recognition of the event. But the spirit of the occasion will be over all the sessions, stimulating and inspiring us to continued and greater effort to carry electric service over expanding areas to more and more people and to their even greater advantage, and to accept Mr. Edison's example of patience, persistence and whole-hearted devotion to an idea as the ideal of what the industry should strive for in its dealings with the public.

An Association of Independent Units

You have honored me to serve you during the year as President of the National Electric Light Association. I have had opportunity to more fully evaluate the work of the Association and to measure the contributions it makes to advancement in electrical progress. In spite of the apparent needlessness of saying it, I would like to emphasize that the National Electric Light Association is a voluntary association of separate, independent units. It does not operate, control, manage, construct, finance or share in the ownership of any electric light or power company. Nor has it any power or authority of direction, control, censorship or veto over the acts, conduct or utterances of any member of the Association. Its function is to accelerate, stimulate and coordinate effort in electrical progress. The objective of the Association is "to advance the art and science of the production, distribution and use of electrical energy for public service." This objective is followed with vigor and certainty of purpose. Through the Association the most advanced ideas, drawn from the practical field of experience of member companies in engineering, accounting, business methods and all the various aspects making up the business, are discovered and diffused.

The company members are not in direct competition with each other in the same field. Therefore, there cannot be and there is not any effort to fix prices of the product or to curtail production. There are no trade secrets between the utilities. On the contrary, the originator of a new idea or improvement finds recognition for his contribution by making it known to his co-workers through the Association.

The Result of Cooperation

The sum total of best abilities and best minds within the utilities is made available to member companies, large and small, in all sections of the country. Without the Association improvements found by one company would be isolated there; through the Association they find acceptance and prompt application throughout the entire country. Each company thus benefits from the progress of the others, and the public generally obtains the benefits of a progressive, improved electric service.

Of the recent forces in the economic structure of the nation, none has been more fundamental in advancing the living standards than mass production. Mass production of electric power is outstanding among these. We call it interconnection. I refer to the creation of the great interconnected electrical systems concentrating major power production in large, efficient power houses, then diffusing and subdividing this power as required for smallest or largest user, in city or hamlet, in the home, the factory, or on the farm. Our engineers, through the medium of the Association, years ago formulated and secured wide acceptance of standard voltages, frequencies and operating practices, thereby laying the essential background which made possible the interconnection of adjacent power systems. The Association rightfully deserves much credit for the rapidity and soundness with which the benefits of this far-reaching advance in power development have been brought to the American people.

Service Everywhere

There is today available in practically every quarter of the United States abundant and reliable supply of central station electric power at prices competing so successfully with the cost of power from other sources that the public often assumes that the utility companies have a complete monopoly of power supply. The total increase in power capacity in the nation's factories, mines and quarries since 1919, amounting to 9½ million horsepower, has been in electric motors. These industries had available to them alternative power sources, which they could themselves locally install. This growing reliance of the country's manufacture and mining upon electric utilities for their added power supplies is convincing evidence of the remarkable performance of these companies in provision of low cost, reliable power deliverable at almost any point in any quantity desired.

Advances in Power Production

The accomplishment of the almost revolutionary changes in the engineering, operating and economic characteristics of electric power supply, concurrently with need for large expansion in facilities, has thrown an enormous burden of work on our engineers. The best engineering policy and experience within the industry is engaged in interchanging ideas, compiling authoritative information and making this available to every company. Each company benefits from the judgment and experience of engineering talent which in the aggregate but few, singly, could afford to engage.

The major advances in the art of power production from the beginning of the electrical industry have come through that industry. Without these inventions and improvements, there could have been no large scale substitution of mechanical for hand labor. Let me briefly summarize these advances: The reciprocating engine was developed to its maximum size and efficiency; the steam turbine, known to Nero in 100 B.C., remained impractical until its combination with the high-speed electric generator, and is the major development in steam utilization in the last half century and now the world's principal prime-mover; hydro turbines and the whole conception of hydroelectric development have reached their furthest advance in the utilities. Running through all this path of progress may be found the work of the National Electric Light Association and its members in constant stimulation and diffusion of information on best practice.

Economical Generation and Transmission

The trend is toward larger and more efficient units for power production. Size of turbine and generating units has increased in ten years from 40,000 kw. to 208,000 kw. Single power houses are under construction to house 1,000,000 h.p. These huge power stations—the hearts of the electrical systems—are outstanding marvels of engineering accomplishment. Average quantity of fuel burned per kilowatt-hour in 1919 was 3.2 lb. Continued improvement in power house design and operation pushed this average consumption per kilowatt-hour to 1.76 lb. in 1928. The aggregate saving due to gains in efficiencies since 1919 amounts to 180 million tons.

The Association is directing aggressive attention to transmission and distribution, design, construction methods, operating and maintenance practice and safety rules, in both overhead and underground systems. High-voltage cables are under experimental research. Ways are being sought to more economically transmit the increased quantities of power in both overhead wires and underground cables, in spite of conditions increasingly difficult due to congestion. Marking and lighting of power structures within airways, power line crossings over railroads, coordination of the operation of our service with telephone, telegraph, train control and radio—all involving important relations with other public service—are enlisting your Association's consideration.

Our engineers have focused particular attention toward sound, advance planning of whole electrical systems, anticipating future requirements of the communities served and visualizing the step-by-step placement of power houses and transmission structures to adequately meet the power requirements of each locality at minimum cost. Because of this system planning, electric power facilities, taking the country as a whole, are located and constructed for maximum utilization, most economic operation and without wasteful duplication.

Research

Your Association, in behalf of its members, at the convention last year announced its participation along with other industries in the plans of the Pure Science Research Fund for a program in pure science research in the colleges and universities during the next ten years. Provision for our participation was made through increased dues, and the Association is now prepared to take its part in this movement as soon as plans are finally formulated by the National Research Council and the National Academy of Sciences.

Cooperation

There has been fuller cooperation between the various branches of the electrical industry in meeting common problems of electrical development. There has been decided progress in better understanding between the manufacturer, the contractor-dealer and all merchandisers of electrical equipment. Our visualization of the contributing factors in electrical development is expanding to properly embrace the whole group of some 700,000 men and women engaged in research, design, manufacture, construction, installation, management, operation and financing of this great development. The fine work of the National Electrical Manufacturers Association, the Association of Electragists, International, and the Society for Electrical Development, and their cooperation with the National Electric Light Association, have been contributing factors to this enlarged mutual understanding and direction of common effort toward fuller electrical development.

Accident Prevention

The association from its beginnings has continuously prepared and diffused information on safe methods of operation, improvements in design for safety, instruction in methods of resuscitation from shock—all designed to safeguard both life and property. As a result of the association's stimulus, thousands of executives and employees of the companies each year receive instruction. Savings in property loss and from reduction of time loss resulting from accidents are extremely large. A direct measure of the great human value of this useful endeavor is the award in seven years of Insull Medals to 264 persons for saving life.

Standardization

Most of us do not realize the enormous volume of work carried on by the association in connection with standardization, simplification, and codification. It is a decided factor in lowering cost and increasing facility in use of electric service. There is scarcely a piece of equipment apparatus or material used in rendering the service which is not involved; it likewise relates directly to our customers. This work could not be accomplished by any company acting individually; it requires expression of industry viewpoint at over 200 points of contact with national and international standardizing groups. The savings attained to the companies in reduced costs of equipment, reduction of inventories and facility in repairs amounts to millions of dollars annually. Practical uniformity in character of electric supply for voltage and frequency has been attained; attachments for lamps and appliances are the same throughout the nation effecting large reductions in cost of electrical equipment purchased by the consumer, and adding enormously to convenience. Particular attention has been given this year to increased participation in this work and to strengthening industry representation.

Community Development

The electric utility company prospers only as the individual community prospers. Our investments in facilities are an integral part of the thousands of communities we serve. If business is better elsewhere, we cannot pick up and move. Recognizing this, the association is assisting and urging its member companies to more actively participate in local community and State development. It develops information of value particularly to the small town in furthering industrial development.

Rural Service

Decided progress has been made in extension of electric service to farms, an increase of 30 per cent being credited to this year, which brings the total served to 500,000. It is perhaps the most significant accomplishment of the year. It is only well started. The National Electric Light Association has sponsored and stimulated this endeavor. In 1923 it initiated through the Committee on Relation of Electricity to Agriculture a nation-wide research program participated in by the farmers, agricultural engineers, agricultural colleges, electrical manufacturers, and utility companies, along with other agencies. Research in rural electrification continues in a number of State experimental projects, and a National Rural Research project is being established in Maryland. A vast body of practical information on adaptations of electricity to farm work has been developed and diffused. It aids the farmer in visualization of benefits of electric service to him; it stimulates us to greater effort in overcoming problems of extension of our service to him. The same intensive effort which successfully accomplished electrification of manufacturing industries is now being turned to the most important of all our industries—agriculture. The association has this year sponsored important regional conferences on rural electrification, and has provided information of assistance to companies in establishing rural service departments.

Railroad Electrification

Increased volume of freight and passenger traffic, arising from growing population and advancing prosperity, has stimulated further attention by railroads to main line and terminal electrification. Electrification programs have been announced this year by the Pennsylvania, the Philadelphia and Reading, and the Lackawanna railroads. Other railroads have electrification plans under study. It is certain that our railroads will make that use of electricity consonant with sound transportation development. We wish to assist them.

Accounting

The accountants of the industry have a great responsibility. The volume and complexity of accounts have grown to enormous proportions. They have been confronted with the task of handling current accounts, as represented by gross earnings, which increased from 281.9 million dollars in 1912 to 1,900 million dollars in 1928. The number of customer records involving monthly billings has grown from 4 million to 23 million. The investment in facilities to be accounted for has grown from 2.1 to 10 billion dollars.

In this field of accounting, the association has been constantly on the alert, keeping pace with ever-changing conditions and problems and in step with industry progress. Every phase of accounting principles and interpretation has been made the subject of thorough research.

The Accounting Section is giving special attention to accounting for interconnection, merchandise accounting, budgeting, and the latest questions in the field of investment trusts.

Continued study has been applied to simplification of procedure in forms and records, particularly in simplification of customer records and bills. Savings attained in reducing cost of handling these accounts represent thousands of dollars. The care and attention given by our accountants to methods of maintaining customers' accounts and billings have been a most important factor in improved customer relations for the only point of contact with many of our customers is through the monthly bill. The Accounting Section of the association is to be particularly commended for the excellent results attained in this direction and for their fine concept of the customer viewpoint in handling accounts.

With the growing proportions and complexity of the business the accountant will increasingly be called upon to furnish the records of the past and to visualize problems of the future as a base upon which our executives may make forward plans.

Public Relations

From the standpoint of morale, as well as of material things, I believe no twelve-month period ever has been better for the electrical industry than the one just passed. This is equally true of your association.

During the year the industry, largely through the association, has borne the brunt of the assault of those who would nationalize the country's industries, businesses and professions. Much of this attack has been directed toward the so-called public relations work of the association—a work miscalled "propaganda." Despite this, the Public Relations National Section has carried on its constructive work of aiding and directing the industry in its duty of fully informing the public regarding past and present performance and future possibilities and obligations.

Among the many committee activities, all of which have consistently and persistently moved ahead under the able leadership of Vice-president J. F. Owens, chairman of the Public Relations National Section, are two outstanding developments. One is the study made of industrial relations, by a committee of that name, which includes Health and Medical and Employee Contact practices and instruction, serial reports having been issued and others being in preparation. The other is a study of the Migration of Industry, made by the Metropolitan Life Insurance Company at the request of the Association and in cooperation with the Civic Development Committee.

Widespread as are the activities of this Section, they constitute but a minor part of the overall activities of the Association although a most important part, since future progress of the industry depends in no small degree upon the confidence the public has in the industry and its integrity and honesty of purpose. We feel that we are successfully doing our job—furnishing the best electric service in the world to our customers at fair rates, safeguarding the interests of our investors in our securities, and doing our part in helping to make this the happiest and most prosperous country in the world, and it is a part of that job to keep the public informed.

Commercial

Problems of marketing are confronting our industry no less than other industries producing products for distribution. We recognize an immediate need for concentration on our commercial possibilities. Potentially they are amazing, and the selling departments of our power companies are meeting the challenge with vigorous effort.

Surveys reveal our accomplishments of the past and unfold almost limitless opportunity for commercial expansion. Whether we vision the future all-electric home or the vast sales possibilities in the application of electricity in commerce and industry and in the industrializing of the farm, our conclusion is the same. "Serving the public" unfolds unlimited opportunity for business development.

Our commercial progress, of course, is affected by numerous agencies making the marketing of our service unlike that of other commodities. We cannot store our product; we cannot change our prices at will; we cannot transport and deliver always in the most economic methods; we have a limitation of territory in which we can market. In fact, we must build a market by building the community. And yet, we realize as never before how keen our competition is in the selling field.

Important problems of market analysis, the construction of industry-selling programs, the development of salesmen and methods to cope with modern requirements of highly specialized selling, are all being examined and promoted by our National Commercial Section. It is organized to meet the demand upon it for intensified activity and is rendering a highly valued service to the industry.

Geographic Divisions

The Geographic Divisions are recognized as the basis backbone of the whole Association. I have been enormously impressed as I have gone from one Geographic Division to another with the intensiveness, practicalness and thoroughness with which the respective Geographic Divisions and their committees are dealing with and mastering the problems relating to their respective areas, this not only through the Geographic Convention, but in the conferences and committee meetings taking place during the year. Also, I have been impressed by the contributions coming from the several Geographic Divisions which, through the agencies of the National organization, are diffused throughout the entire country, to the benefit of the entire industry.

An electric light and power company, in itself, can make no enemies, can gain no friends, can do no wrong. Such friends as it has, those engaged in the industry must gain for it. Such enemies as it gets, those in the industry make for it. It has only such character as the men and women who are operating and managing these companies give to it.

So in going around the country and meeting the men and women from all sections, above all, I have been impressed with the outstanding character, the exceptionally high ideals of business conduct and integrity possessed by the men and women engaged in the electric light and power industry. They are seeking to operate the properties at a profit, of course, because a business service must earn its way if the business service is to continue, but there is a striking absence of greed among them. They are endeavoring to furnish a useful service at a reasonable rate of pay, and if you will notice the rates charged by this industry for its service, you will see that they almost stand alone as a record of constantly descending prices year by year from its beginning to the present day. And I believe it is true that almost every company in the entire United States during the last 18 to 24 months has revised some of its rates downward so that average rates are each year less than they were the year before.

But everywhere, in addition to rendering useful service at a fair rate, these companies and the men and women engaged in them are taking a leading part in the development of their communities and their companies are generally regarded in their localities as the most constructive force in the upbuilding and progress of the territories they serve. Locally they deserve and enjoy almost universal respect and esteem.

The story of the industry, its accomplishments, opportunities, purposes and policies will unfold as the program of the convention proceeds. It is an inspiring story with new things happening year by year which give zest to the telling.

Another matter I have been particularly impressed with in your association is the type of the headquarters organization. I found it completely organized, well equipped, a selected personnel, well trained and experienced, and in my judgment there is no better business organization or headquarters organization of any industrial association in the whole country.

Anybody can be president of the National Electric Light Association, if you show him sufficient partiality. He can't go far wrong with such an organization behind him to do the work for him and give to him the credit.

I extend to you my very great thanks and appreciation for your partiality and kindness in conferring upon me the distinction of being president of the National Electric Light Association for this year. I shall cherish the memory of it always. (Applause).

CHAIRMAN OWENS: President Arkwright, with his characteristic modesty, has requested that no Committees on the President's Address be named. We who have followed him during the year will, of course, accede to that request, but I am sure you would not like to have this moment pass without having some of us who have followed under his leadership during the past year give an expression of what I am certain is in your mind, of the marvelous contribution that this great man, with his great mind, has made to the industry during the past year. (Applause).

These have been trying times, but it seems as though Providence itself had looked down and had picked the very man who could lead the industry, with credit to the industry and with glory to himself, during this period of trial. And I assure you, and I believe you will agree, that leadership just such as that, perhaps not so outstanding, but certainly leadership, is to be found in every branch of this industry, in every section of the country. And Mr. Arkwright in his great contribution, not only to the industry but to the nation during the past year, is typical of the contributions that men and women in this industry are making every hour and every day to the advancement of social order and to the benefit of society.

And I congratulate you on having had the privilege of having, as the leader of this great industry during the past year, such an outstanding man as our President, Mr. Arkwright. (Applause).

[President Arkwright resumed the Chair.]

President Arkwright: I am overwhelmed, but I nevertheless find it very pleasing to have people say nice things, even if I do feel that I have put something over on them.

The next item of business is the report of the Treasurer, Mr. P. S. Young.

REPORT OF TREASURER P. S. YOUNG

I might summarize this report by saying that the finances of the Association are in excellent condition. As you know the operations of the Association are conducted under a budget system, thus all the expenditures come under complete control of the officers of the Association. The fiscal year of the Association ends on June 30, and therefore it is only possible to give you at this time the income and expenditures for ten months of this fiscal year.

A very considerable part of the Association's funds are now set aside for the purpose of a contribution to the Pure Science Research Fund. The Committee in charge so far has not called for any contributions from us. We have set aside, however, the funds which we have contracted to contribute.

Perhaps a few salient figures which will tell you of the financial occurrences for the past ten months may be interesting to you. There will be incorporated in the proceedings the report for the full fiscal year. That report will include a balance sheet as of June 30, 1929, a statement of income and expenditures for the fiscal year, and a summary of the surplus account.

At the beginning of the fiscal year, July 1, 1928, there was $407,172.08 cash on hand. Receipts for the first ten months of the year included $1,472,577.68 from dues; $66,225.73 from publications; $32,953.29 interest on deposits and income from securities; $400,000 redemption of Third Liberty Loan Bonds, those bonds having been purchased in order that we might get a larger rate of interest temporarily; $58,800 from contributions of subscribers to the Pure Science Research Fund—those were advance contributions; $50,505 from contributions to the 1929 Joint Research Fund; and $81,537.22, miscellaneous income and other credits; making the total receipts for the ten-month period $2,162,598.92. Adding the cash on hand previously mentioned, makes the total cash to be accounted for $2,569,771.

The expenditures during the same period have been as follows: Those applicable to preceding administrative year, $81,448.34; those applicable to budget appropriations of present administrative year, $1,000,903.15; cost of securities purchased, $202,425; for the 1929 Joint Research Fund, $25,443.41; and miscellaneous expenditures of $66,538.92; making total disbursements of $1,376,758.82, and leaving a cash balance as of April 30 of $1,193,012.18. I want to remind you, however, that this balance is subject to be drawn against for the remainder of the calendar year, as the 1930 dues are not collectible until Jan. 1, 1930.

The market value of the stocks and bonds owned by the Association as of May 31 was $487,839, as against a book value of $456,474 on that date. The market value of the securities owned on the same date a year ago was $232,000. A list of the securities owned will be published in the 1929 Proceedings.

The Association has had periodical audits of the accounts made by certified public accountants, and the accounts have been audited to April 30, 1929.

In closing, I again wish to express my appreciation of the highly satisfactory, faithful and efficient work of the members of the Headquarters Staff, whose duties have come under my observation. (Applause).

President Arkwright: The finances are in good condition and in good hands. The direction of the business and affairs of the Association is in the hands of the Managing Director, the leader of the Headquarters Staff, the real director not only of the Association's activities, but a director who sees to it that the volunteers do some work also themselves.

I take pleasure in presenting to you Mr. Paul S. Clapp, Managing Director. (Applause).

REPORT OF MANAGING DIRECTOR PAUL S. CLAPP

It is fitting at the outset of this convention that we briefly take note of certain outstanding marks of progress made during the year in electrical development.

Increased Use of Electricity in the Home

The increase of 1.1 billion kw-hr., or 15 per cent, of electricity used in homes during the year portrays accurately and vividly an unparalleled advance in American living standards. Again this year, over one million homes commenced to use electricity. They are in largest city, in smallest village and on the farms. This rate of growth has been maintained for the past seven years, and in this short span the benefits from utilization of electricity have been opened to nine million homes—the hearthstones of well over one-quarter of the nation's people. No more positive measure can be found of the part this industry has in furthering national well-being.

Homes are using more and more power. The average family used 459 kw-hr. during 1928, an increase of 7 per cent over the preceding year. The average paid by these families for their year's electricity was $30.10, an increase of only 3 per cent, clearly reflecting the lowering price and expanding use of electric service in homes. The average cost this year reached a level 25 per cent under pre-war, while costs of living generally persist at levels 70 per cent above pre-war.

Electricity and Industry

Again during this year electricity continued to assert itself as the essential source of power for industries. The year 1919 marked the beginning of a new industrial era—the era of electrification. It is as profound as the great economic transformation ushered in by England, which marked the shift from hand labor to machines. Government reports show that the tremendous increase of 9,800,000 h.p. put behind factory workers since 1919 has all been in electric motors. Beyond its use for prime-movers, electricity is finding added applications for heating, welding and processing. The widespread interconnected electric systems operated by the electric utility companies have become the source of reliable, adequate and low-cost power upon which this country's marvelous industrial performance depends.

Results of Factory Electrification

Electrification of factories is exerting vital and fundamental economic forces. This electrification of factories has released manufacturers from investments in boilers and engines amounting to nearly one billion dollars in the last ten years, thereby greatly facilitating industrial expansion. It has decreased coal required for factory production. Widespread availability of electric power is an important factor in the new industrial development which in increasing degree is taking place in small towns.

Increase in Power Capacity

During the year the public utilities increased the power capacity dedicated to public service by 1,890,000 kw. The capacity of the Pearl Street plant built by Mr. Edison, although its ratings were in number of lamps that could be lighted, was not over 559 kw. It represented virtually the whole electric power capacity of the nation. The grand total of the electric power generating capacity operated by the electrical industry has now reached 27 million kw., an amount four and a half times greater than that of any other nation.

Construction of added facilities last year required the expenditure of 753 million dollars, 60 per cent of which was spent for transmission and distribution facilities.

Over 14,000 additional miles of transmission lines above 11,000 volts were put into service, completing a network of 150,000 miles engaged in diffusion of power over the areas served. The investment in physical property of the utilities passed 10 billion dollars. Lowering charges for service have slowed down the rate of capital turnover from once in four and three-quarter years for 1922 to once in five and a half years for 1928.

The urgent need is for more aggressive business development. In the electric utilities, as in business generally throughout the country, the major advance since the war has been in the field of production. A remarkable job has been done in the provision of facilities for service, and enormous investments have been made in them. We now need larger utilization of electricity. The National Electric Light Association is strengthening its facilities to aid in commercial expansion. Intensive studies are being made of restrictions to enlarged electrical use, and plans are being evolved to overcome them. Intensive training courses have been held this year in electrical advertising, industrial heat applications, commercial cooking and rural electrification. General informational material of benefit to electrical salesmen has been and is being prepared. A national food preservation activity, to enlist further attention to food preservation in homes and to public health, has been sponsored, bringing together in coordinated effort all those interested in preservation of foods. I bespeak your local cooperation for its success.

The use which is made of electricity does not depend alone upon the cost of the kilowatt-hour. It depends upon the cost of wiring and installation, and it depends upon the cost of the current-consuming equipment. All these factors are interrelated. But of far greater importance, increased utilization of electric service depends upon enlarged public understanding and public acceptance of the electrical idea. We have a vast territory opened to us in more thoroughly informing our customers and prospective customers of the electrical equipment and appliances now available, and what they can do in the way of saving in time, effort and money. This larger field is a common responsibility of all those in any way connected with the electrical business.

Directing Common Effort

Accomplishment of full opportunity does not rest alone with the utility company. There are many groups concerned. Analysis discloses over 700,000 men and women directly engaged in electrical development—in research, design, manufacture, merchandising, wiring, construction, jobbing, financing and operation. Comprehension of possibilities, better mutual understanding and direction of common effort on the part of this great body will make it an enormous unconquerable driving force in electrical development. To this end your Association is bending every effort.

I can confidently say that this year will be characterized by increased understanding and common appreciation of possibilities between manufacturer, contractor-dealer, wholesaler, merchandiser, electric utilities and all those responsible for electrical progress.

The electrical industry involves every conceivable element growing out of the development and maintenance of an enormous public service. The National Electric Light Association not only must keep apace with this development; it must be a dynamic force projecting it forward.

You may be assured that every phase of the business is under constant study by the Association and its Committees. The budgets are carefully considered and supervised. There is ceaseless search for advanced ideas and improvements. These are promptly diffused to all member companies, and each participates in the general forward march. Without the Association, an idea originating within a particular company would largely be isolated there. With the Association, there is a constant interfusion and interchange of ideas between the thousands of men and women engaged in the industry.

Railroad Electrification

Under the auspices of its Committee on Railroad Electrification, the Association this year sent a special commission of experts to Europe to study railroad electrification practices of these countries. There has been developed information which, it is expected, will be helpful both to the utilities and railroads of this country. The findings will be reported to the convention tomorrow morning by Mr. Britton I. Budd.

Industrial Development Studied

Another fundamental research participated in by the Association this year deserves your particular attention. Our Civic Development Committee, in cooperation with the Metropolitan Life Insurance Company, has made a broad study of industrial development in the United States for the last two-year period. Over 14,000 factory owners were canvassed to determine where new factories are locating, and the factors affecting location. Mr. Madden, Vice-president of the Metropolitan company, will tell you of this on Friday morning.

Decentralization of Association's Work

With the growing complexity and magnitude of electrical development, it is clearly evident that decentralization of our work insofar as practicable is desirable. The work of the Geographic Divisions of the Association is increasingly important. To this end every positive assistance is being given to them from Headquarters.

Convention Uses New Instrument

The introduction of the talking-moving picture has provided us with a new instrument rich in possibilities. We are undertaking something this year which has never been tried by any national convention. We are making a talking-movie film of the whole convention and exhibit. A staff of expert talking-moving picture operators is here under the direction of a leading moving picture director. This film will be finished next week. Within ten days after the close of the convention it will be shown at Breezy Point, Minn. (North Central Division Convention), then in succession at Del Monte, Cal. (Pacific Coast Division Convention) and Seattle, Wash. (Northwest Division Convention). Thus we hope to translate to the thousands back home something of the inspiration and benefits of this great convention which you are privileged personally to enjoy.

Federal Investigation

During the year the National Electric Light Association has been under intensive Federal investigation. In accordance with the policy indicated by the officers of the Association, our attitude has been one of complete cooperation with the Government. Various representatives of the Federal Trade Commission have made repeated visits of varying lengths to our Headquarters offices. All accounts reaching back ten years have been scrutinized in detail several times; each voucher has been critically reviewed. Indexes of the complete files were furnished, and investigators were given prompt and complete access to every file requested. Requests for specific information and voluminous copies of material were complied with. Members of the staff, including myself, have testified in Washington frankly, completely and often. There has not been an expenditure, an action, a single phase of activity of the Association which has not been exposed to the searchlight of closest analysis. The investigation has been thoroughly, painstakingly and carefully done.

Only Facts Are Made Available

The Association assumes full responsibility for the accuracy and truthfulness of information it makes available. We fully realize the high obligation for real facts and correct interpretation. Mistakes and errors do occur, but every effort is made to prevent and correct them. Your statistical research organization has been developed until it is among the best maintained by any basic industry. The statements and publicity of the Association are made from this background of factual information, widely gathered, critically available, and competently interpreted. Our objective is to make facts available, confident that they will speak for themselves in securing for this industry a fuller public understanding of its problems, accomplishments and services.

You rightfully take pride in the men and women associated with you in your respective organizations. I wish you to share the great pride and confidence which I have in my co-workers at Headquarters. Not one of you is surrounded by more loyal, enthusiastic and untiring aids. We derive happiness from service to you, and our real rewards come through contributions to your success.

The Industry's Main Asset

We expect the registration of the convention to be between 10,000 and 11,000. As I have watched this great crowd gathering, as I have observed the hail greetings and comradery on the Boardwalk, as I stand before you this morning, one thought persists—that the industry's main asset is not its power plants, not its transmissions and distributions, not its investments in physical equipment. The greatest asset the industry has is the enthusiasm, character, loyalty and ability of the 270,000 men and women who are engaged in it. I would that we appreciate more than ever these rich human values, realizing that from them has come all the progress that has been attained, and in them lies all our hopes for the future.

PRESIDENT ARKWRIGHT: An indication of the good job that Managing Director Clapp always does.

There is no subject of greater consequence and importance to us than proper rate structures and correct principles of rate making and rate regulation. We are fortunate to have on the program a gentleman who has had a great deal of experience in rate regulation, rate schedule making. He is an authority on the subject. It is a privilege to have him present, and it is an honor to present to you Hon. William L. Ransom of Whitman, Ransom, Coulson & Goetz, who will talk to us on the subject of The Public Right as to Electric Rates. Judge Ransom!

THE PUBLIC RIGHT AS TO ELECTRIC RATES

By WILLIAM L. RANSOM

Of the New York Bar;
Member Whitman, Ransom, Coulson & Goetz

I have been honored by your invitation to take part in the program of this impressive convention, marshalled under your leadership, Mr. President, and that of the other officers and the staff of this association. You, sir, have been a tower of strength to this industry, during what has seemed at times a transitional and troubled year. The members of the industry have come increasingly to respect your counsels and love you as a friend. Perchance that respect and affection will persist, in spite of your suggestion of electric rates as the topic for my remarks.

I think you will all agree with me that this subject of electric rates does not lend itself well to discussion within a fifteen-minute period, before so large a General Session. With other speakers with less technical subjects about to follow, as well as a talking movie, I shall avail myself of the opportunity of referring to the subject only in a rather sketchy way, and in preparing my remarks for later publication I may refer to some angles of the subject in greater detail than is possible here this morning. [Judge Ransom's complete paper follows.]

Discussion of Electric Rates Is Growing

There are signs of a growing discussion of the subject of electric rates. So far this has been largely technical although enlightening in character, has been carried on chiefly by company representatives, and has proceeded for the most part from the point of view of the electric companies, their operators and their investors, and what the companies have a right to expect from the rates which they charge the public.

Now there are multiplying indications that this discussion will soon reach a further phase. There are manifestations of a growing public interest and consciousness as to electric rates, their forms, and their economic effects as limitations on the service which electrical energy may perform. The emphasis may soon shift to vital questions of what the public has a right to expect as to the rates which customers pay. Needless to say, I am not at all referring to the occasional agitations conducted by demagogues, who dangle before voters the illusion of cheapness for its own sake. Except, perhaps, for one or two conspicuous instances, there is less of this kind of discussion now than for several years past. Such outbursts rarely have had any practical relationship to the rate reductions which have steadily taken place, throughout the electric industry; more often, these unreasoned agitations and consequent litigations have actually delayed reductions which would otherwise have taken place and have seriously obstructed normal improvements, of public benefit, in the rate structures of the utilities affected.

Consciousness of Rates

But I believe that there is an increasing volume of reasoned and beneficial consideration of the subject of electric rates, by customers and by representatives of the public interest. By this, I do not at all suggest that present discussion lacks vigor or that it proceeds from any undue friendliness to the companies. Although reasoned, it is aggressive and often based on misinformation and false hypotheses. Nevertheless, it exists, is increasing, and must be reckoned with, as a reasoned discussion from a public point of view. Perhaps, naturally, this consideration has been most manifest in the public service commissions of the various States and in their expert staffs, but there are evidences that customers also are becoming conscious of electric rates and their relationship to home life and to industry and commerce. Rates and forms of rates are no longer taken wholly for granted, in all communities; and what we may call this consciousness of the rates and of the effect of rate forms is leading to an inevitable questioning whether electric rate-making has so far kept fully apace with the tremendous progress in electrical engineering and corporate organization. You need not be reminded that the dependence on electric service has become such that your electric rates, their forms and amounts, vitally and continuously affect the daily home life of this country and determine its industrial development, to a far greater extent than do tariff schedules or tax bills or the prices charged for the products of any other industry. Tasks of statesmanship in rate-making are undoubtedly ahead. The electric industry will soon be subject to increased pressure and insistence from the State commissions, for needed changes in rates and rate structures.

For my own part, I believe that the electric industry does and will welcome most cordially the challenge of any fair scrutiny of its rate structures from the point of view of the public interest. It will prepare to meet and deal with any kind or extent of public discussion and criticism, whether fair or not. In the long run and the last analysis, the public right and the real public interest has been, and should and will remain, paramount as to anything pertaining to the electric industry. This inheres in the very nature of the essential service which you furnish and the far-reaching economic consequences of your rate schedules. You have always to take these elements into account in making and changing rates. This great industry could not, if it would, assume a merely passive attitude, a rôle of non-resistance, and compel that the leadership and initiative in these vital matters shall come from the pressure of public authorities. To whatever extent the public now or hereafter has a right to expect progress in the matter of electric rates, the responsibility for the prompt proposal and explanation of adequate changes rests inescapably with the utilities. Therefore it may be fitting that in this most representative Association, an effort shall be made to perceive and point out the elements of public interest and concern.

Analyzing the Discussion

I have lately been trying to make some analysis and appraisal of what is being said by way of fair and serious-minded comment, criticism, and suggestion, as to electric rates. Before presenting any of the results of such study, I think I ought to say two things, because they express a point of view which undoubtedly affects my analysis:

1. It is very dangerous, and it may be altogether too early, to try to generalize as to electric rates throughout this country. The rates and rate practices in one locality vary sharply from those in many others, and there is a wide diversity of experience and reasoned opinion. Any analyst is in the utmost peril of giving undue weight and emphasis to what has been done and said in the localities with which he is most familiar. Almost any present generalization that may be undertaken as to electric rates, beyond their steady decrease as consumption has increased, is likely to be no more than partially true, if true at all, and there will be numerous and impressive variants and exceptions. As some of you know, the vicissitudes of the law have led me to see a good deal of public utility problems, from several angles of relationship and responsibility—in municipal government, in the legal work of a public service commission, and as counsel for companies. My work has brought me into contact with practically all types of public service companies, in a good many cities and States—electric, gas, water, communication, and various types of transportation. If this diversified experience has helped me to see public utility matters from a point of view which is at all broader than that of one locality or branch of the industry, probably another result has been to deprive me of power to dogmatize and declare ready formulas for the convenient solution of the problems which beset you. So I shall refer to these rate questions rather tentatively, and not at all dogmatically. My purpose is, frankly, to present them anew as questions for consideration and discussion, and I have neither pride of opinion nor finality of opinion concerning them.
2. I am not one of those who believe that the operations or rates of this industry should or can be forced into any strait-jacket of uniformity. The electric utilities of this country have grown up as local institutions, each meeting its own community needs according to the divergent conditions and the best judgment of its local managers in conjunction with the public supervisory authorities. The essence of the situation has been friendly, cooperative relations between the utility and its locality, with the State power in the background, likewise exercised in such a manner as to take account of local conditions, moods, and needs. Continuance of this wholesome local responsiveness, so far as may be, is of great benefit to the industry and those whom it serves. For my own part, I am keenly cognizant of practical difficulties and dangers which would inhere in regulatory pressure, or even pressure from central holding-company management, for too much uniformity or standardization.

Nevertheless, many changes have come about; the earlier conditions of the industry have been sharply altered; and it may be that the public interest will sooner or later point out to you the avenues of some needed progress in your rate-making. These may here be explored without in any way accepting the view that all of them should immediately and uniformly be adopted by the utilities.

Elements of Question and Challenge

Some of the elements of question and challenge which are coming to the electric industry may be briefly outlined:

(a) There is sometimes a serious and fair-minded assertion that existing electric rates must be too high. This is said in the face of the fact that electric rates, per unit of service, have been steadily and generally reduced from year to year, despite sharp increases in wages and material costs, and the fact that the net earnings of the electric utilities are and have been kept substantially less than an adequate return upon either the present value of the properties or the actual investment therein, taken on any basis of valuation or return that could reasonably be defended. Among the seven general classes of living expenses listed and analyzed by the National Industrial Conference Board, electricity is the only one which shows a unit price below that of 1914. The decrease has been about 14 per cent, without giving effect to the lessened purchasing power of money, which would make the percentage of actual reduction still larger. The figures which have been carefully compiled from all available sources, many of them governmental in origin, confirm the fact that existing electric rates yield an annual return of less than seven and one-half per cent on the investment, and, of course, a substantially smaller percentage of return upon the present value of the useful property. Despite these facts, there is oftentimes a manifest feeling that electric rates, or at least the cost of electric service, are too high.

(b) On analysis, any assertion that electric rates are too high is usually found to be unsupported by any demonstration or conclusion that the net earnings as a whole are excessive. Oftentimes the assertion finds its pretext and pretended justification only in wholly extraneous and irrelevant considerations, unrelated to the operating companies, their properties, their costs, or their net earnings. In many instances, however, the feeling that electric rates are too high is a feeling that the cost of electric service has become too high in the sense that the increased quantity of current now used by many customers costs too much and has not been reduced sufficiently as the quantity has increased. There is also an impression that the existing rates or their forms tend strongly to prevent the use of electrical energy for many purposes in homes and industries which would gladly make full use of electricity, for various additional functions, if the rates or rate structure permitted it, within the limits of a reasonable total cost for the total electrical service rendered.

(c) On further analysis, in most or many of these instances, it appears that the utilities could well afford to supply electrical energy to these homes and industries, for all purposes (including these added uses), at unit rates producing a total cost which they could well afford to pay, and that the managers of the utilities would, in fact, very much like to obtain the additional volume of sales which these full-use customers would ensure.

(d) In some localities, there is also a somewhat vague feeling, increasing but not yet very militant, that rates and rate schedules are adversely affected by the fact that some electric companies furnish large quantities for resale at unregulated rates by unregulated middlemen, depriving the regulated utilities of their normal diversity of retail and wholesale business and compelling higher wholesale and retail rates.

(e) Over and beyond these questionings as to rates and their forms, there is oftentimes a public feeling that electric rate structures and rate schedules are needlessly complicated and prolix, beyond the comprehension of the customer, and lending themselves to misunderstanding and misrepresentation. There seems to be an increasing amount of questioning based on comparative rates, in different localities and within the same general area and system—a resentment against unexplained local variances in amount and form, a feeling that rate-making has not yet caught up with the larger operating and corporate units which have become characteristic of the utility systems.

Reviewing Questions of Public Right

Within the available limits of time, I can here comment only very briefly upon these elements of criticism and questioning, advanced from the point of view of the public right and interest. In part for the same reason of time, I shall refer to these several questions in which may seem to you, as to me, the reverse order of their importance, placing first for brief statement the more superficial public criticisms of present rates and schedules.

It is suggested that the public right reasonably calls for:

1. *Greater simplicity of rates and rate schedules:*

There seems likely to be an increasing amount of regulatory pressure, backed by considerable customer opinion, to the end that electric rates and rate schedules shall become more simple and understandable. The public has a right to expect that your rate structures shall not be needlessly complicated or prolix, and that the terms and conditions on which your essential service to the public will be furnished, shall be stated as clearly, explicitly, and simply as possible, so as to be comprehended by customers as well as by rate technicians. Too many rate structures and rate schedules are still an evolutionary growth, made and amended from time to time to deal with changing conditions, and in a makeshift way. The result too often is more or less a patchwork, needlessly intricate, and lending itself to public misunderstanding and customer irritation. In other business fields, under the leadership of the Department of Commerce, there has been great simplification of forms, standards, and types, which has enabled salesmanship to make effective concentration upon those best suited. May not the electric utilities gain added public commendation through similar steps as to their rate schedules and rate structures?

2. *Uniformity of rate forms, and even of rates, over larger territorial areas:*

From some of the regulatory commissions, there has come recently the demand for greater uniformity as well as simplification, at least as to the forms of rates. Beyond a doubt, this suggestion presents serious practical difficulties, in view of the diversified conditions and the general prevalence of customer satisfaction under the varied forms of rates now in use. Uniformity, if pressed too far for its own sake, might lead to disturbances and irritations more serious than have ever arisen from lack of it.

But the question is squarely propounded whether your rate-making has kept pace with the growth of your corporate systems and the widening of the areas served from a central station? We all know that comparisons of rates, in different and distant communities, have been used as bases for unfounded inferences and attacks. Marked differences in rates or rate forms in nearby areas served by the same utility system, perhaps even from the same central station, have sometimes lent themselves to criticisms which are not as readily refuted. In putting together larger units of operation and management, the electric utilities have generally been quick to give to the public the economies and advantages which flow from such larger units in engineering and management; but has the same thing yet been done to an equal or appropriate extent as to rate-making? Too often, as to rate-making, the anachronisms which arose in the days of local ownership and management have been perpetuated despite the consolidations. The suggestion is made that the outlying locality may well be averaged in with the more congested areas, and the rates made alike for each. This is deemed to follow logically from your own creation of the larger units. You may need soon to consider whether the growth of this industry has not reached the point where greater uniformity in the forms of rates may advisably be sought and promoted, over larger territorial areas? Instead of sharply differing rates and rate forms for each locality and local condition within the territory served, does not the great growth of the electric business entitle the public soon to look for progress toward a greater uniformity in form, and even in amount, over larger territorial areas, particularly including those which are partly suburban or rural in character?

3. *Rates based on service direct to the ultimate user of electric service:*

Here is an issue you may soon have to face squarely. Many rates and rate schedules in the electric industry remain seriously affected by the fact that a large part of the energy supplied thereunder by the public utility is for purposes of resale, within its franchise territory, by unregulated middlemen, who, in turn, resell the energy to those who would otherwise be customers of the utility and would help give to the latter the normal diversification of its business, as between wholesale and retail classifications and in other respects. This issue is already before various commissions and courts, and the decisions so far have, I think, been uniformly adverse to the practice of the supplying of electricity by non-utilities, at rates and under conditions of service not controlled by law. Beyond a doubt, this practice, where it exists, throws the rates and rate structures of the utilities out of balance, and keeps both retail and wholesale rates higher than would otherwise be necessary. I submit for consideration that the public will be better served by the utilities themselves, in direct relationship and responsibility to each user of electric energy, and that within their franchise territories the utilities ought not to make their rate schedules and rate forms such as to permit resale of their energy by non-utilities, at prices not subject to public regulation and control. There is no need or room for a middleman, in the selling of electric energy generated by a public utility. The rates charged to the public should not be burdened with his profits, and the public should and will benefit from his elimination, in the communities where commercial, industrial or residential sub-metering has obtained vogue. In my judgment, the utilities have only themselves to blame for permitting the establishment of a rate practice which first disadvantaged the public but now threatens serious consequences to the utilities themselves.

4. *Rates reasonable in amount and in such form as to enable electrical energy to perform all of the labor-saving and comfort-giving functions for which it is economically suited:*

This phase of the public right is basic and clearly the most important of all. It is axiomatic that an electric utility is entitled to charge rates which will yield net earnings amounting to an adequate annual return upon the present value of the property which it devotes to the public service. That is the constitutional right of the utility, which may, nevertheless, in the exercise of its own business judgment and discretion, put and keep in effect rates which yield net earnings amounting to less than a fair return. That is commonly done by the electric and gas utilities, and is a right and function of sound management. There seems little or no danger of losing sight of this principle of constitutional protection, declared and enforced by the State and Federal Courts; and the public itself has commonly come to realize that in the electric industry, the rates must be kept such as to yield revenues enabling the continuance of the best possible service and the making of extensions and improvements as fast as necessary to that end. The public has not often made the mistake of destroying ability to serve and grow, through any desire to seek rates which are merely low and cheap. Adequacy of net revenues, as essential to the best possible service, the integrity of investments, and a liberal policy of extensions into outlying areas, is the right alike of the utilities and of the public which they serve.

But the electric industry cannot expect to grow and hold public confidence as to its rate policies merely by demonstrating periodically, before some commission or court, that the total amount of net earnings of this or that company, or system, or the industry as a whole, does not exceed the constitutional assurance of a fair return. Truly enough, the rate structure and the return from it should be envisaged as a whole, but the right to make competitive rates in the exercise of sound business judgment and the right to compel classes of customers to pay their own way may alike be insisted upon. There are signs of public questioning of ancient forms of rates still in effect.

It is the right of the utilities that rates shall be kept such as to yield an adequate return, and such an adequacy of utility revenues as a whole is also in the public interest, no less than the prevention of excessive charges. But there is no public right of any class of utility customers to be served at a loss, and no right of any class of customers to insist that a substantial part of the cost of serving them shall be assessed against and paid by other classes of customers. It is the economic necessity that the rates shall defray the costs of the service and yield a substantial annual return. Utilities may, and often do, secure for themselves some illusion of popular or political favor, by cutting the rates for the more numerous classes of their customers so low that the deficiency in bare operating costs, as well as return, has to be made good in large part by less numerous groups of customers and in part by utility investors. I do not hesitate to state my personal belief that any such practice in rate-making violates the public right.

The Most Important Rate Problem

As I see it, the most important rate problem confronting the electric business today may be denoted, in barest outline, by the following factors:

(a) The existing rates do not yield excessive revenues or returns. On any basis of valuation or return, the net earnings of the electric operating companies are at a lower rate of return than is the constitutional right of the companies. The amount of investment required, per kilowatt of generating capacity, is increasing; and the rate of return yielded upon even the investment is decreasing. The averaged rate, per kilowatt-hour of electrical energy sold to the public, is steadily decreasing. These tendencies would create a serious problem for any industry.

(b) There are many uses for which electricity is well adapted, in the homes of America and in its commerce and industry, from which electricity is to a large extent excluded by its present rates and rate forms. How many of us have occasionally an opportunity to contrast the conditions of home life, in homes to which electricity has not yet been made available, with those in which electrical energy has come to perform many of the functions for which it is suited? There are so many things which electricity can do, for comfort, convenience and good cheer, in lightening the drudgery of household tasks and making new comforts and conveniences available in even the humblest homes. The aid of electricity has become a vital part of the American standard of living; its economic availability for full use is a part of the public right. There are millions of persons who would like to make full use of electricity, particularly in the homes, but who find themselves unable to do so, economically or at all, under the present rate schedules. This presents at once the duty, and a large part of the opportunity, of the electric industry.

(c) This situation seems the more surprising and lamentable when analysis discloses that the electric companies could, in fact, well afford to supply to these full-use customers all of the electrical service they desire at a total annual cost which they recognize they could well afford to pay. If these full-use customers were called on to pay only the cost of serving them, the rates for such use could be made low enough to remove the economic barrier to the taking on of this business. The electric companies could do this without decreasing their present net revenues. They, in fact, greatly need this additional volume of business. They are not fulfilling the whole of their public function if they do not render the service which would call for it.

(d) From the above it clearly appears that the present barrier to electricity's full service in the home and in industry lies in the *forms* of the rates rather than in the total net revenues which they yield. The essential thing is that the utility shall not compel their full-use customers, in the homes and in industry, to continue to pay also the losses incurred in keeping electrical service available, at less than cost, to those who choose to make only a limited and occasional use of electricity, regardless of the price. If the present rate structure makes a home-owner pay an average of, let us say, six or seven cents a kilowatt-hour for a relatively small quantity of energy, whereas he would be glad to use a much larger quantity for a variety of labor-saving uses, for which he could afford to pay an average of three cents, the rate schedule must be seriously at fault, provided the company could well afford to supply him the larger quantity of energy at the price he could afford to pay.

(e) Perhaps the most potent factor in excluding from the American home the full service of that most efficient aid to comfort, leisure and convenience has been and is the form of rate under which all of these full-use customers, regular and substantial users of electricity in the home and factory, have to make good the heavy deficiency incurred in serving many casual, convenience or limited users, who wish electric service kept continuously available to them, but do not wish to use it in regular or substantial quantities throughout the year. This anomaly has readily produced the condition under which a rate structure yielding less revenue than the company is entitled to, produces kilowatt-hour rates nevertheless so high as to penalize the regular and substantial users and bar the way to full use of electricity in the American homes and in American industry.

Violating a Public Right

I am not asking you to take my word as to whether a public right is here involved. The United States Court has passed upon that question in a case* involving gas rates but presenting the same question. A utility customer, which wished to become a substantial and regular user of gas, brought suit against the gas company. The plaintiff customer was being charged a flat or straight-meter rate, paid by all customers alike for each 1000 cu. ft. of gas consumed. Those to whom gas service was kept available paid nothing at all unless they consumed some gas, and if they used gas only occasionally and in slight quantities, they paid only the same flat unit rate as did the regular and substantial users, in the homes and in industry. The plaintiff customer claimed and proved that such a rate structure violated the actualities of the relative costs of service; that the flat rate compelled the regular and substantial users to pay excessive sums for gas service; and that *the property rights of the customer* were violated by a form of rates which prevented it from making regular and substantial use of gas in the quantities which he could economically utilize.

The Federal Court held, in an opinion by Judge Hazel, that the customer's complaint was sound in law; that the right of the customers to service at a reasonable rate, without advantage or disadvantage as compared with other customers, is in the nature of "a property right which entitled the parties to equal protection and treatment"; that this right of the public was violated by a flat rate which failed to take into account the actual costs of serving different classes of customers; and that a statute which compelled the continuance of such a flat rate and prevented a service charge violated the constitutional rights of the customers. The Court said:

> "No essential difference is perceived between one who actually uses the gas, paying an inordinate rate, and one who in good faith desires to become a customer but is estopped by an excessive exaction."

Here, then, is an economic maladjustment, a serious infringement of the public right as to electric rates. It may not be necessary here to go as far as the Court did in holding that an unsound rate structure violates a *property* right, but you cannot escape the fact that it violates a *public* right. Until this condition is changed, all of your sales campaigns and educational efforts under the auspices of this Association will encounter an inexplicable resistance. I have heard utility executives say that they did not care about the *forms* of their rates, because they could not earn more than a fixed return upon their useful property. Hence they concluded that the forms of their rates and their economic and social effects upon American life were "somebody else's business"—the concern of the commissions and other public representatives.

I do not believe that any such attitude of indifference can long be taken in this industry. Beyond question, the public, your customers, have a right to expect you to take the lead in making the rate readjustments which will remove these unnatural economic barriers to the full use of electricity. This will require leadership and action, courage and patience. You are as aware as anyone else of this condition and this need. You have been talking a good deal as to doing something about it, and some companies and groups have made real progress. It remains to be seen whether the industry generally will translate its convictions into action, or will wait for compulsion in the public interest.

Changes in the *Forms* of Rates Essential

In my remarks this morning, Mr. President, I have said no word to counsel any utility to embark upon any program of reduction in its rates, much less in its net revenues. The matters discussed do not relate to the amount of the net earnings or the rate of return at all. Beyond question any utility should resist to the uttermost any effort of public authorities to compel it to forego the adequate revenues which are essential to good service and are the right of its investors. My plea here is only for such changes in the *forms* of rates as will enable this servant of mankind to do those things which are the public right.

This is more easily said than done, as many of us have found. It generally means the giving up, for a while, of those spectacular and popular reductions in the "top" rate. These have been responsible for many of the mal-adjustments in present rate schedules. To cope with the present situation means frank recognition of our debt to that little group of serious thinkers—men like Henry L. Doherty in the gas industry and Samuel Ferguson in the electric—who have pioneered with their studies of utility rates and allocated costs. A great deal remains to be done along these lines, and the national leadership of this Association will be appropriate. The situation calls for an infinite amount of patient effort to explain to customers the significance of the changes and the betterments for which they clear the way. This is no inconsiderable task, in an industry which has placed its emphasis so strongly upon other things; but I believe that it can and will be done.

PRESIDENT ARKWRIGHT: We are most grateful and most appreciative to Judge Ransom for his fine analysis and address on this subject.

The next feature on our program is a novel one at conventions. We owe our having it to two particular individuals and interests. It wouldn't have been possible to have obtained it without the generosity and cooperation of placing at our disposal the facilities and the organization of the Western Electric Co., nor could we have obtained this without the effort, the interest and the work of Mr. W. H. Onken, the senior editor of *Electrical World*. I will not attempt to tell you what this feature is. It can best be told by Mr. Onken himself who went to Europe for this purpose. He did better than that. He had arranged to get certain particular people to participate in the features, but through unforeseen circumstances he couldn't get a single one of them. Instead of coming back empty-handed, he went out and got better ones. Mr. Onken will present this feature.

---

* *U. S. Light and Heat Corpn.* v. *Niagara Falls Gas and Electric Corporation*, 23 Fed. (2nd) 719.

INTRODUCTION OF FOREIGN SPEAKERS VIA "TALKING MOVIES"

By W. H. Onken, Jr.

Senior Editor, Electrical World

This year marks the fiftieth anniversary of the invention of the electric incandescent lamp by Mr. Edison, and inasmuch as the electric lamp was but the forerunner of a system of electric generation and distribution of low tension, also invented by Edison, it is but natural that the electric light and power industry of this country should celebrate the event.

Now, a prophet is not without honor save in his own country, and President Arkwright, President of the National Electric Light Association, conceived the idea that possibly some foreigners of note might be induced to pay a tribute to the beneficent work of Mr. Edison, and to tell of what electricity has done for civilization. The question then, was who to invite and how to secure them. It would have been pleasant and entertaining to have some outstanding foreigners appear in person on this platform, but that was too much to expect. To have them express their sentiments in writing would be to have robbed their thoughts somewhat of their personal charm and magnetism.

Then the idea of a talking movie suggested itself. Here was something electrical that might measure up to the occasion, a moving picture surcharged with action and personality, and animated by a living, human voice. The idea, to be sure, was novel and dramatic. The Movietone had never been used before for such a purpose, and it is only natural that a progressive and enterprising organization like the National Electric Light Association should be the first to employ it for this Golden Jubilee Celebration.

Through the courtesy of Mr. McGraw, I was loaned to the National Electric Light Association and sent to Europe to secure speakers and Movietone records, and I was fortunate in getting in touch with people possessing a vaster vision of the world, and to whom the youth, confidence, energy and vigor of the United States were not unknown. These men graciously consented to make movietone records for this celebration.

They include Sir Kengo Mori, head of the Japanese Debt Commission now in session in Paris, Dr. Alberto Pirelli, Milan, Italy, President of the International Chamber of Commerce, and Sir Ernest Benn, economist and publisher, of London. In addition we have been very fortunate in securing a Movietone record of Mr. Edison himself. One of these records will be shown at each of the morning sessions during the Convention.

THE SUPERIORITY OF PRIVATE ENTERPRISE*

By Sir Ernest Benn

Economist and Publisher, London, England

The property problem—the question as to whether wealth or property should belong to the individual or to the community has been discussed and debated ever since the days when public affairs first became the subject of thought and conversation. Plato advocated the public ownership of property and for twenty centuries people who were not so well off as they would like to be have argued that there was something wrong with private ownership.

The argument still goes on today, and yet the vast bulk of all the property in the world is still in private hands. We are asked to believe that the whole world has been wrong through all the ages, and that there is a better way—the way of public ownership. It wants some courage in face of the accumulated experience of mankind to carry on this old argument, but Socialists and Revolutionaries make up in courage what they lack in brains.

When property consisted almost entirely of land and cattle and natural products there was a suspicion of a case for public ownership, but today when property and wealth are 95 per cent brains and 5 per cent nature, public ownership is the road to the end of our civilization.

Before wealth or property can be OWNED it has to be MADE, and nobody will suggest that Society can make anything. The making of wealth is beyond any question the exclusive function of the individual. The best society or community or state from the economic point of view is the one which has amongst it the greatest amount of wealth.

The best public policy, therefore, is that which will encourage the making of the maximum of wealth.

If, for instance, six people can live in comfort in one house, a community of 60,000,000 people will require 10,000,000 houses. If only 8,000,000 houses exist a discussion as to their ownership is apt to obscure the real problem—how to get another 2,000,000 houses built.

Public authority can *own,* but it cannot *make.* It only owns what it can extract by force from the individual who does the making. Public ownership, therefore, acts as a discouragement to those invaluable citizens who are by nature makers of wealth, and encourages the incompetents, the parasites, the passengers, the incapables and the pauper-minded.

---

* Presented as a "Talking-Movie."

I have said that before you can own wealth or property it must be made, but there is a third consideration—it must be cared for, preserved, maintained and guarded from depreciation.

A public authority, which has confiscated—for all taxation is confiscation — which has confiscated wealth, values it so lightly and cares so little for it, that it will throw it away on the slightest provocation. The world is littered with the ruins of public works that have been discarded.

The civilization of each generation through the whole of history has rested upon the private property made, owned and cared for by the previous generation. There is no exception to this universal and age-long experience.

On the other hand, each generation has been handicapped with the debts of its forefathers, represented only by the blunders of public ownership.

The private individual tends always to acquire wealth—real wealth—which remains in the community for its comfort. No community has ever acquired anything worth mentioning but debts—the opposite of wealth.

Marshall, in the "Principles of Economics," says:

> "The tendency of careful economic study is to base the rights of private property not on any abstract principle, but on the observation that in the past they have been inseparable from solid progress, and that, therefore, it is the part of responsible men to proceed cautiously and tentatively in abrogating or modifying even such rights as may seem to be inappropriate to the ideal conditions of social life."

The property in the hands of public authorities of the world today is not worth more than 5 per cent of the amount of the debts of the same authorities.

That, after all, is quite natural, when we remember that it is nobody's business to look after public property.

The argument, therefore, boils down to this. The economically perfect society wants the maximum of wealth—houses, railways, electricity plants, steamships, machines and numbers of other things. All experience shows that the private individual through private ownership is the only agent that can be trusted with these things. He makes them, he cares for them, and he passes them on, free of debt, to the next generation.

Can there, then, be a shred of doubt in the mind of any reasonable man that the public good, the well-being of society, the advancement of civilization, the raising of the standard of life of the people, and all the highest and the best of economic aims can only be secured by a firm adherence to the principle of PRIVATE OWNERSHIP.

PRESIDENT ARKWRIGHT: I leave it to you if it isn't worth while. I think to praise it would be to detract from it. It is beyond praise. Again there can't be any possibility of a suspicion that Sir Ernest Benn's sentiments are not his own.

The next feature of the program is an address by Mr. J. F. Owens, the Chairman of the Public Relations National Section. Mr. Owens is also a Vice-President of your Association, and not like I was when I was a Vice-President; he is a working member of your organization. He has given a great deal of his time and talent to this Association and for the benefit of this industry, not only through the past year but for many years preceding that. I take great pleasure in presenting to you Mr. J. F. Owens, Vice-President of this Association and Chairman of the Public Relations National Section. Mr. Owens is also of the Oklahoma Gas & Electric Co., of Oklahoma City, Okla. Mr. Owens! (Applause).

REPORT ON PUBLIC RELATIONS NATIONAL SECTION

By J. F. OWENS, *Chairman*

It has been said many times, but will bear repetition, that, unlike most other businesses having an intimate bearing on the public well-being, the electric light and power business has grown up within the remarkably short space of forty years and in that length of time has assumed staggering proportions and a relatively vital importance in the financial, social, industrial and educational life of the country. It might almost be said that it is the warp of our modern social fabric.

No small part of the progress made has been linked with the activities of the National Electric Light Association, of which the Public Relations National Section is a major division.

Purposes of This Section

The Public Relations National Section is organized for and devoted to the purpose of encouraging member companies to disseminate information that will give their employees and the public an understanding of the problems involved in the financing of electric light and power companies, and the furnishing, at fair rates, of continuous, dependable electric service. Its major purposes are:

To encourage member companies in so developing and training members of their organizations that employees will be able to interpret the industry to its customers and the public;

To act as a clearing house through which such ideas and practices as are found helpful in one company or section of the country may be made available to all;

To bring about and maintain a ready acceptance by the public of sound securities issued by the industry;

To be prepared, through study and research, to furnish accurate information on national problems mutually affecting the industry and the public;

To foster and develop cooperative work with legitimate agencies for the dissemination of such information, to the end that friction born of misunderstanding or misrepresentation, shall be eliminated and the stability of the electrical industry be maintained.

The Section's Work

In the main, the work of the section throughout the past year has consisted of the carrying forward of plans and policies evolved and partially developed during the preceding year.

As in the past, it has operated mainly through the eight major committees. These committees are:

Cooperation with Educational Institutions
Customer Ownership
Industrial Relations
Information Bureaus
Manufacturers' Advertising
Public Speaking
Relations with Financial Institutions
Women's

Through the investigation still under way by the Federal Trade Commission, the activities of some of these committees have been the subject of discussion and editorial comment in the public press, and for that reason it is felt that in presenting this report a review of their purposes and functions deserves special attention.

The Cooperation with Educational Institutions Committee and the Committee on Information Bureaus have been, during the past year, the focal point of attack from certain sections of the press.

The Committee on Cooperation with Educational Institutions was established in 1923. Its purpose, as set forth in the Organization Personnel, is "to bring about a closer understanding and better methods of education with reference to public utilities in the higher institutions of learning."

At the beginning, it proceeded carefully and somewhat slowly in mapping out its functions and establishing a concrete program. This is justified as a matter of policy in any new undertaking along an unmapped course, and is entirely appropriate, first, in connection with an organization voluntary in its nature, and, second, in connection with any program which ultimately must be determined and approved by educational authorities of the nation.

Coordinated Organization Planned

In respect to the work of this committee in the past, it may be said that there never has been and is not even now a coordinated organization representing both the National Association and its geographic and State divisions. This is not due, at least primarily, to any lack of appreciation of the importance of the matter itself, but, as pointed out in the National Committee meeting in 1926, it is primarily due to the lack of establishment of a national program and correct guiding principles of cooperation in the public interest on the one hand, and meeting the approbation of educational authorities on the other. At the 1926 meeting of the committee, it appeared very clearly that two things were necessary:

First—the mapping out of a cooperative program, useful in itself, and meeting the approbation of educational authorities.

Second—the establishment of such machinery within our own organization, always recognizing its voluntary nature, as would be best calculated to carry out the program that was finally established.

It was with the thought of ascertaining the extent to which this cooperation had existed and with mapping out a program through which it might be promoted that it was finally determined by the committee, which had already made recommendations as to cooperation, that the definitive program should be based upon an actual survey of the situation in respect to cooperation in the various parts of the country, and this led to the securing of the services of Dean C. O. Ruggles, then with the Ohio State University, for the purpose of making such a survey. This survey has been carried out, and a report, made by the educators of the committee, will be forthcoming in the near future.

During the last year there has not been a meeting of the full committee. The educational members have been in conference with Dean Ruggles in connection with the survey. The matter of organization within our own ranks seemed to be one which should primarily be given study by our own representatives, and the utility representatives on the committee met on March 4 and 5 of this year. They made a report and recommendation for consideration by the Executive Committee of the Public Relations National Section. This report and recommendation is as follows:

The Committee's Report

"This committee has considered the general situation in respect to cooperation by the industry with higher educational institutions. In our opinion it has been clearly demonstrated that this cooperation is not only of mutual benefit but that it serves the public interest and should be continued and further developed.

"There are, however, certain essential facts which we believe worthy of the most serious consideration. During the last year, this industry has been subjected to criticism in relation to some of the cooperative activities, and there exist in some quarters a misinterpretation of our motives and the opinion that there has not always been shown a complete appreciation of the high ethical standards which must at all times prevail in such activities. This committee is convinced that modification of our present organization would reasonably provide in the future against any occasion for adverse criticism of cooperative relationships and further strengthen the field of useful cooperation.

"The actual functions of cooperation have been generally exercised by organizations neither directly related to, nor cooperating with, this committee. The committee has lacked such contacts with State or local cooperative agencies as are essential for the formation and promulgation of national policies.

"We recognize the fact that cooperation cannot be exercised efficiently or in the public interest merely through a centralized committee out of touch and inadequately acquainted with local conditions, demands or sentiments. Our organization rests upon a basis of voluntary cooperation as its mainspring. The major responsibility must remain local and any attempt at centralized control would be ineffective. A survey of the entire situation leads us to the following conclusions:

"First: That it is desirable that there should be established in an authoritative way guiding principles to control future cooperative activities, such principles being in general those which should prevail between educational institutions on the one hand and electric light and power companies on the other hand. It is our belief that such principles can be best declared in an authoritative way by educational administrators of national standing and experience. We recommend to our Association the furtherance and encouragement of such measures as may be best fitted to secure such declaration of principles.

"Secondly: We recommend more efficient cooperation within our organization to assure sound development of relations with educational institutions, free from legitimate criticism, and such as to sustain with the educators that confidence in our activities and purposes that must at all times prevail if the best interests of the public and all concerned are to be served. We believe that the following plan will lead to this result without trespassing on the full measure of local responsibility in such activities and we recommend that steps be taken to put the plan in effect in the immediate future.

"We recommend that each geographic representative of this committee take up with leading executives in each State within his division the initiation of such steps by the utility executives in connection with administrative heads of educational institutions as will bring about in each State the selection of an industry representative satisfactory to the educational institutions to whom in each State there shall be referred for approval all proposed cooperative activities.

"We further recommend that such representatives be requested to act as the State representatives on the geographic division committee of this committee."

These recommendations have been endorsed by the Public Relations National Section Executive Committee and by the Executive Committee of the National Electric Light Association.

Educators' Attention Deserved

Certainly, our industry occupying such an important place in the scheme of things deserves the careful attention of educators. So rapidly has it grown and so rapidly is it developing that it is almost beyond the power of those in intimate contact with its development, those who are wont to call themselves a part of this development, those whose brains and minds and hearts are given to it, to keep abreast of its progress in all of its phases.

If this business of ours is destined to play in the future even a more important part than it has in the past in the social, economic and industrial life of the nation, it is important enough to have brought to bear upon its development the best thought of the best trained minds in the nation. It is important enough that the youth of the land, who are being poured out annually from the colleges and universities of the country into this whirlpool of the present social order, are allowed to drink from the running stream of current facts, rather than from the stagnant pool of worn out ideas, pools poisoned as they frequently are by the sophistries of discredited theorists. That the youth of the land going forth from our great universities, to be the moulders of public opinion in the future, should have the benefit of facts relative to the evolution and operation of our business goes without saying.

If the students of the universities and colleges are to drink from the pure stream of current facts, they must have free access to the only reliable source of information: the great operating utilities of the electric light and power industry.

It is through these companies that the product of the minds of thousands of men and women, who have been and are engaged in research and study into nature's laws; that the product of manufacturers, who have taken these laws and fabricated out of them instruments through which the laws might be applied for the comforts and conveniences of mankind, have found practical application to the every day needs of modern life of the mechanical genius of the one, and the discoveries of the other.

Companies the Logical Source for Information

What better than the operating companies can be found to serve as a basis for authoritative information of electricity to modern day needs? Where is the educator to go, if not to the electric light and power companies, for the information that he needs in fitting the young minds in his charge to cope with the problems which the introduction of this new force is bringing to the social order?

It was with the full realization of the duty that the electric light and power industry owes to those whom it serves, that they should be able to secure from authoritative sources accurate information on our business, that the Cooperation with Educational Institutions Committee was established. For, let it be said here, that our obligation to the public does not end with the furnishing of an ample supply of electric energy at the entrance switch to the house or factory, but we owe the public the duty of seeing to it that the information given to the youth of our land is accurate, current and in keeping with the facts.

Be it said in passing, that most of the cooperation that had hitherto existed between educational institutions on the one hand and electric light and power companies on the other had its inception in the eagerness of educators to gather from electric light and power companies the facts needed by them for proper presentation of the industry's place in the modern scheme of things.

Be it said further that in too many instances electric light and power companies are yet unmindful of their obligation, not only to those of our own time, but to those who shall follow, and are indifferent to the justice of the request of the educator and to the importance to the industry and to the public of complying with his request. I believe it to be the duty of those engaged in the electric light and power industry, when they realize that institutions of higher learning are not being adequately supplied with facts relative to our business, to take the initiative in seeing that such contacts are made as will warrant educators in believing that they can secure accurate information about the financing and operation of electric light and power companies.

Work of the Information Bureaus

Mention was made earlier in this report of the activities of the various Information Bureau organizations.

In keeping with the feeling on the part of many leaders of the industry that the public should be kept fully informed by operating companies, using for that purpose the recognized channels of information, and to set up for companies unable to maintain such equipment for themselves a vehicle through which this information could readily be conveyed, Information Bureaus were established in most of the States of the Union.

In the main, these bureaus have served a very useful purpose, and through their operation has been set up a source of information which the recognized media for the dissemination of facts have found to be authoritative and helpful. Newspapers have, in the past, come to lean on these bureaus for news that to them appeared timely relative to the progress and growth of the companies in their State. Speakers and writers have found the information furnished by these bureaus timely and accurate.

Since the establishment of the Information Bureaus, however, mergers and consolidations have eliminated many of the smaller companies, making it possible for the units so formed to maintain, as a part of their personnel, experts in the matter of assembling and distributing information relative to the operation or financing of the companies. For this reason, there has grown up in the minds of some a feeling that the usefulness of the Information Bureaus has passed, and that their functions can well, and perhaps better, be taken over by the operating companies themselves, who, after all, are charged with the responsibility of seeing to it that full and accurate information is obtainable by and given to their customers.

The question of the continuance of these Information Bureaus is food for thought, but it is felt that the solution lies with the individual companies within the States maintaining bureaus.

Gaining Public Confidence

Any business, if built on a lasting foundation, must have the confidence of those whom it essays to serve. To gain this confidence and hold it, the organization must deserve it. A business can deserve it only by adopting as a policy in the transaction of its business the old-fashioned virtues of honesty, fair dealing, straightforwardness, and a willingness at all times to give fully and freely information of any kind and character pertaining to its business.

Particularly, in the utility business is confidence the basis of any sound and lasting prosperity.

As one studies the progress of the human race and the development of society, he is convinced that no movement that has made for social progress has long lasted, unless it had as its motivating force a conscious purpose to make of the movement something beneficial to those whom it would serve.

Business is but one branch of our social order. But lasting business, like any other function of society, must have as its objective a beneficial influence on the race.

Measured by this test, our business has within it an inherent contribution to the advancement of the social order.

Through the use of electrical energy, men and women are relieved of back-breaking drudgery and hours of endless toil. Their God-given minds are free to reach out toward higher development. We are no longer content to do with manpower the hard work that can be accomplished with electricity and steam.

New Uses for Electrical Energy

Each month, in fact, almost every day, new applications are being found for electrical energy. New machines are being perfected to relieve man of still another form of labor. The American farmer, through the application of the products of American inventive genius, soon will find the drudgery, which constituted the greatest obstacle to the retention of keen business minds on the farm, a thing of the past. Already the isolation, characteristic of the farm a few years ago, is but a memory. Electricity has done all this, and we have been a part of it.

It is interesting to contrast the present day mode of life with what obtained ages ago, when human lives were held cheaper than the products of the quarry, and thousands of men were worn out in the erection of the great structures that stand as perpetual protests and reminders of the sacrifices of human energy that went into their making. Contrast our present age with the days when men were chained as slaves to the galleys, pushing vessels of war and commerce across the seas; and, even in later years, the days when not only men but women and children toiled out their lives in the mines, factories and workshops of industry. American genius, American enterprise, fostered by American individualism, aided by American business, is fast bringing us to the time when, in America, electrically driven machinery will do our every task.

Through the efforts of the men of this industry, in cooperation with manufacturers and scientists, electric power plants are taking from the earth its stored energy in the form of coal, oil and natural gas, and converting it into the most mobile form of energy—electricity—and transmitting it to the home and the factory, and, with it, performing the labor of 350,000,000 men.

Think of it, every man, woman and child in America, has at his beck and call an average of three, willing, tireless servants, never complaining, ever ready to do his bidding. Is it any wonder that America is prosperous? You men and women of the electrical world have seen your genius, your industry, your enterprise, remake a world. I say, therefore, and I say it with pride, that our industry has within itself inherently those qualities which, if honestly applied to the service of mankind, should and will insure its stability and its lasting prosperity.

Our task is made the more difficult because we are, by the very nature of our industry, a monopoly. The lengths to which men have gone to free themselves of monopolistic power have demonstrated the fact that men do not readily give up the right to pick and choose of their own free will, those upon whom they would bestow their patronage. We, therefore, have a handicap in obtaining and retaining public goodwill not encountered by those engaged in competitive businesses.

The industry has been successful in applying the laws of nature and the products of inventive genius to our problems. We have won the confidence of the leaders of the financial world. This is much, but it is not enough. Our future depends upon the degree to which we can obtain and retain the confidence of those, who, in the last analysis, are the makers or unmakers of business and government, "the folks back home."

"The Proper Study of Mankind—"

Years ago, the immortal Pope said, "The proper study of mankind is man." What a world of philosophy, what a treatise on all human relationship is bound up in this short, terse sentence.

After all, it is not enough that we conduct our business with honesty of purpose, with an unselfish desire first of all to give to our customers the full measure of service, beaten down and running over, but that our customers must know and feel within their inner-being that we are honest. In short, they must believe in us. This is my reason for saying that, in the end, public relations begin and end within our own organization.

Our business has grown up through an era of great mechanical development. The best minds of the world have been directed toward drawing from the mines of the hidden recesses of nature her jealously guarded secrets. They have patiently, by day and by night, woven these secrets into recognizable laws. Other men, through employment of their inventive genius, have made it possible, through the development of mechanical processes, to apply these laws. We have taken up the gauge at this point and are carrying it forward for the benefit of the home, the farm, and the factory.

We have been very careful in the selection of the mechanical equipment that enters into our business. We have employed every known test to determine its fitness for the job. But, have we been as careful in the selection of the human element, chosen to interpret our business and the organization we have set up, to the public? In the end, the public will think of us as they think of the men and women whom we have associated with us as the interpreters of our business to those intimate circles with whom these men and women come in contact. The question, therefore, of so-called Industrial Relations is at the very heart of our Public Relations.

The Industrial Relations Committee's Job

The Industrial Relations Committee of the Public Relations National Section has been formed for the purpose of giving to this all important phase of our business, the intensive study which we have hitherto given to the mechanical aspects of the business. No man or woman should be selected for a position in an electric light and power organization until, at least, every known test by which his fitness for the job and the determination of whether or not he possesses the qualifications to assume greater responsibility, has been applied. This is not enough. He must be so informed about the business in which he is engaged that he can properly and adequately interpret this business to his neighbors and friends, and I am of the belief that, to the extent that he goes beyond the sphere of his ordinary activity to extend opportunities for this interpretation to that extent does he merit recognition and advancement. Nor yet is this sufficient. In the mechanical field, we are won't to test from time to time the condition of the equipment employed, properly to discharge its functions. What about the human element of our business? Are we concerned about the conditions under which the men and women employed in our industry work, and do we go beyond the hours of employment and learn of the stresses and strains that may sap their mental energies and may impair their fitness for the job? In too many instances, I fear not.

When we have given at least as much attention, care, thought and study to the human element of our business as we have given and are giving to our mechanical equipment, then, and not until then, shall we have the right to expect our employees enthusiastically to help us build our organizations into, and a part of, public confidence and goodwill.

In the past year the Industrial Relations Committee has issued two serial reports. These reports are the result of special surveys made to determine what methods and means have been employed in the selection and training of electric light and power company employees, and what measures have been adopted and followed by progressive companies in safeguarding and promoting the health and happiness of employees. I commend these reports to your earnest consideration, feeling, as I do, that they are a real contribution to our business.

Recommendation by the Customer Ownership Committee Approved

The Customer Ownership Committee brings to the industry a very definite recommendation. On the theory that our responsibility to our stockholders does not end with the acceptance by them of our securities; on the theory that the good name of the industry is something of which we should be most jealous, the Customer Ownership Committee feels that there should be some sort of impartial tribunal to which men and women, who have purchased our stock and are offered in exchange therefor other securities known to us to be of doubtful value, may appeal, with a consciousness that they shall secure an unprejudiced verdict. Therefore, the Customer Ownership Committee recommends cooperation on the part of electric light and power companies with the Better Business Bureaus of the Nation. These bureaus are doing a great work. They have the facilities for impartial investigation. They should be supported. The recommendations of the Customer Ownership Committee have been approved by the Executive Committee of this section, by the National Executive Committee and by the Public Policy Committee.

Public Speaking and Employee Training

The Public Speaking Committee has had a remarkable year of achievement. More talks by employees about our business, in an unselfish effort to interpret it to the public, have been made this year than ever before. But, the important phase of this public speaking program is not the number of talks that have been made, but that "something," which once an employee has been able to give expression to the thoughts that are in him, wells up in him and makes of him a different man or woman. As a method of employee training, I commend to the electric light and power companies of the country, public speaking.

Our relations with financial institutions were never better. We enjoy the confidence of the investing public.

Women's Committee's Activities Praised

I cannot close this report without paying a tribute to the marvelous spirit that has been developed among the women of our industry through the activities of the Women's Committee, cooperating, as it has in that most estimable of all recent departures, the Home Service movement. Pointing the way, as its leaders have done, to the women of the industry to enlarge their opportunities for service, and to broaden their sphere of activity. Encouraging, as this committee has, our women to know their organization, to know its policies and its hopes, and, knowing, to interpret these policies to the women of the nation; this committee has made a lasting contribution to the industry.

We owe to Miss Malicki and her devoted staff a debt which is beyond our power to liquidate.

The women of our industry have demonstrated in many, many cases, that it is possible for the public to know us as we know ourselves to be.

It has been my good fortune during the past year and a half to come in contact with many of the leaders of our industry. I say to you in all frankness and sincerity, that I do not believe there will be found in any other line of business, on the whole, men and women more genuinely interested in the wellbeing and welfare of those whom they serve. I have found, by and large, that these men and women are recognized in the communities in which they live as leaders of thought and leaders of action. They are known to be good citizens. They are a part of, if not leaders, in every movement in their communities, making for progress and community betterment.

Past Record Assures Future Progress

Friends, these men and women, and not a few scattered individuals who may have so far forgotten themselves as to exploit the public for their own individual selfish ends, constitute the electrical industry in these United States. These energetic, honest citizens, engaged in our great business, might hurl into the teeth of their critics this query: "What, sir, have you contributed of your energy to the wellbeing of labor and industry? How have the fireside, the farm, the mine and the factory and those toiling therein been benefited by your life? We, of the electric light and power industry have hazarded our all in bringing to our citizenship opportunities for greater leisure, greater comforts, greater happiness. What have you done, except to carp and criticize, and to hinder? Are we, the honest men of the industry, to be pilloried because a few have gone the way of many other men since the dawn of society and departed from the straight and narrow way, and is not the startling record of our accomplishments in the past forty years worth something in the balance?"

The accomplishments of the past are but an index to what the accomplishments of the future may be. Our industry will continue to be a constructive force in the life of the nation only as we deserve it. It will be stable only as we are right. Being right, as I believe the industry is, as nearly as it is possible for any human agency to be right, let us not hesitate to continue to give to those for whom we are trustees of a very important service, an account of our stewardship. Let us continue to fight for what we believe to be in the best interest of the American people. Let us not stoop to pettiness. Let us not sully our great industry by deeds that will not bear the searching light of day. The record of our accomplishments reveals the contribution to society and the race too valuable to need anything but straightforwardness to insure lasting prosperity of the electrical industry.

PRESIDENT ARKWRIGHT: Mr. Owens gives evidence of the wise plan of former directors in the organizing of this Association. We always have a better president coming on.

MR. C. E. GROESBECK: Mr. President, I want to suggest that we send a cablegram to Mr. Benn, telling him that his pictures were shown to this distinguished audience of about twelve thousand people from all over the country, expressing our great appreciation of the wonderful message that he has sent to us. I think it would be a proper, right and fitting thing to do. (Applause).

PRESIDENT ARKWRIGHT: Mr. Groesbeck suggests that it would be appropriate for this audience to send a cablegram to Sir Ernest Benn of London, expressing our appreciation to him for the wonderful message he gave to us. We can't do it in person to him, although it seemed that he was here in person. I think it is a most appropriate suggestion.

If you favor it, will you please say "aye."

[The motion was adopted.]

In connection with the talking motion picture, it is the purpose, as Mr. Clapp explained, to have a talking motion record made of this convention to be sent to the various geographic divisions. It is a very useful, graphic means of presenting matters and subjects. Those of you who are interested might find it profitable to visit the exhibit of the Electrical Research Products, a subsidiary of the Western Electric Co., and a member of this Association, which is featuring a display of commercial talking pictures in the exhibition hall.

The next number on the program brings to us a gentleman who is not new to the electric light and power industry, a lawyer, and associated with the Pittsburgh companies, over a long period of years, previously president of the Philadelphia Co., merely changed from one capacity to another. He is now the Chairman of the Board of the Westinghouse Electric & Mfg. Co. In that particular capacity this is his first general public appearance. He will talk to us this morning on the subject of the "Customer's Side of the Meter," and it is a great pleasure to present to you Mr. A. W. Robertson, Chairman of the Board of the Westinghouse Electric & Mfg. Co. Mr. Robertson. (Applause).

THE CUSTOMER'S SIDE OF THE METER

By A. W. ROBERTSON

Chairman of the Board of the Westinghouse Electric & Manufacturing Company.

As is often the case, this brain-child of mine had to be named before it had seen the light of the day, and after I saw it I realized that instead of calling it "William Ganson," I should have called it "Bill," because it is altogether too simple a story to have this broad title ("The Customer's Side of the Meter"); in fact, a sub-heading of this nature, "The chain from the power plant to the customer's service is no stronger than the weakest link," would be more appropriate. When we know what a marvelous change takes place in the electrical product, as it moves from the power plant to hot coffee in the customer's house, I think we realize that that chain is a long one and has many links.

Far back in the dim past it was probably true the meters between the public utility company and the consumer formed a Chinese wall that separated one from the other, but that wall has long since been broken down and now the customer's service receives the best thought of the industry and that thought is not entirely prompted by reason of the fact the customer's side of the meter shows the number of kilowatt-hours consumed from which we figure the bill.

It would not, however, be wise to discuss the consumer's side of the meter, if the public utility's side had not already received thorough attention.

The other day I attended the ceremonies at the Hell Gate Station of the United Electric Light and Power Company in New York, celebrating the placing in service of two giant 160,000-kw. turbines—the largest and most economical in the world. Each of these enormous machines is capable of furnishing electric current to light a million homes. Today, all over the United States, machines very similar to these are generating electric current at a cost which, years ago, would have made Thomas Edison and George Westinghouse exclaim in unbelieving surprise.

We know that before the enormous quantity of electric current being generated in America reaches the homes it serves it must be transmitted over thousands and thousands of miles of wire, it has to pass through transformers to curb and tame it for domestic use, and its path must needs be protected by expensive switches and automatic circuit-breakers to guard it from its cousin—the lightning of the skies—and from its own inherent tendency to break through all restraint and vanish into universal energy.

The Magic of Electricity

The magical development of the art of producing electric current is a story with which we are all familiar, as it happened within the lifetime of most of us. Sometimes I think our very familiarity with this story destroys for us the glory and majesty with which it is surrounded. No other conquest of the forces of nature can compare with it. Here we have an energy which is beyond the reach of our senses—which we can neither see nor hear nor touch—which is created in such a powerful form that it is death for us to ascertain its characteristics directly—and yet we cause it to fly along the wires with the speed of light—seven times around the world in the wink of an eye—and we deliver it to all points on the system—gentle, harmless, and ready to serve our customers as they may desire.

Into the producing of this electric current, billions of dollars of investors' money have gone for building power plants, transmission lines, cables, substations, and all the rest that goes to make up the great generating and distributing facilities of the industry; more billions have been spent to reduce the cost of electric current, with the result that it is today recognized as being one of the cheapest commodities in America; while still more billions have been utilized in making electric power service a synonym for reliability.

Reliability Wins Confidence

This thought of reliability brings to my mind the fact that, during the past year, it has been the custom of some agencies to attempt to discredit the light and power industry in every possible way; but, without complete confidence in the power companies, would investors universally depend upon them for the power needed to make productive their investments in factories, hotels, theaters, halls, apartment houses and homes? In the old days, every factory had its own power plant, for no one would depend upon a disinterested third party for the power which alone could make a factory operative; but today, every modern factory buys its power from a public utility company, no one thinks this reckless or imprudent, because everyone respects the good faith and the integrity of the power companies, and the maligners of the industry have yet to find one single customer who can show that the power companies have ever been untrue to the confidence placed in them.

This, I claim, is one of the proudest records to which any organization can point, and it explains why the nefarious propaganda of a few people has been unable to disturb the prosperity and steady growth of the power companies. As long as they continue to deserve this confidence, so long will the slanderous tongue of the envious be harmless to them. It is no wonder, therefore, with this proud record back of us, that so much attention has been given to the producing side of the meter.

The Customer's Side

But, we must not forget the other side. The customer's side is vastly different from the company's side. On the company's side are kilowatt-hours, amperes and watts, circuit-breakers, turbines, condensers and countless other things. On the customer's side, there is not even electric current, as the producer thinks of it; no kilowatts, no amperes, no watts.

What the customer buys is, first of all, light—not electric current, but light. Then he buys heat; or, rather, hot fragrant coffee, crisp bacon, hot toast and waffles, and all the magical things that come out of the chafing dish and off of the electric range. Finally, he buys some form of action, such as is manifested by the vacuum cleaner, the washing machine, the ironer, the electric fan, and many other devices—but none of these things purchased by the consumer have the remotest connection in his mind with kilowatt-hours, or watts.

Customer's Interpretation Important

All this is very simple and is very well known to all of you, and I fancy that some of you are saying:—"Well, what of it? We know very well what the consumer does with electric current!" But the importance of it lies in this fact:—if the consumer is primarily interested in buying hot coffee, rather than kilowatt-hours, from the great power company that serves him, then that great power company must interest itself in furnishing that coffee; provided, of course, the customer cooperates to the extent of providing a few coffee beans and a little water to help out the transaction.

Someone started the legend in China that people pay the doctors to keep them well. I can imagine some time in the future that consumers of a public utility company will pay it for keeping their appliances well. In other words, the public utility company will furnish a service over and above what it furnishes in the way of electric power, namely, the servicing of the appliances which the consumer has, keeping the cords in shape, and so on, so that every appliance is ready to do its appointed task, but whether the problem be solved in this way, or some other, it is undoubtedly the path of wisdom for all of us to serve to the end that the customer may be served in the manner which pleases him, and there is something about the idea of the power company being interested in furnishing hot coffee that pleases all of us as individuals. I, myself, when I drive up to the Standard Oil service station get a real thrill when the Standard Oil Co. wipes off my windshield. I think we are all alike in that respect.

Service in Terms of Things Wanted

How are we meeting this problem of furnishing the customer not with electric current, but with the services which flow from the proper use of electric current? One thing is certain—the response of the customer in the use of electric current will be exactly commensurate with the service he receives expressed in terms of the things he wants. In other words, if the electric iron works perfectly, the housewife uses it frequently and buys another as soon as it wears out—if a modern iron ever does wear out. If the vacuum cleaner is reliable, it is constantly in service and is replaced by a new one as soon as it is done for—and so on.

But if the iron is unsatisfactory, due to some fault in the iron, or the circuit, or what-not, it goes onto the shelf and the housekeeper sticks to the good old-fashioned things she was brought up with. So it would appear to be the better part of wisdom to see that the facilities which enable consumers to receive in their homes those comforts and conveniences which they want are maintained in a high state of efficiency. Their reliability must be unquestioned—they must be economical—they must be convenient—they must be serviceable—and they must, of course, be fool-proof, so that they may be used frequently without any danger whatever.

Who Is Responsible to the Consumer?

We have already reached a high degree of perfection in meeting this standard, but it is a field where there is much yet to be done. Neither the power companies nor a few manufacturers control the situation. The facilities used in the average home are produced by more than 1000 manufacturers and are for sale in more or less variety in at least 25,000 electrical, department, hardware, and other stores. The power company might well say that if it controlled the appliances the consumer fastens to the sockets, it could then be sure that the service would be exactly what the most exacting critic would require; but inasmuch as the consumer is free to buy his appliances from anyone, the power company is absolved from all responsibility. There is nothing to prevent the power company from taking this attitude, but that will in no sense relieve it from the criticism the consumer is going to make when he fails to get the hot coffee which he conceives he is buying from the power company. In other words, the power companies and the electrical industry as a whole are going to be blamed for the failure of any member of the industry, whether he is a maker of switches, coffee percolators, Christmas tree devices, or what-not, all of these simple things contribute to making electric service good or bad, as far as the consumer is concerned; and if it is bad, he is dissatisfied and lends a willing ear to the gossip of the faultfinder.

As I said in the beginning, much has already been done along this line, but I believe we can do very much more if we will look upon our merchandising facilities, not only as money-making departments to be run on a sound economic basis, but also as places where the right type and kind of appliances at different price levels are on display for the information of the customers of the power company.

We should stimulate architects and builders to put into new homes and apartments only standard, high-grade appliances. Encourage in every way possible the use of right appliances as against unreliable devices, which, if they should fail, bring down upon the heads of manufacturer, public utility, and all of us, criticism which is difficult to answer. (Applause).

PRESIDENT ARKWRIGHT: We thank you very much Mr. Robertson.

The next item on the program is a report of the Constitution and By-Laws. Mr. R. F. Pack, Chairman, former president of the National Electric Light Association. Mr. Pack.

REPORT OF CONSTITUTION AND BY-LAWS COMMITTEE

BY R. F. PACK, *Chairman*

(For Committee Personnel, See Appendix 4)

The Constitution and By-laws Committee has suggestions to make of revisions to the Constitution. These recommendations have already been approved by the Executive Committee. The purpose of these changes is to adjust the dues of Class "F" and Class "H" member companies, so that these members may pay more nearly the cost of servicing them. Section 6 of the Constitution provides the dues to be paid by company members under Class "F." These dues are on a sliding scale, and it is probably unnecessary to read them to you now. It is proposed to amend Section 6 of Article IV to read as follows:

> "SECTION 6. The annual dues of Associate Company Members (Class 'F') shall be based on the gross sales from the sale of electrical apparatus, equipment, appliances, publications or service by the company, firm or individual during the preceding calendar year. The rate of dues for Class 'F' members shall be one one-hundredth of one per cent (1/100 of 1%) of such gross sales for such period. The minimum dues of any Class F member shall be Twenty-Five Dollars ($25) per annum, which minimum dues apply only when the gross sales during the preceding calendar year were not greater than Two Hundred and Fifty Thousand Dollars ($250,000)."

It is proposed also to amend slightly Section 7 of Article III. This provides the designation of Class "F" members, and among other companies it refers to electrical jobbers. Inasmuch as electrical jobbers are now more generally known as "electrical wholesalers," it is proposed that Section 7 shall read as follows:

> "SECTION 7. Class 'F' members shall be companies or firms of electrical wholesalers, contractors, dealers, electrical or mechanical engineers, publishers and associations—corporations or individuals—who are interested in advancing the use of electrical energy, and are not engaged in its production or distribution. They shall have the same privileges as Class 'D' members, except the right to vote at executive sessions."

Finally, it is proposed that Section 8 of Article IV now reading as follows:

> "SECTION 8. The annual dues of Foreign Company Members (Class 'H') shall be Twenty Dollars ($20)."

shall be revised to read as follows:

> "SECTION 8. The annual dues of Foreign Company Members (Class 'H') shall be Fifty Dollars ($50)."

Mr. President, I understand that under the Constitution it is necessary to appoint a Constitutional Revision Committee which will report later on the suggestions of the Constitution and By-Laws Committee.

PRESIDENT ARKWRIGHT: You have heard the report of the Committee on Constitution and By-Laws. The Constitution requires that this report before being acted upon must be referred to a committee elected by the Association and resubmitted on their report, and requires a two-thirds vote of Class "A" and "B" members present to adopt it.

It has been customary to appoint as the Constitutional Revision Committee the same personnel which compose the Constitution and By-Laws Committee. That personnel consists of Mr. Pack and the President and four Vice-Presidents of the Association.

MR. H. M. EDWARDS (New York Edison Co., New York): Mr. President, I move the adoption of the suggestion that the personnel of the Constitutional Revision Committee be the same as the personnel of the Constitution and By-Laws Committee.

The motion was seconded by Mr. L. B. Herrington (Kentucky Utilities Co., Louisville, Ky.).

PRESIDENT ARKWRIGHT: The motion has been made and seconded. Is there any discussion? If not, I will put the motion.

[The motion was put to a vote and carried.]

PRESIDENT ARKWRIGHT: The next item on the program is the eelction of a nominating committee to present nominees for the various offices of the Association for the ensuing year.

MR. SIDNEY Z. MITCHELL (Electric Bond & Share Co., New York): Mr. President, I nominate Mr. W. W. Freeman.

[Mr. William H. Taylor (The Philadelphia Electric Co., Philadelphia, Pa.) seconded the nomination.]

[MR. CHARLES L. EDGAR (Edison Electric Illuminating Co. of Boston): Mr. President, I nominate Mr. R. J. Graf.]

[Mr. W. Paxton Little (The Niagara Falls Power Co., Niagara Falls, N. Y.) seconded the nomination.]

MR. THOMAS N. MCCARTER (Public Service Electric & Gas Co., Newark, N. J.): Mr. President, I nominate Mr. Franklin T. Griffith.

[Mr. Louis H. Egan (Union Electric Light & Power Co., St. Louis, Mo.) seconded the nomination.]

MR. HERBERT A. WAGNER (Consolidated Gas, Electric Light & Power Co. of Baltimore, Md.): Mr. President, I nominate Mr. C. E. Groesbeck.

[Mr. F. R. Phillips (The Duquesne Light Co., Pittsburgh, Pa.) seconded the nomination.]

MR. GUY W. TALBOT (Pacific Power & Light Co., Portland, Ore.): Mr. President, I nominate Mr. Martin J. Insull.

[Mr. D. C. Barnes (Stone & Webster, Inc., Boston, Mass.) seconded the nomination.]

PRESIDENT ARKWRIGHT: Are there any other nominations?

MR. R. F. PACK (Northern States Power Co., Minneapolis, Minn.): Mr. President, I move that the nominations be closed.

The motion was seconded by Mr. J. E. Davidson (Nebraska Power Co., Omaha, Neb.)

PRESIDENT ARKWRIGHT: Those in favor of the motion made that the nominations be closed please say "aye." Opposed, "no."

[The motion was adopted and nominations closed.]

PRESIDENT ARKWRIGHT: If you vote to elect the gentlemen named, W. W. Freeman, R. J. Graf, Franklin T. Griffith, C. E. Groesbeck, Martin J. Insull, as a nominating committee, please say "aye." Those opposed, "No."

The "ayes" have it, and the motion is unanimously adopted and they are elected.

Before adjournment I should like to call attention to the fact that two of the national sections of the Association have their meetings this afternoon. The Accounting Section at the Hotel Chelsea at 3 o'clock; the Engineering Section in this hall at 2:45 o'clock. There will be no general sessions, that is, if you call these general sessions and those not, but they are very instructive and educatioanl and desirable to attend, and the reason why the so-called "genearl" session is not continued into the afternoon is that we may have an opportunity to attend these various section meetings. I hope very much you will do so.

The next general session will be held in this hall tomorrow morning at 10 o'clock. We hope to start it as today, promptly at 10.

In addition to the other features of interest, variety will be added to the meeting, for you will have a different presiding officer. (Laughter.)

I wish to thank you for your prompt attendance, your kind attention, for your responsiveness to the speakers, and remind you that it began on time, moved promptly and ends early, as I hope they all will. The meeting is adjourned. (Applause.)

[The meeting adjourned at 12:40 p. m.]

SECOND GENERAL SESSION

WEDNESDAY, JUNE 5, 1929

[The meeting convened at 10:05 a. m., President Arkwright presiding.]

PRESIDENT ARKWRIGHT: The convention will please come to order.

Mr. Matthew S. Sloan, Vice-President of the National Electric Light Associatoin, will preside over the first half of the morning session. Mr. Sloan!

[Mr. Sloan took the Chair.]

CHAIRMAN SLOAN: The first order of business on the morning program is the announcement of the Memorials Committee. The President asked me to say that he has appointed Mr. W. H. Onken, Jr., Chairman of the Memorial Committee.

We will now have the report of the Exhibition Committee, presented by Mr. E. W. Goldschmidt, Wagner Electric Corporation, New York. (Applause.)

REPORT OF EXHIBITION COMMITTEE

BY E. W. GOLDSCHMIDT, *Chairman*

(For Committee Personel, see Appendix 4)

Our constitution declares the object of the Association to be "to advance the art and science of the production, distribution and use of electrical energy of light and power for public service," and that in furtherance of this object its activities should be largely educational and for the fullest development of the electrical engineering arts and sciences in all its branches.

I don't want to make any extravagant statements, but I submit that the exhibition in the adjoining hall conforms to the object as stated and meets the specifications as to educational value.

The Association membership includes every branch of the industry. Every firm or individual, active or only interested in advancing the use of electrical energy, is welcome to apply for membership.

The practical application of electricity to the service of humanity actually began with Mr. Edison's invention of the incandescent lamp and the means to use it effectively through a system of electrical distribution. This event we now celebrate on its fiftieth anniversary. In all cities electrical service has become a commonplace, but a vital necessity to our standard of living. The service is now being rapidly extended even to our farms. Further expansion is inevitable and apparently without limit.

All Classes of Membership Cooperate

It is only through the real cooperation of all the classes of membership in our Association that the marvelous achievements in applied electricity have been realized in this country. The spirit of cooperation prevailing among Central Stations, which are naturally non-competitive in their territories, has been passed on to the manufacturers and developed a parallel spirit of cooperation, although they are in keenest competition with each other for public favor. It is most gratifying to note that there is now no longer any evidence of a dividing line in activities between the class memberships of the Association. All are cooperating—working together for the advancement of the common purpose.

Prior to 1908 exhibitions at conventions were dependent entirely upon the initiative of individual manufacturers. The exhibitions were unorganized and haphazard. The invitation circular to the twelfth convention at Cape May in 1890, as printed in the recent May N. E. L. A. *Bulletin,* stated: "Although there will be no exhibition under the auspices of the Association, you can secure a sample room and display your samples in your own way to the hundreds of users of such supplies who will be at this convention." Some contrast!

In 1908 the Executive Committee authorized the manufacturer members to organize a committee from their own members for the purpose of conducting exhibitions at the conventions of the Association. The exhibitions were, for a number of years, held biennially (with some interruptions, such as the war years), but for the last four years have been annual convention events. They have grown quite steadily and consistently, in extent, educational value and participation. In 1908, 41 exhibitors took 3650 net square feet, an average of 89 square feet per exhibitor. In this 1929 exhibition we have 226 exhibitors taking 97,926 net square feet, an average of 433 square feet per exhibitor. The Class D (Manufacturers) membership has grown to 415. Some 200 or 300 more manufacturers whose activities should interest them in membership in N. E. L. A. were given the opportunity of becoming members. Participation privileges at the exhibitions have always proven strong incentives to manufacturers, influencing them toward membership in the Association. At least twenty-five additional firms this year indicated desire to join the N. E. L. A. provided they could secure space in this exhibition. Unfortunately, their interest was not manifested until all available space had been assigned and it had become impossible to accommodate them.

The 1929 Exhibition

Is today's exhibition not a remarkable accomplishment and a direct expression manifesting the manufacturer's unity of purpose to advance the entire industry and not only their own individual interests? No such exhibition as we have here today would be possible without their complete cooperation to this end. It is truly a great exhibition because it has, first, the most magnificent setting imaginable, one of grandeur and extent not available elsewhere in the world; second, because of the outstanding character of the exhibiting manufacturers who have cooperated to make this exhibition; third, because of the quality and variety of the products displayed and the individuality, originality and attractiveness of the individual settings provided by the respective exhibitors to match the standard of magnificence of the exhibition hall; fourth, because of the character of the manufacturing company representatives personally in attendance at this particular convention and exhibition. The result is this finest illustration of what may be accomplished by competitive cooperation on a large scale.

Spirit of Fairness and Cooperation Prevails

I have been honored with the Chairmanship of the Exhibition Committee for three conventions and have, therefore, been privileged to observe the spirit and attitude with which our manufacturing members responded to the Exhibition Committee's invitation to them to cooperate in making the exhibition a success. I am, therefore, well qualified to testify as to this particular spirit. It was participation in its actual work that completely convinced me of the Committee's spirit of utmost fairness to every member regardless of size or influence, and complete equality of members in participation in any and all privileges accorded the Class D members. This conviction is the reverse of a misapprehension which I felt when first elected to membership on the Committee. I believe this impartial treatment is largely responsible for the cooperative spirit which prevails.

I want to take this opportunity to express on behalf of the Committee appreciation for the splendid support that we have had during our work from President Arkwright, not only this year, but during the years of his vice-presidency. His enthusiasm, his stimulating expressions at every opportunity have been a great help to the Committee in spurring them on and making greater effort to have the exhibition a success.

I want also to make acknowledgment publicly here of the very great help that the manager of this auditorium, Mr. Lincoln Dickey, has been to us in making and completing the arrangements, enabling us to install the exhibits here without any disorder or any confusion whatsoever. The expressions we have had from our exhibiting members have all been extremely complimentary. Thank you very much. (Applause.)

CHAIRMAN SLOAN: The next order of business is the report of the Engineering National Section Committee. This report will be presented by Chairman E. C. Stone, of the Duquesne Light and Power Company, Pittsburgh.

REPORT ON ENGINEERING NATIONAL SECTION

BY E. C. STONE, *Chairman*

An outline of the activities and findings of the committees of the Engineering National Section was presented in my report to the Section at its session yesterday afternoon. The report embraced more detail than would be of interest to this general session. At this time I wish to call your attention only to one or two of the matters covered, as follows:

All of the committees of the Engineering National Section have been in active operation during the past season, and have functioned with their usual effectiveness. The objective of "more System Capacity per Dollar of Investment" has been definitely reflected in their work, as is shown in the marked attention given to the development of designs and methods which will make for greater economies.

Interest in Work Increases

The increasing interest in this work is shown by comparative analysis of the organization personnel for the administrative years 1927-28 and 1928-29. The number of member organizations participating in the work of the Engineering National Section increased from 201 to 221, or 10 per cent, and the number of individual engineers having membership on the various committees increased from 550 to 630, or 14½ per cent.

"More System Capacity per Dollar of Investment" is emphasized because of the increasingly important part that fixed charges are playing in the total cost of electric power service. With fuel efficiency at its present high level, the cost of generation has become almost a minor item, so that system investment now offers the greatest field of opportunity for further major economies. In the past, attention has been centered on reducing fuel and other operating costs. In the future it will be devoted particularly to economical system design and control of construction costs.

The two new committees, Power Systems Engineering and Special Engineering Research, which were organized last fall, have given a good account of themselves in the first year of their existence. The Power Systems Engineering Committee provides for study of the now very important subjects of system planning and design, and rounds out the organization to meet present-day conditions. This Committee has found a very definite, well-crystallized and uniform opinion among those executives who have developed planning organizations in their own companies that comprehensive future planning will bring about important savings in overall investment and operating costs, and therefore offers the definite recommendation that a planning department should be set up in every growing electric power utility.

Engineering Research Studied

The Special Engineering Research Committee, after making a comprehensive survey of the status of engineering research in the power industry, finds that there exists considerable duplication of effort which is wasteful of time and money, although entirely unavoidable under the circumstances, and concludes that proper coordination of research work in the industry can be best obtained by setting up a paid secretary at Headquarters. The duties of such a secretary, who would naturally be placed in the Headquarters Engineering Staff, should be to maintain a complete file on research projects of interest, to arrange for adequate publishing of information regarding results as rapidly as they can be made available, to arrange for the initiation, placing and financing of new and desirable research projects, and in general to do all that a staff man can do to coordinate and guide research work so that it will be of maximum use to member companies.

The Executive Committee of the Engineering National Section has approved this recommendation, and it is earnestly hoped that appropriate provision for carrying it out will be made in next year's budget of the Association. The situation in respect to engineering research in the power industry is such as to make the adoption of this recommendation of primary importance.

An important step in standardization was made possible when the Executive Committee of the Engineering National Section approved the report of the Joint Committee of the N. E. M. A. and N. E. L. A. on preferred voltage ratings for alternating current systems and equipment. The adoption of the recommendations of this report generally by member companies will simplify the manufacturers' lines of apparatus, will bring about better adaptation of equipment to its service under prevailing conditions and will generally improve conditions for the interconnection of adjacent power systems. While the recommendations cannot be uniformly adopted at once, it is to be hoped that member companies will direct their system development toward the complete acceptance of the preferred voltage recommendations as soon as practicable.

The Year's Developments

Engineering developments during the past year have been along the line of better understanding of the problems of design and operation, and further refinements in equipment. The major radical development of importance was in the field of circuit interruption, where material advance has been made in the design of high duty circuit breakers not requiring oil. The so-called "Deion" circuit breaker has been successfully tested on a large power system.

Two major problems of power system engineering, system stability and lightning protection, have received much attention during the past year. Increasing interest in these subjects is logical, in view of the constantly increasing importance and volume of the power companies' business. Marked advances have been made toward satisfactory solutions of both of these problems.

Considerable public attention has recently been directed toward electrical hazards in the home. This is probably because, while such accidents are very few, they are necessarily spectacular in nature when they do occur. Recent statistics of the National Safety Council, indicate that the chance of a fatal accident in the home from a fall is sixteen times that from electricity. Nevertheless, the Accident Prevention Committee has sensed the need for some sane recognition of this situation and prepared, with the cooperation and approval of the Commercial National Section and other interested parts of the Association, a safety in the home pamphlet under the title of "Common Sense." This pamphlet will be available shortly.

Resuscitation Booklet Builds Good Will

The booklet on "Resuscitation" prepared last year jointly with other interested organizations, has had a circulation unprecedented for N. E. L. A. publications. Including reprints issued by insurance and manufacturing concerns this circulation has reached into the millions. The work of the industry in educating the public in methods of resuscitation is having a very beneficial effect in building public good will.

In recognition of the probable engineering requirements in connection with the intensive load building effort that will be put forth in the next few years, the Utilization Subcommittee was created this year in the Electrical Apparatus Committee to deal with the problems involved in the utilization of electrical energy including the engineering of present applications and the development of new uses. During the past years the Headquarters Staff has cooperated with the Commercial National Section in dealing with problems of wiring, oil burners and water heating.

Headquarters Engineering Staff

The Headquarters Engineering Staff, under the able direction of Major Bennion, is now very effectively organized, and although undoubtedly undermanned, has given an excellent account of itself during the past year. The engineers of the Staff are at the same time the sentinels and ambassadors of the industry in engineering matters. On the one hand they keep in close contact with the activities of many other organizations whose work may affect our interests and promptly bring to the attention of the proper parties all matters on which action may be required. On the other hand, they constitute an official point of contact with outside organizations and provide a channel for effective cooperation in engineering matters. Thus they not only protect the engineering interests of the power industry, but also make possible the cooperation of our industry with others in such a way as to bring about coordinated physical development and general good will. The engineers of Headquarters Staff are doing well a very important work, particularly in the code situation and on the problems of coordinated construction with other utilities. They should receive generous support and be permitted to expand their organization as the growing industry they represent throws additional burdens upon them. For example, last winter, in accordance with the recommendation of President Arkwright, company code representatives were designated by many member companies to serve as channels for information to and from Headquarters direct to member companies. The arrangement throws an additional heavy task on Headquarters Staff to maintain this contact, but the records which are being built up as a result of this plan and the solidarity which results from the closer contact is going a long way toward solving the code problem which has been confronting the industry in recent years.

Committees of Geographic Divisions Progressive

The engineering committees of the Geographic Divisions have made further progress during the past year in finding themselves, and their activities have been more extensive and more effective than heretofore. With the more definite understanding of their purpose and scope, the geographic organizations are being molded to specifically meet the local conditions. While the national organization is being used as a guide, each division is setting up only those committees in which it has a direct interest, while in some instances special committees have been organized to meet special conditions. This is as it should be. Such encouragement and advice as appeared useful has been given by the officers of the National Section to the geographic organizations. The chief recommendation has been maximum simplicity of organization to meet clearly defined local requirements. In the working out of geographic engineering activities, a definite trend has been noted toward the conference form of activity. That is, the various engineering committees of the respective divisions have met together once or twice a year for general conference and exchange of ideas. Definite programs have been prepared in advance with carefully selected and well-qualified speakers to cover the subjects set up for discussion. These programs have been advertised in advance. The result has been most gratifying, and indications are that this method of carrying on divisional work will be generally adopted. Very favorable comment must also be made of the valuable serial reports on timely engineering subjects which have been prepared by a number of the divisions. These reports form an important part of the work, but, after all, must be considered secondary to the major purpose of bringing together the engineers of the various companies for interchange of ideas and discussion of mutual problems.

Movement for Standardization

One of the objectives of the Engineering National Section is constructive cooperation in the national movement for standardization. It seems evident that standardization affecting the power industry up to the present time has been generally advantageous, and has resulted both in economy of power production and in extension of power uses. There may, however, be a possibility in our present enthusiasm for standardization of allowing the pendulum to overswing. The kind of standardization which established frequencies, utilization voltages, ratings of the equipment, factors of safety of equipment, has been a major factor in developing the use of electricity in this country. In the field of simplification, however, which results in a reduction in the capacities of equipment or qualities of material available, the immediate result is a less close adaptation of the available products to the service for which they are to be used. This fact alone means some economic loss. On the other hand, the results of simplification bring about economies, such as reduced costs of manufacture, reduction in stocks to be carried, and so on. It is thus necessary to balance the advantages and disadvantages of a given standardization project of this kind in order to determine its true economic value.

The major purposes of standardization, to effect economies and extend use of product, must be kept in mind in setting up the standardization program. It is suggested that the Engineering National Section during the coming year should give study to the subject of standardization, with a view to determining the lines along which standardization may be promoted to best advantage and wherein over-standardization with economic loss is a possibility.

Keep Informed Through Serial Reports

A report on the work of the Engineering National Section would not be adequate if it did not call attention to the very valuable serial reports which are published from time to time by the various committees of the Section. These reports together constitute a complete, up-to-the-minute exposition of the latest and best engineering practices and methods of the electric power industry throughout the country, and are authoritative because they are compiled by the members of the engineering committees, who in turn are the engineers actually responsible in their own companies for the work covered by the reports. It is earnestly recommended that all member companies place standing orders with Headquarters for new reports of the various committees as they are issued, in order that their engineers may keep fully informed on the engineering developments in the industry.

CHAIRMAN SLOAN: The next order of business is an address by Mr. Britton I. Budd, President of the Public Service Company of Northern Illinois, Chicago, Ill., on the Electrification of Railroads.

ELECTRIFICATION OF RAILROADS

By BRITTON I. BUDD, *President,*

Public Service Company of Northern Illinois, Chicago, Ill.

The history of steam railroad electrification commenced in 1895 when two short sections were electrified in the United States. Since then electric power has to greater or lesser extent been adopted by the railroads in 29 different countries in all of the six continents and some of the principal islands. About 10,000 miles of line are now electrified out of a total of 600,000 miles in these countries. The electrified mileage thus constitutes about one and two-thirds per cent of the total route miles in the countries involved.

Switzerland has the highest percentage of line electrified, namely 43½ per cent. Morocco has nearly 18 per cent electrified, Austria nearly 11 per cent, Italy and Sweden slightly more than 7 per cent, Chile 4½ per cent, England and France about 2½ per cent, and the United States only ¾ of 1 per cent.

Viewed from the standpoint of actual miles electrified, at the end of 1928, the United States has 1900* miles of line electrified, Switzerland 1500 miles, Italy slightly more than 1000 miles, Germany nearly 1000 miles, France and Sweden each more than 700 miles, England and Austria each between 400 and 500 miles. Other nations with 200 miles or more electrified are: Chile, Brazil, Australia and the Union of South Africa.

Status of Electrification in the United States

With special reference to the United States, there are 20 railroads having some electric operation. The length of route electrified is 1900 miles, of all main track 3100 miles, and of all tracks, including yard and side tracks, 4300 miles.

In the past year the Boston, Revere Beach and Lynn Railroad has been completely changed to electric operation. The Great Northern and the Pennsylvania have added considerable mileage to their previous electrifications and several new projects have been announced.

The three large electrifications now under way are on the Pennsylvania, the Reading, and the Lackawanna. The Pennsylvania's undertaking is impressive, and for magnitude of traffic is the largest undertaking ever turned over to electric motive power. Briefly, it consists in complete electrification of freight and passenger traffic on 325 miles of line and 1300 miles of track. It will extend from New York and Philadelphia to the Susquehanna Valley and involve the capital investment of $100,000,000.

The two other large projects are the Philadelphia suburban service of the Reading Company with 50 miles of line and the suburban service of the Lackawanna in New Jersey opposite to New York City. The latter comprises 78 miles of line. The three big undertakings together will add 450 miles of line and 1580 miles of track to that already electrified in this country. Although all arrangements have not yet been announced, it is expected that a large amount of the electric energy will be furnished by the power companies in the territories involved.

A number of other railroads are making studies with a view to electric operation. In the past 25 years, I think it safe to say that there has not been a year in which several important sections of our railroads have not been investigated with regard to the adaptability of electric power and its relative cost. Some of them have been studied and restudied in the aspect of changing conditions and new inventions. This process will probably go on indefinitely and we of the electrical industry should be prepared to cooperate with the railroads whenever the opportunity offers.

Railroad Requirements Must Be Studied

We can do a great deal to familiarize ourselves with the technicalities of railway power supply which is quite unlike most of our other power business. It is not sufficient merely to have power stations and transmission lines available. We must know something about the practical operation of railroads and must be prepared to offer them the kind of service that they need with contracts suited to that particular business.

We must clearly remember that the railroads are in the transportation business and use motive power only as a means to that end.

I would recommend to power companies generally, if they are so located as to now or in the future supply power to steam railroads, that one or more members of their staff be thoroughly familiar with railroad operation and the problems which a railroad has to meet in connection with its motive power. In the case of every other industry where electricity has been used, the power companies have had trained men, experienced in the manufacturing processes, as well as in the power business, and this kind of talent was responsible for the introduction of electric energy for a great variety of uses in industry; but, without the aid of men possessed of this training and knowledge, little progress would have been made. Many power companies have had experience in furnishing electric energy to street-railway and interurban systems, but the problem of furnishing power to steam railroads is entirely dissimilar, and a comprehensive knowledge of railroad requirements must be obtained if that problem is to be handled with the same intelligence and understanding as in other fields of power application.

For several years I have had the honor of directing the activities of this Association's Committee on Electrification of Steam Railroads. We are following the subject along the broadest possible lines in its ramifications all over the world. We are publishing every year general statistics on railroad electrification that are the most complete in existence.

---

*EDITOR'S NOTE: The figures in Mr. Budd's paper for lengths of line electrified and in process of electrification are larger than the corresponding figures in Mr. Gibbs' paper which follows. This is due in the first case to inclusion of some small railroads not included by Mr. Gibs, and in the second case due to inclusion of the whole program of electrification of the Pennsylvania Railroad extending over eight years, while Mr. Gibbs has included only that part being worked upon at present.

I hope that the publications of the Electrification Committee are having as much circulation and study in the electric-power industry as they are having in the railway industry. They represent a vast amount of work and study and the painstaking effort of experts for the instruction of everyone interested in the subject.

This year a Subcommittee, consisting of engineers representing railroad and power companies, was sent to Europe to study the development of electrification. They spent two months traveling through England, the Netherlands, Sweden, Germany, Switzerland, Italy and France. They were very well received and every opportunity was given to afford a good understanding of what was being done there.

And here I want to acknowledge the gratitude of this Subcommittee to many prominent executives in our industry in this country for the letters of introduction which opened the doors not only of the various managements connected with the operation of electrified railroads in Europe, but of all the great industrial concerns who might be interested and helpful in showing our Subcommittee around.

Railroad Electrification in Europe

The interest of European railway engineers in this subject is very intense, probably more so than in this country for some special reasons which I shall try to make clear to you later. Many of the railway men interviewed on the Continent had been in this country to study our electrifications. Many of them are coming back again and are planning to send numbers of their younger associates to see the electrifications in the United States. When these engineers visit our country, I hope every courtesy will be extended to them by the members of the National Electric Light Association and that they will be given the opportunity of seeing what we are doing here.

The European railway engineers are particularly interested in our railroads on account of the heavy tonnage per train, both freight and passenger, operated in the United States. In general, their roadway and structures and cars are lighter than ours, the drawbars and couplers of much lower capacity, and the use of air or vacuum brakes is limited largely to passenger equipment. In Europe freight trains of 300 to 500 tons are the limit on many roads. Two thousand tons is the maximum under any circumstances. Six hundred tons is the limit for passenger trains. In this country, as you know, freight trains of 6000 to 12,000 tons are in daily service. Our passenger train loads run between 1000 and 1200 tons maximum.

I mention the difference here, not in any disparaging way, as they operate under very different conditions, but simply to indicate that we cannot follow their designs and methods in all respects.

On the other hand they have had considerable experience with electrification. They have great ingenuity and inventive capacity and have developed some very fine mechanical and electrical equipment for their railroads.

In Europe where electrification has taken place on the railroads there has been some special or compelling reason for the change from steam to electricity. There are several nations that do not have domestic coal resources, like Sweden, Switzerland and Italy. All these countries are well supplied with water power. This has led them to make extensive use of electricity on the railroads as a national policy to develop their own resources and become independent of foreign fuel supplies while at the same time improving their balances in international trade.

In each of the three countries mentioned, electrification has been introduced first on the most difficult lines to operate, those having heavy grades and tunnels. The other criterion is unit coal consumption, or tons per year per mile of route. Where adopted as a fuel saving method, the greatest saving in proportion to the investment can be made on the lines of heaviest fuel consumption. This was the reason why the Stockholm - Gothenburg line in Sweden was the choice for first electrification after the War, and it has been the basis on which some of the French railroads have selected the sections on which to apply hydraulically generated power.

Italy, Switzerland and Germany have been pioneers in the application of electricity to railroads since 1900. They did a great deal of experimental work toward developing the three-phase and single-phase systems to their present standards in Europe. England made an early start but did not go farther than the electrification of suburban service, except in an experimental way. None of the countries of Europe had more than a few hundred miles of electrification up to the time of the War, and then development was necessarily checked for a few years. The greater part of the European electrifications have come into existence since the War, in the years between 1922 and 1928. The growth during recent years has been to a great extent the result of fuel shortages during the War which all of the nations with hydraulic resources are eager to guard against in the future.

National Standards Adopted Abroad

Several of the countries in anticipation of extensive electrification and desiring to promote interchangeability, have adopted national standards for electrification. England has adopted direct current with 750 volts maximum for third rail operation, 1500 volts for main line service, and 3000 volts optional for the latter in special cases. France has adopted 1500-volt direct current for future work, with either third rail or overhead contact, and 3000 volts optional for special cases. Netherlands, Belgium, Spain and Czechoslovakia also favor 1500 volts. Norway, Sweden, Germany, Austria and Switzerland are committed to high-voltage single phase of low frequency. The trolley pressure is

15,000 volts at 16.7 cycles. Italy has a large installation of three-phase at the same low frequency. About 70 per cent of the extensive electrification in Italy is three-phase at 3000 to 3700 volts. The first electrifications in Italy were made in the mountainous regions of the North. The three-phase system was developed here and now extends as far south as Florence and Leghorn. Since 1925 the Italian State Railways have been at work on 120 miles of 3000-volt direct current between Naples and Foggia. Part of this line has been in service for some time and it is now the intention to use this system in the central and southern part of the country, retaining the three-phase system in the north.

All of these various systems in the different countries seem to be functioning satisfactorily. The choice of systems was originally made by the railways and the adoption of national standards followed. There has only been a small amount of change to comply with later standardization, except in France.

A Review of Foreign Progress

In England the electrification so far has been confined to suburban service around some of the larger cities. One railroad, the Southern, has at London the largest suburban electrification in the world. After the war all of the trunk line railways in England were consolidated into four systems for the purpose of operating economies. Each of the four has some suburban electrification. Some of the power is generated and some purchased from neighboring power companies.

In Holland, the lines are electrified between Amsterdam, The Hague, and Rotterdam, using multiple-unit trains and 1500-volt overhead. International trains and freight are still hauled over the same lines by steam. Power is purchased from three adjoining power systems and conversion is done for the most part by mercury arc rectifiers. This is a very recent electrification.

In Sweden there are two principal lines of the State Railways electrified. Each is about 300 miles long. One, in the northern part of the country, serves the iron mining regions, and carries a heavy tonnage of ore to tidewater. The latter was electrified before the War, using local water power developed by the State Power System. The reason was to increase carrying capacity. The other line, from Stockholm to Gothenburg, was recently changed from steam as a part of the national economic program. This line connects Stockholm, the capital and largest city, with Gothenburg, the principal port. Next to the northern line it carries the largest traffic in the country. Power for the Stockholm-Gothenburg line is supplied from the central interconnected zone of the State Power System of which the principal source is the large water-power station at Trollhattan.

In Germany there are four principal districts of electrification. The largest is in Bavaria where nearly all of the trains out of Munich move by electric power. Electricity is purchased from a large water-power system in which the State of Bavaria is largely interested.

In the mountain districts of Silesia, between the cities of Breslau and Gorlitz, there is considerable electrification for the purpose of utilizing local coal of rather poor grade that cannot be economically transported elsewhere. The power station for these lines is owned by the Government Railways.

In Middle Germany between Magdeburg, Leipzig and Halle is the other large district of main line electrification. This was established to utilize the brown coal deposits which are hardly more than a peat and contain about 60 per cent of moisture. This fuel has to be consumed on the spot and the Government Railways has a power plant especially adapted to consume it.

Most of the operations on these divisions of the German railways are conducted with locomotives, but they have also developed some very interesting motor cars to run on the 15,000-volt system.

The fourth important electrification of the German Government Railways is at Berlin. This comprises the whole suburban service including the so-called City and Ring Railway. Nearly 150 miles of line are involved. Current is supplied to multiple-unit trains with a third rail at 800 volts, direct current. This installation is well along toward completion and is noteworthy for the conversion equipment. There are 48 substations equipped with mercury arc rectifiers and supervisory control. There are from 2 to 8 rectifiers at each location and 119 in all. Power is purchased from local steam power companies over 30,000 and 110,000-volt lines.

In Switzerland, the principal standard-gage roads are the Federal Railways and the Bernese Alps Railway. The Federal Railways operate most of the important lines, except the Loetzchberg tunnel route operated by the Bernese Alps Railway. The Federal Railways have about 60 per cent of their line electrified and the other road is all electric. It is stated that 85 per cent of all traffic, ton-miles of both passenger and freight, is now hauled by electricity. The three longest tunnels in the world are operated by these railways, namely, the Simplon, St. Gotthard, and Loetschberg. The Federal Railways have constructed, mostly since 1918, a very extensive power generating and transmission system. There are six hydraulic stations totaling 377,000 kilowatts and 600 miles of transmission at 66,000 and 132,000 volts. This system is also interconnected with several large power companies, although the low railway frequency of 16.7 cycles makes direct connection impossible.

In Italy there are six types of electrification used by the State Railways. The two principal ones have been described above. The State Railways have been actively at work on electrification since 1901. They have also taken a leading part in development of hydraulic resources. They are interconnected with a large network of power companies in the north and with other systems in the central and southern parts. They buy and interchange energy and have some recourse to steam reserves in the northern part of the country. As in Switzerland, the interchange involves use of special 16.7 cycle generators by the commercial power companies, in the zone of 3-phase electrification, or else frequency converters.

In France the railways are privately owned, except one system operating in the territory between Paris and the coast. This line, called the State Railway, has a zone of suburban electrification on the west edge of Paris which was started in 1900. They use a third rail at 650 volts and purchase power from one of the Paris companies.

The Paris-Orleans Railway has electrified some suburban service and about 130 miles of main line extending south from Paris. They use 1500 volts with overhead contact line. They have developed water power along their line and are also interconnected with the steam stations of Paris.

The Paris, Lyons and Mediterranean Railway is using third rail at 1500 volts in the southeastern part of France. They have had a trial installation, on 16 miles of double track, in service for three years and are now extending it over some of their most difficult mountain lines. They purchase power from nearby water-power companies.

The Midi Railway has the most extensive electrification in France. Its territory extends across the southern end of the coutnry in a belt about 100 miles wide, including the northern slopes of the Pyrenees Mountains. Water power is abundant and they are farthest removed from the country's coal mines. They also have several long tunnels including the Somport tunnel between France and Spain, and another international tunnel now building. They have developed their own water powers and transmission system, and were also one of the first railways to make use of mercury arc rectifiers for 1500 volts.

Tendencies in Europe

Among the interesting tendencies in Europe are the following generalizations: (1) Electrification where adopted has been due to special conditions or national policy, and (2), there is a tendency toward closer working relationship between the railway power systems and the commercial networks in most countries, even though there are differences of frequency.

In conclusion, we in our country can congratulate ourselves that we do not face the complications of many governments, frontiers, policies and national standards. We have but two types of electrification in the United States—direct and alternating currents. Both are performing efficiently, and the power companies and manufacturers should unite in furnishing the railroads energy and equipment of whatever type they wish to purchase and on the most liberal terms and at the lowest possible cost, as the prosperity of the railroads and the efficiency and economy of their operation are vital to the welfare, growth and further development of our country. (Applause.)

PRESIDENT ARKWRIGHT: We are very grateful to Mr. Budd and his Committee for the very valuable work they have performed and the interetsing expression of it.

I have asked Chairman Sloan to let me intervene for just a moment. It has been suggested that you might like to send to Mr. Owen D. Young at Paris a cable conveying our congratulations on the apparent success of the German Reparations Conference, and expressing our pride in the part he has played in assisting in bringing this about. I will read to you the suggested cablegram:

"MR. OWEN D. YOUNG,
Ritz Hotel, Paris, France.

"The National Electric Light Association in convention assembled extends its heartiest congratulations to you on the successful culmination of your work as Chairman of the Committee of Experts on German Reparations. Such a notable contribution to the cause of international amity and peace reflects great glory and honor on all the delegates, and particularly on those Americans who were privileged to have a guiding hand in it. We, your countrymen and friends, want you to know how proud we are of this accomplishment, and take this means of apprising you of it."

If you would like to have the Association send this cablegram to Mr. Young on your behalf, will you please indicate it by saying "aye."

It is unanimously adopted. (Applause.)

CHAIRMAN SLOAN: The next speaker, Mr. George Gibbs of Gibbs & Hill, Consulting Engineers of New York City, has made a special study of railroad electrification in this country and abroad. He recommended and is responsible for the system of electrification of the underground railway of London. He is an authority on railroad electrification, consulting engineer for the New York, New Haven & Hartford Railroad, Pennsylvania Railroad, the Norfolk & Western Railroad, the Illinois Central Railroad and the Virginian Railway. It is with great pleasure that I present to you Mr. George Gibbs. (Applause.)

RAILWAY ELECTRIFICATION

BY GEORGE GIBBS,
Consulting Engineer, Gibbs & Hill, New York

The subject upon which I am permitted to address the Association is Railway Electrification. It is such a broad one that only certain of its high spots can be touched upon. I shall trace, therefore, very briefly, the reasons for electrification of steam railways, the results obtained, economic and otherwise, its limitations and, especially, the problem of power supply.

It will be noted that my remarks repeat, to some extent, some of the facts and thoughts expressed so admirably by Mr. Budd, the previous speaker. I trust the unintentional repetition will be pardoned.

The electrification of steam railways in the United States began over 30 years ago in a small way, at a time when the art was in its infancy, and when there was no real data available from actual experience as to the reliability and economy of this form of traction. Its growth of application was slow but fairly regular until the World War introduced a period of stagnation in new enterprises. Post-war adjustments, and the return of the railways to private ownership made it possible for the railway companies to proceed with major improvements, consequently numerous projects for electrification were proposed and several important ones put under way. This early history has been well set forth in the reports of the Electrification of Steam Railroads Committee of the Association.

It is interesting to note that the mileage of electrified railways in the United States, while considerable, does not present a very impressive total compared with that of all railways. There are over 250,000 miles of steam railways in the country, having an aggregate of about 420,000 miles of track, and there are about 63,000 locomotives in use. Electrified railways in operation total about 1665* route miles and 3990 track miles, and use about 450 electrified locomotives and 1780 motor cars. New projects now authorized and under way will add about 230 route miles and 720 track miles.

Purposes

The several reasons for adoption of electric traction by steam railways may be illustrated by following its step by step use on one of the great systems of the country—the Pennsylvania Railroad.

In the year 1902, that company determined upon building a great passenger terminal in the heart of New York City. It contemplated an underground station and yard to be reached by sixteen miles of tunnels passing underneath two rivers. A form of motive power for the trains other than steam was essential to the project. Economy was not a factor, it was only necessary that it be adequate and reliable.

For extensions to cross-country lines the case was different; and as the advantages of electric over steam might be important and had been at the time undetermined, the company undertook the electrification of its line from Camden to Atlantic City, N. J., a distance of 75 miles. This installation was completed in 1906 and may be regarded as an effort to determine the traffic-fostering possibilities, economy and reliability of handling long distance passenger services by electric motor-car trains.

Electrification of the Long Island Railroad

About the same time as these two projects were in progress, a subsidiary road—the Long Island—was faced with the necessity of removing its tracks from the surface of a street (Atlantic Avenue, Brooklyn). This was done by constructing tunnels and an elevated road. It was desired, also, to use the new Pennsylvania tunnels and terminal in New York City for certain of its suburban services. These various conditions necessitated the equipment of 90 route miles in various branches for electric operation to serve the two underground terminals within the city. This electrification was also one of necessity to conduct passenger services terminating within a great city, and under physical conditions prohibiting the use of steam locomotives.

The next undertaking of the company was at Philadelphia, and its purpose was an essentially different one. The Broad Street Station is a stub-end terminal serving all trains, through and suburban. The approach is by a long, elevated viaduct restricted in width by important city streets on either side. With growth of business, congestion and delays constantly occurred, largely on account of the great number of movements through the throat crossovers. A considerable number of these movements were "idle," i.e., empty suburban trains and their locomotives to and from the yard. It was imperative to do something for relief; the most practicable solution, adequate for a time at least, was to electrify the suburban services in order to use motor-car trains into the terminal. The reduction of idle movements thus secured, it was figured, would be equivalent to a 24 to 30 per cent increase in station capacity, depending upon the number of lines electrified. Even if the project should not result in important direct-operating savings over a steam traction, these would at least amount to something and relief from former congestion would be secured, whereas a widening of the approach viaduct would not give any operating saving. This case illustrates the possibility of effectively employing electric traction to increase capacity under certain special conditions.

The next undertaking was the electrification of the New York Connecting Railroad, finished in 1927. This is a two- and four-track line, largely for freight service but also for passenger trains into the Pennsylvania Station from the New York, New Haven & Hartford Railroad. The connection is over the Hell Gate Bridge and thence to the Pennsylvania company's tracks in Long Island City for passenger services. For freight the line connects with the Long Island Railroad, passing around the congested districts of the city to a terminal at Bay Ridge in the lower harbor, from which a car ferry runs to a large yard on the New Jersey shore. The purpose of this electrification was to effect operating economies and save time in the dispatch of freight from New England points to the South and West by avoiding a change from steam to electric engines within the city and to increase train weights handled over the heavy bridge grade. Also to deliver local freight electrically to industrial plants within the city.

Most Extensive Project Now Under Way

The latest and most far-reaching plan of the company involves full divisional main line electrification for all services on its four-track main line from New

---

* EDITOR'S NOTE: In the preceding paper by Mr. Budd the figures for lengths of line electrified and in process of electrification are larger than the corresponding figures in Mr. Gibbs' paper. This is due in the first case to inclusion of some small railroads not included by Mr. Gibbs, and in the second case due to inclusion of the whole program of electrification of the Pennsylvania Railroad extending over eight years, while Mr. Gibbs has included only that part being worked upon at present.

York to the South and West. It is by far the most extensive and costly project of the kind yet undertaken anywhere in miles of track to be electrified, in volume and density of passenger and freight business handled and in size and amount of equipment required. It will be done in sections; the first, from Philadelphia to Wilmington, is now complete; the second, from Philadelphia to Trenton, N. J., is under way; the other sections will follow immediately. The work is to be completed for through passenger trains hauled by electric locomotives at the time the new main passenger station at West Philadelphia is ready for service, and for operation of all suburban services by motor-car trains into a new underground terminal adjoining the present Broad Street Station. It will enable longer passenger trains and much heavier freight trains at high speed to be operated. This means an important saving in time and a clearing up of existing congestion on the New York Division. By making at the same time improvements in freight terminals and yards, new and desirable operating methods will be possible. All of these changes will, it is figured, result in large direct and indirect economies, and will increase business, especially in perishable commodities, and thus bring additional revenue to the company. This important electrification project may, therefore, be said to be for economy, for relief of congestion, as a revenue producer, and for the handling of through passenger service into two underground terminal stations (New York and Philadelphia) without change of power en route. The results, economic and otherwise, of this great undertaking will be watched with keenest interest by the railway world.

Other Important Electrifications

These enterprises of the Pennsylvania Railroad illustrate the progressive steps taken to develop heavy electric traction for all kinds of traffic, and for the general reasons which have usually guided railways in taking up such enterprises. As further illustrating the capabilities of the new motive power, there should be mentioned the installations on the Norfolk & Western and the Virginian Railways over the Alleghany Mountain grades. These—especially the latter case—employ the heaviest train units operated anywhere in the world. The Norfolk & Western electrification has been in successful operation since the year 1915; the Virginian started electrical operation in 1925. The reasons for both of these undertakings were the expected superior economy of electric traction for long freight train operation over heavy grades, the possibility of increased running speeds, and the consequent elimination of congestion at critical points on the lines. In these cases the roads were obliged to obtain in some way increased capacity at certain points which constituted "bottle-necks" in the divisional operation. Electrification obviated the necessity of undertaking track additions in a country where this would be unusually expensive, so that the estimated cost of the otherwise essential double-tracking might be considered as a credit against the cost of electrification. Under such circumstances, the direct savings from electric haulage, for the volume of business conducted, have more than carried the additional fixed charges and made the electrifications directly profitable.

Electric Haulage in Freight Yards

There is one other special field in which electric haulage has been found efficient and economical, and that is in freight yards for shunting and classification purposes. In such work electric locomotives are greatly superior to steam shifters in ease of control and prompt starting characteristics—a matter of importance in making short runs and numerous cuts; they are also very economical because they waste no fuel when not in motion. Electric shifting has been most largely employed up to date by the New Haven Railroad Company in one of their terminal yards. A profitable future field for yard operation by electricity will doubtless be found on many railways.

It is evident from the sketch above given that electric haulage has been tried out for every condition met with on steam railways; it has demonstrated by years of trial that the present development and perfection of apparatus from the power house down to the propelling wheel of the train will produce reliable and useful results from an operating standpoint; it is an efficient tool for railway use in effecting economies, and is often a "business-getter."

This is not a technical paper and, therefore, I cannot attempt to explain the electrical characteristics and differences of "systems." They may be defined and classified by the kind of current, "direct" or "alternating," used to propel the motors of the train. To the general public, the noticeable difference between systems is in the contact means used to furnish power to the train itself, as this feature obtrudes itself to view everywhere. It is either a contact rail alongside of and at or near the track level, or a wire and its supporting structures placed overhead. The first mentioned of these devices has a limited application. Therefore, as electrification has tended to extend its application to all railway distances and conditions of traffic, the third rail contact device has become out of date and has now practically disappeared from the picture; the overhead contact device has become the standard for all new railway electrifications. In starting upon the design of a traction installation, the plans determined upon as to system and power supply should be comprehensive enough to apply to unlimited extension of the electrification, and to conduct any and all the services of a trunk line railway; this means that any system adopted should possess the characteristics of flexibility and applicability to unlimited extension and unlimited power requirements at the train. All electrical traction systems now in use employ a centralized source or sources of primary power supply to be transmitted along the railways to local points, where it is transformed or converted into power suitable for use on the trains.

The first cost of electrifying a railway is very great. Speaking in very general terms, the equipment costs may be divided roughly into three parts, each of substantially the same magnitude, namely, one-third for the power generation, transmission and conversion; one-third for the distributing and contact elements, and one-third for the motive power on the trains. All of these are naturally subject to considerable variation, in accordance with the traffic and physical conditions of the particular railway. In addition, the application of electric traction requires a more or less extensive track rearrangement, the acquisition of additional real estate, changes in or removal of many structures, and radical changes in signal and communication systems. These taken together add a considerable sum to the first cost of an electrification.

It is because of high first cost that the progress of electrifying steam railways has been quite slow; even if the superior economy and the indirect advantages resulting could be shown to warrant the departures from steam traction, the prodigious outlay of new capital required has often made the changes impossible. The direct economies secured from electric traction are practically all in fuel saving, in train labor and in cost of repairs of motive power. These direct economies are produced in part by changes in operating methods, that is, by using heavier and fewer trains for a given volume of traffic and the elimination of stops, such as for coal and water; the saving is further influenced by changes in train speeds. All of these direct economies taken together may amount to a considerable sum, but unless traffic is very dense or the conditions very peculiar and favorable, such as heavy grade work, they will, unfortunately, not be found sufficient to pay a profit over and above the additional fixed charges which the railway must assume for the new equipment, and will sometimes not carry the charges even. The indirect savings are advantages anticipated; therefore are always very important in deciding upon an electrification.

Improvements in Steam Traction

During the past fifteen years great progress has been made by the railroads in effecting more intensive and economical use of their equipment and facilities. For instance, the accomplishments in improving steam locomotive design are impressive. In spite of large growth in business, there are actually fewer locomotives now in service than there were in 1914—63,000 now against 63,500 in 1914. The reason is that the amount of work performed per locomotive has greatly increased. Practically, the steam locomotive has been completely redesigned during this period. Its hauling capacity has been raised so that from the same number of locomotives the combined tractive effort is now 2,676,000,000 lb. against 1,932,000,000 lb. in 1914. The average locomotive weight has risen from 86 to 112 tons. The gross ton miles per locomotive have increased from 8810 to 19,679, and the average freight train speed (running and standing times included) has risen from 10 to 12.8 miles per hour.

The locomotive improvements made are in many directions—increased size and adhesive weight; larger boilers which require less forcing; automatic stokers; superheaters; feed-water heaters; improved valve motion, compounding; also the use of cast steel to lighten parts. While some of these add complication, the cost of repairs per locomotive mile has actually been reduced, and greatly reduced per ton mile hauled. By these improvements fuel economy has been increased and is now very satisfactory. In other ways also the railways have succeeded during the past few years in effecting more intensive use of their existing facilities, so that it becomes more and more difficult to make out a good case for the substitution of electric traction, as regards direct economies produced. This, of course, tends to reduce the field for same to special cases and for special conditions. This does not mean that electrification will stop, but it does mean that the complete supersession of the steam locomotive by the electric is in the far and dim distance. It also emphasizes the importance of proceeding with projects of the kind only after careful investigation of the probable returns to the railways and the public.

Compulsory Electrification

Agitation aimed to force railways to electrify should be discouraged; especially legislative enactments passed with little or no regard to cost or results. Such will only delay progress in meritorious projects. Thus, a number of years ago an ordinance was passed in Chicago compelling all railways to electrify within the city as a smoke abatement expedient. An impartial investigation of the probable results to both contending parties, by a committee of the Association of Commerce, showed that as regards smoke production the railways stood fourth on the list of industries in the city. The elimination of the steam locomotive would, therefore, not improve atmospheric conditions in very marked degree. As regards cost, the report showed that electrification within the city would cost on a pre-war basis, $190,000,000, and the "precipitated costs" outside $96,000,000 additional; these figures would be doubled, at least, now. The net yearly saving possible was shown to be only $2,337,000. This meant an annual deficit of $14,610,000—a huge continuing burden sought to be placed upon the railways and the public. Fortunately, the report was convincing and killed the project, but the whole incident has made the railways there hesitate to undertake any electrification for fear that a start would entail being forced to extend it beyond their ability to assume the burden.

A similar situation confronts the railways at present in New York State. The enactment of a legislative act seeks to compel them to discontinue the use of steam by electrifying all lines and services within the limits of cities of 1,000,000 or over population. As an example, this means for the Long Island Railway alone an expenditure of $23,000,000, of which about $10,000,000 would be required outside of the city to make such service usable. This is a staggering burden for a small road and must be assumed in advance of any real need for it or a sufficient practical return to any one.

All this sort of thing is very discouraging as regards real progress; railway companies should be trusted to adopt electric traction where it will increase comfort and attract business, or will reduce expenses so as to better meet decreasing rates and competition from other methods of transit. I am sure this association can be relied upon to favor this point of view and to oppose tendencies of a kind which may injure the railways.

Purchased vs. Railway Generated Power

As this association represents producers and distributors of electric energy for all public purposes, it is fitting that I should touch somewhat fully upon the characteristics of a suitable supply for heavy railway traction.

The services to be met are various, and introduce different load conditions; suburban traffic loads have high morning and afternoon peaks, the latter corresponding to commercial lighting peaks and coinciding roughly in time; heavy grade work—especially for freight—shows peaks occurring at random, due to the starting and bunching of long trains; accidental peaks occur in all services, due to congestion of business and power derangements which may occur at any time in any electrification and may spread over several hours' time. There may be, furthermore, abnormal passenger train peaks as the result of special movements, such as race meets, excursions, and the like. As electrification extends on a road and becomes divisional and is used for all services combined, the normal power curve smooths out and the load factor improves, but seasonal variations will still occur.

Formerly, and before the days of great commercial power companies having inter-connected systems, the railways were obliged to construct their own power plants for electric traction loads; now these outside wholesalers of power are found almost everywhere and are available for railway power supply. Mr. Samuel Insull, in his forceful paper before the American Institute of Electrical Engineers, in 1912, gave an elaborate analysis of the effect of railway loads in producing a diversity factor for a centralized power system, and in this way making it possible to reduce capital requirements and to effect a reduction in power rates of all kinds to the community at large. This paper is very interesting and, while out of date, it nevertheless accurately foretold some tendencies which have operated recently to concentrate the production of electrical energy for all purposes in the hands of a few large companies with modern plants inter-connected so as to produce reservoirs of power, each serving a large section of the country. This modern development is an important one and follows from the perfection of power house machines, high voltage transmission line construction, and especially in the perfection of switching and control apparatus, which make the huge reservoirs of power safe and usable.

The railway companies are much interested in this development, and in every sense of the word they wish to encourage it; it means cheap power for commercial purposes and the expansion of industry, which brings business. But it should be recognized that it will generally be detrimental from the power company's standpoint, to allow railway loads to be taken at random points on their distributing systems. Such loads, both as regards the power company and the railway itself, should be treated as block supply at a few points and as far as possible delivered on lines directly connected to the main load centers or power plants.

Requirements to Be Met

Discussing now the conditions under which a railway company can make use of this power supply, it is obvious that the energy furnished must be suitable, reliable and cheap. As to reliability, it may be conceded that a centralized commercial power system meets this essential. So does an up-to-date railway power plant; it has been found dependable. I should be willing to bank upon either source of supply in adopting an electrification project. It has often been pointed out that purchased power is produced by specialists while railway power is not. This, in a sense, is true, but in another it is not; railways have always specialized in power; every locomotive is a power plant; they surely can care for the central plant of an electrification. The question is, will they? Unfortunately (or fortunately, as you choose to look at it) it is difficult to bring this about. The power house is an incident only in a complicated chain of factors, making up the production of transportation, and the importance of keeping a power plant up to maximum efficiency and of taking advantage of progress in the art, not always fully understood by the higher officials who are responsible for expenditures. It is difficult, therefore, to get prompt authorization for large expenditures for modernization. With commercial companies, on the other hand, the power house and its successful operation are major considerations; the man in charge is a manager of the business, not a minor officer, reporting through the various departments up to the official who controls policy in making large expenditures.

The next point which should be referred to is that the purchase of power will relieve the railway company from a considerable capital expenditure for a plant of its own, and the periodic and heavy expenditures for modernization. These are undoubtedly advantages and constitute an inducement for a railway company to buy its electrical energy—but these advantages are not reflected in power costs as interest and depreciation charges accrue in either case and are elements in cost.

Considering the Final Cost

The third and most important consideration, however, is the final cost of energy delivered at the railway distribution system. If the electrification is a minor one, requiring a limited amount of energy, a small plant only is needed and this cannot compete in production cost with a large one. But in the case of a large and growing electrification, the fact should be recognized that a railway company can design and build a large, modern plant of its own, at a reasonable cost and can secure from it cheap and reliable power. Therefore, for an outside company to compete as to energy cost it is necessary that it should have in mind the following:

1. The effects of high capital costs of the power house, transmission and real estate. In some cases, apparently, excessive first cost has been due to the proximity of the plant to a large center of population; in others to an ultra-refinement of plans, aimed to produce energy at the lowest possible cost. A railway company can generally place its own plant in a cheap locality, centrally to its electrification and adjoining its right-of-way, and thus, by careful planning, reduce first cost of plant and transmission, and make competition with it difficult.
2. The relatively high interest charges paid by the power company for capital. This, together with high taxes paid and sometimes franchise taxes in addition, produce a high fixed charge, which becomes a part of the "demand" rate of the contract.
3. High staff and general office charges. A railway has a very low management overhead chargeable to power cost.
4. The small benefit which a company is apparently willing to accord the railway for the "diversity factor" produced in connection with its own load. In some kinds of railway traffic, such as suburban, there is probably little diversity obtainable by the power company taking over such a load, as suburban traffic peaks coincide roughly with the lighting peaks of a power company. If, however, through passenger and the various kinds of freight services are included, there may be a considerable diversity secured and which would help out a commercial power system. A railway may reasonably expect that its own load shall be considered a unit, both as to the requirements for its different services and as to location.
5. The amount of spare generating capacity allocated to the railway load. In a plant of its own, a railway company would, of course, provide for reserve capacity, but would exercise its judgment as to how far it would depend upon this in extraordinary emergencies, and how it would arrange its traffic in case of a shortage in emergencies. Commercial power companies generally go beyond this in figuring reserves, and I am not criticizing their policy; we expect them to safeguard our normal demands—perhaps more fully than we do ourselves; but the railways should not be penalized for the extraordinary emergency conditions heretofore mentioned by the establishment of new and higher "demand" charge. In other words, the railway should be able to obtain extra emergency power at "energy" cost, if and as the power company may have the capacity to supply it. It is not intended to ask that spare capacity be set aside for these occasional extra demands, in fact, many times the emergencies would come on the power company's off-peak times; but if the company has unused capacity during the emergency it should give it to us; the contract should not be punitive. If this policy be followed it would tend to reduce a high demand rate of the power company, and thus make purchased power more attractive to the railway.

Contract Provisions for Low Cost Power

The manner in which these various essential provisions for the production of low cost power to the railways have been incorporated in an important existing contract is summarized in the following:

1. The charges or rates are based on the actual cost to the power company of producing power in its generating stations and transmitting it to the railway supply points. This "actual cost" includes fixed charges, general expenses and all other items properly entering into the total cost, but it is based on production in large modern plants, not counting old and small plants, and is also based on certain allocated portions only of its transmission network.
2. In order that the railway may be protected against any unforeseen high cost of energy, such as a radical change in company set-up, the power company guarantees that the demand charge and the energy charge shall not exceed certain fixed values. Such guarantees are based on specific costs of coal and labor. Maximum rates for fixed charges are also stipulated.
3. The demand is determined monthly and is based on three maximum normal clock hours per month, with the stipulation that the demand in any succeeding month shall not be less than 75 per cent of any previous monthly demand.
4. Abnormal demands resulting from accidents, derangement of power supply, abnormally heavy traffic or unusually severe winter weather conditions are disregarded in determining the monthly demand.
5. If more favorable terms are subsequently made to other consumers under similar conditions of supply, the railway shall be entitled to the lower rates.
6. Power may be supplied at several points, but the demand is determined by combining the readings at all points; in other words, the railway gets the benefit of its own diversity factor; proper allowance for the company diversity is also reflected in the determination of the demand charge.

It is necessary now to close this short address upon a large subject. The remarks made in connection with power supply are offered only in the spirit of helpfulness to make possible the use by railways of power drawn from the great commercial supply systems, which are becoming an important national factor in aid of industry. It was necessary, in doing this, to emphasize the fact that cheap power is essential to the establishment and growth of electrified railways; that the direct savings in such form of operation are at the best, small, and the first cost very high. Therefore, both the railways and the power companies should cooperate in establishing contract conditions which will eliminate as far as possible all unnecessary handicaps to cheap power in order that the use of purchased energy for electrification may extend and benefit the community generally.

CHAIRMAN SLOAN: Because many of you may not have had an opportunity to see and hear the Talking-Movie presented yesterday morning by Sir Ernest Benn, of London, England, on "The Superiority of Private Enterprise," it will be shown again this morning. It will be followed immediately by a Talking-Movie address by Dr. Alberto Pirelli, of Milan, Italy, President, International Chamber of Commerce on "Electricity's Contribution to Commerce." This feature will be presented by W. H. Onken, Jr.

ELECTRICITY'S CONTRIBUTION TO COMMERCE*

BY DR. ALBERTO PIRELLI, OF MILAN, ITALY

President, International Chamber of Commerce

By way of introduction, may I extend to you and to the electrical industry throughout the United States, but more particularly to the great American savant and inventor, Thomas A. Edison, my personal congratulations as well as those of the International Chamber of Commerce, on this Golden Jubilee celebration.

Mr. Edison happens to have been born in the United States, but he belongs to the world. It would be idle for me to dwell on his many and beneficent inventions. Labor has been incessant with him, and his life is a song of hope to the youth of all lands. For none of us lives unto himself. Centuries ago a great poet of my own country expressed it thus: "Sic vos non vobis mellificatis apes." That is to say: "Not for yourselves, but for others do you produce honey bees."

As President of the International Chamber of Commerce, I am happy to voice the admiration of business men of forty-six nations, for the work of the inventor and for the development of scientific research. And in no place is this work more manifest than in the United States.

Your country is magnificent in its ideals, its citizenry, its power, its wealth and its possibilities. America is indeed "a land flowing with milk and honey," and it possesses besides a very real and extraordinary vitality giving to its work a freshness and a force which astonishes, and at the same time commands the admiration of the world.

Growth of Spirit of Brotherhood

It is a pleasure also for me to note the growing spirit of brotherhood shown by Americans generally toward other and older civilizations, especially in international and interracial relationships. The tendency is no longer to employ the American standard as a measure with which to judge others; but to study a country, its background, its people, its traditions and its psychology, and thus to find a way to live in a world of individuals with varying standards, varying ideas and ideals, varying strengths and weaknesses, and to understand them sympathetically. It is in this understanding of others, this getting into their lives and appreciating them, that the hope for international conciliation lies.

But my purpose is to bear tribute to the splendid record made by your industry, and to the position of the United States in matters electrical. No one knowing anything about the electric light and power industry can picture it as being or becoming static in any country, and least of all in the United States. Public appreciation of electricity arrives long before its economic victories. It was accepted that it would do the things that people expected of it, and it always exceeded expectations.

World Is Indebted to Edison

One great asset of electricity is that it has enabled countries like Italy, Switzerland, Norway, Sweden and others possessing little or no coal to develop their water powers for civic, domestic and industrial use, and has also made possible the conservation of other natural resources, to the great advantage of civilization. It has brought untold benefits to industry and commerce and has provided comforts and leisure for the home, so that great multitudes enjoy a freedom and a dignity beyond that which earlier civilizations allowed. And for much of this the world is indebted to the inventive genius of Edison.

Years ago Beethoven was conducting a performance of his Ninth Symphony. So moved and entranced with the beauty and majesty of the music did the audience become that they stood and applauded the composer enthusiastically. But Beethoven heard not, heeded not, for his ears were deaf to their cheers. For years Edison also has lived in the silence which Ibsen calls "the home of the strong," and my hope and heart's desire is that, if he cannot hear, he may at least sense how great is the gratitude of a world which his day salutes and cheers him as one of its worthiest inhabitants.

PRESIDENT ARKWRIGHT: Some things are beyond praise. To attempt to say anything in approval of this feature we have just had, would, I think, be to detract from it. I would, however, like to express again our great appreciation for these features, to W. H. Onken, Jr., and to the Western Electric Company, through whose generosity we were able to secure them.

---

* Presented as a "Talking-Movie."

The remainder of the morning session will be presided over by Vice-President J. F. Owens.

[Mr. Owens assumed the Chair.]

CHAIRMAN OWENS: The next speaker on the program will be the Chairman of the Commercial National Section. It is interesting to note that he was born in that great treasure house of the Nation, the Southwest. (I say that with all modesty.) (Laughter).

Mr. Sampsell has had a long and varied career in the utility business. In this Association, of which he is Vice-President, he has contributed much of his experience and his talents, and in no greater degree than the contribution he has made during the past year as head of this important Commercial Section. His contributions to that section, to the industry and to the Nation are great indeed. It is a pleasure to introduce Vice-President Marshall E. Sampsell, Chairman, of the Central Illinois Public Service Company, Chicago, Ill.

REPORT ON COMMERCIAL NATIONAL SECTION

By MARSHALL E. SAMPSELL, *Chairman*

If we have made commercial progress this administrative year, a great degree of credit belongs to Mr. Greenwood, the Vice-Chairman, committee Chairmen and committee members. We have received inspiring assistance from the officers and members of related committees throughout every Geographic Division, helpful counsel from Mr. Clapp and Headquarters, splendid cooperation from the other National Sections and Committees, and profited in large measure from our contacts with The Society for Electrical Development. It has been a pleasure and revelation to me to be associated with the sound-thinking, well-informed men and women who are so successfully carrying forward commercial work.

The Commercial National Section has approached its work this year with full appreciation that the Electrical Industry is a predominant factor in constructive upbuilding of American production. We realize the unique relationship of our industry with all commercial and industrial activities daily carried on throughout this country has afforded unequalled opportunity to reduce production costs by invention, science and standardization, thereby helping to establish and maintain exceptional wage and living conditions.

Our light and power companies can be justly proud of their contributions to the practical needs, comfort and welfare of the public generally and the millions of customers they serve. They cannot, however, rest complacently on past performance. To remain an agency for constructive achievement, they must take full advantage of present abundant opportunities and be ever alert to future possibilities.

We have kept in mind the billions of dollars our light and power companies have expended for facilities to conduct their business. We know, too, these dollars were not secured, except in small part, from earnings; but from the sale of bonds to financial institutions, preferred stocks to individual investors, including a veritable army of company customers, and common stocks, in most part, to investment companies, without whose assistance through such purchase and extension of general credit, management and engineering skill, our operating companies could not have properly kept pace with their rapidly expanding business.

The Industry's Present Problem

We realize we are no longer living in the years during and following the war, when we were seriously put to it to provide facilities to serve our fast-increasing loads. Our problem during those trying years was: How can we finance additions to our properties to carry the loads brought to us without solicitation? Our problem now is: How can we most intelligently bring about greater diversification in the distribution of our product—electricity—to more surely safeguard the heavy investments already made, and yet to be made, for generating capacity and distributing facilities?

To protect investments made in transmission lines interconnecting smaller communities and extending into rural districts, where there exists little industrial activity, requires larger volume of electric service in small-town homes and on the farm. To successfully meet these obligations, we must sell more kilowatt hours through intensive development of new markets that will improve load factor. To bring about and proportionately enjoy intensive development of these new markets is no boy's play. In this undertaking we are forced to meet keen, well-organized competition from other industries, equally anxious to grow and prosper.

To intelligently educate our present customers and others to greater and more diversified use of our service, provide them with suitable energy-consuming devices to enable them to so use the service, and obtain more helpful information for the industry, the Commercial Section was reorganized last August into four bureaus, namely: Lighting, Merchandising, Commercial and Industrial Power and Heating, and General. Each bureau, except the General Bureau, embraces certain committees of related activities and is under a Vice-Chairman. The General Bureau committees report to the Section's Chairman. This arrangement has coordinated our own committees, harmonized more completely with Geographic

Division related committees, permitted separate bureau meetings, and made unnecessary frequent group meetings of the Commercial Section. Excellent cooperation from Geographic Division has resulted in increased attention to commercial development throughout the country.

"More Kilowatt Hours Through Group Teamwork"

The slogan of the Commercial National Section last year was: "More Kilowatt Hours Per Capita." Our slogan this year is: "More Kilowatt Hours Through Group Teamwork."

If our industry is to secure a large share of the consumer dollar, the executives of our operating companies must bring about closer departmental teamwork within each company, so that our engineers, accountants and other principal operating officials may look beyond the specific work they perform into the commercial field where cooperative effort is now required. This cooperative effort will lessen sales resistance and assure new service income that will result in financial advantage to the company and rate advantage to the customer, whose consumption of more kilowatt hours, better diversified, provides the basic source of net earnings for the company.

Group teamwork is equally essential between our National Association and the respective Geographic Divisions and State Associations. Our National Sections were undoubtedly created to better perform work most closely related to subjects assigned them, and it is only by group teamwork between these separate National Sections and corresponding sections or committees of Geographic Divisions that we can expect to properly handle the mass of work involved at least expenditure of money, time and human effort.

It would therefore seem the slogan, "More Kilowatt Hours Through Group Teamwork," accurately describes the goal we have in mind for our Association, whose avowed purpose is: "To Advance the Art and Science of the Production, Distribution and Use of Electrical Energy for Public Service."

The need for group teamwork between our four major national associations and the electrical leagues was the impelling reason for reorganization of the Society for Electrical Development in 1927, resulting in more sympathetic understanding of the commercial problems that so vitally affect the electrical industry.

We have kept before us our common need for greater consumption per unit of industrial power and domestic service and the existing possibilities for scientific development and diversification of commercial and industrial power and lighting. Consequently, we have been studying the principal handicaps to our commercial progress and planning how to deal with them.

Handicaps to Commercial Progress

One of the most serious handicaps to commercial progress is adequacy and price of wiring, due largely to code restrictions. The principal reason wiring in general is not adequate is that ADEQUACY has not been sold. Present costs of wiring are perhaps not too high under the conditions of present wiring jobs. Our Wiring Sales Committee has been working with the Codes and Standards Committee and Engineering Section on the National Electrical Code and the whole wiring situation. We have had several joint meetings with representatives of the National Electric Manufacturers Association respecting certain drastic changes in grounding rules. These meetings have been of value to the entire electrical industry and afford concrete example of the advantages of group teamwork.

Another serious handicap to our commercial progress is that our rate structures are not sufficiently conducive to broad promotion of electricity. It is not contended these rates are too high, but that their form is not calculated to encourage the most liberal use of energy, which must result in a lower average rate to the consumer. The price of energy is one problem over which our electric light and power companies have most control, and, if we can solve that problem, we can better compose commercial problems in which others have a mutual and beneficial interest. The Promotional Rates Committee of our Section has been studying rate forms for domestic service and the relation of existing rates to development of household appliance loads.

Another handicap to our commercial progress is price of energy utilization equipment and quality standards in types of appliances. Prices may not be too high for the present demand, but are they not too high to permit universal acceptance and use of them by the average housewife who perhaps needs them most? Our Section is carefully examining quality standards, as affecting costs, performance, and market acceptance of both low and high-priced models.

Our intensive study of handicaps to commercial progress has not caused us to lose sight of other avenues for load building.

Training of Commercial Men

We appreciate our business is each year becoming more highly specialized. To stimulate intensive training of commercial men working in specialized fields, training schools have been held during the year, covering Electrical Advertising, Home Lighting, Industrial Heating and Commercial Cooking. The success of these undertakings merits repeating them.

Higher Standards of Illumination

Our Section has made conspicuous progress in impressing the advantages of proper illumination, instead of lighting for vision only. Through group teamwork with architects and lighting departments of our companies, we are bringing about more adequate wiring for higher standards of illumination. The method of marketing electricity for electrical advertising and lighting of streets and highways is being pushed, both for its commercial value and civic betterment.

Our power committees are studying commerce and industry to more intensely promote electricity for every power and heating need. Highly creditable reports covering specialized fields have been developed to equip our salesmen to show the advantages of electric power over supposedly more efficient means offered by our competitors.

Another phase of our Section's work has consisted of searching for facts concerning particular classifications of our business.

Water Heating Survey Underway

A Water Heating Survey of national importance is under way, the field work being done by the Engineering Section, at Headquarters. This survey will doubtless clearly indicate the water heating service is of value to the customer and affords wide opportunity for desirable revenue.

Farm Appliance Sales Committee Active

Another fact-finding undertaking of consequence to rural customers and our business is the work of the Farm Appliance Sales Committee. Its personnel includes representatives from the Rural Electric Service and our Merchandise Sales Committees.

Plan of Refrigeration Committee

An activity deserving particular support is the plan of our Refrigeration Committee to nationally point out the relationship of food preservation to health. This plan is non-commercial, includes all groups interested in food preservation, and will be carried to completion by the National Food Preservation Council, of which Matthew S. Sloan is President. The details of this program will be outlined to you at this morning's session by P. B. Zimmerman.

Electrical Industry Sales Conference

Under the auspices of The Society for Electrical Development, the Commercial Section is taking part in a thorough-going search for facts as to adequacy of wiring in typical American homes; number and nature of electrical appliances used in the average household, consumer interest and appreciation of the value of electricity, and ways and means to develop a larger market for electricity in the homes of this country. This survey was made by a leading advertising agency under specific instructions of the Sales Plan Committee of the Electrical Industry Sales Conference. At this afternoon's session of the Commercial National Section, W. W. Freeman, President of the Society for Electrical Development, will discuss the present status of this plan, its value as an agency for intensive development of our markets, its advantages as a messenger of good-will and far-reaching benefits to all elements in the electrical industry.

"Service Suggestions" Supply Useful Information

Our Association's monthly Bulletin has carried the Service Suggestions of the Customer Relations Committee. The informative and useful data furnished through this committee has doubtless been followed with interest by all commercial executives and field men.

Our Section is cooperating with the Accounting Section, through a joint committee, in further effort to adjust the accounting problems our enlarged commercial activities have occasioned.

Merchandising Methods Studied

The Commercial Section has been closely studying merchandising methods of others engaged in selling household electrical equipment. Despite our close contact with our domestic customers, we can never satisfactorily develop a maximum volume of appliance sales until we have the complete and cordial support of all other classes of merchandisers of electrical appliances. It is not to our interest nor have we the slightest desire, to monopolize the appliance business. It is our desire to so plan our sales programs as to encourage and assist the manufacturers and dealers who are helping us promote acceptable labor-saving and convenience services. It is respectfully recommended that the Declaration of General Merchandising Principles agreed to by all concerned and the electrical merchandising standards suggested by the General Merchandising Committee of our Association be followed as guideposts to better trade relations.

Participation in Light's Golden Jubilee

Just a few years ago, the local craftsmen carried on the manufacturing of the country and business consisted of small isolated transactions. There was no such thing as massed production, massed capital or corporate machinery. Events of importance were known many moons after their occurrence. Light came to us from the tallow candle, kerosene lamp, and open fireplace. The kilowatt hour, the untiring helpmate of humanity, was a stranger in the home. workshop and on the farm.

Today we are fully advised of the world's activities when and as they take place. The radio, telephone, and telegraph and transportation on rail, rubber and in the air make time and place factors of small consequence. The availability of electricity for countless light, heat and power purposes has raised man's stooping shoulders from endless labor and relieved the weary housewife of hours of toil.

To one man, above all others, is due this marvelous transition from primitive days into an era of ever-increasing growth and expansion of industry, business, transportation, and communication. He has made it possible for us to translate the dreams of our electrical industry into time and labor-saving realities.

The commercial members of the light and power companies throughout our land are impatiently anxious to participate with all the world in honoring that man, Thomas A. Edison, and through Light's Golden Jubilee, to felicitate him on the occasion of the fiftieth anniversary of his invention of the first practical incandescent lamp and the system of electrical distribution that has made possible our own great industry whose good name we so zealously guard. (Applause.)

CHAIRMAN OWENS: This most eloquent presentation is one of the most valuable commercial presentations, I think, that has been made to any convention. It is also, in my judgment, one of the best public relations talks I have ever heard.

The next speaker on the program will be P. B. Zimmerman, Secretary, National Food Preservation Council, the functions of which have been alluded to by Mr. Sampsell. Mr. Zimmerman will speak on the National Food Preservation Program.

NATIONAL FOOD PRESERVATION PROGRAM

BY P. B. ZIMMERMAN
Secretary, National Food Preservation Council

Teaching the millions that 50 degrees is the danger line on the thermometer, for the proper preservation of food, is the object of a nation-wide activity now being rapidly organized by the National Electric Light Association. The thermometer, as is illustrated on the stage, will be the emblem of this campaign. At the suggestion of the Refrigeration Committee of the Commercial Section, the movement, as it has been undertaken, will be known as the Food Preservation Program. It will be centered so far as the public attention is concerned, in the month of September, although preliminary work will be going on actively throughout the year. The fundamental purpose of the whole program will be to impress the American public in a campaign so dominating and so widespread, that it will cover every part of the nation.

The Program's Objectives

The four principal objectives are as follows:

First, to establish the relationship between food, spoilage, and health.

Second, to establish in the public mind, a perishable food temperature of 50 degrees, or less.

Third, the causes of food decay and bacteria growth.

Fourth, the vital need for proper all the year around refrigeration.

Every avenue of advertising and promotion, national and local, will be employed to focus public attention on the benefits to health and the economy of proper refrigeration. Dominant advertising in national magazines will be the primary instruments. Newspaper advertising and radio broadcasting will add to the effect of the magazines, as well as magazine articles by recognized authorities on the need for proper care of food to prevent decay, addresses before community gathering, and complete local tieup with the program by the factors interested in public health and in the merchandising of refrigeration.

The month of September was selected for the program for two reasons: First, because it offers an opportunity to emphasize to the American public the need for the proper refrigeration the year around; second, because it will stimulate sales at a time when there is a tendency to relax selling effort. It has been accepted by many merchandisers of automatic refrigeration, in the northern states particularly, that concentrated selling effort has been worth while only in the summer months. The program will point out that the Weather Bureau's records show that 50 degrees, the danger line in food preservation, is maintained in outdoor temperature only 19 days a year, as a national average.

The governing body of the program will be the National Food Preservation Council. Matthew S. Sloan is President; Vice-Presidents are J. E. Davidson and C. E. Greenwood; Mr. Sampsell has taken the chairmanship of the Executive Committee.

On this Council will be the representative heads of each of the food industries who are being invited to participate in this movement.

How the Program Will Be Carried Out

The program will be carried out by both national and local advertising,—the national activity directed by the Council and its committees, the local activity by the local councils which are being set up through a regional organization that will extend into every community. For this purpose, the entire country has been divided into 20 districts. Regional directors have been appointed for each district, and are now at work. The Council has engaged the services of 10 traveling specialists who will assist the regional directors in their field service. The local Council will, in most cases, center around the electric leagues where they exist, and will include all the electric interests—the gas company, the ice company, the milk company, merchandisers of refrigeration, and the purveyors of perishable food. The medical societies in many cases, and also women's clubs, will be primary factors in the local associations. The national trade and public health associations, which have been invited to participate in the program and to appoint representatives on the national council, are the following: The American Medical Association, The General Federation of Women's Clubs, The American Gas Association, the National Association of Ice Industry. The National Refrigerator Manufacturers' Association, the International Association of Ice Cream Manufacturers. The plan for the national activity includes full-column advertisements in the national magazines, which in most cases will be distributed both during August and September, as well as items by authors, whose names will carry weight with the American public, on the benefits which the habit of proper food preservation will induce in the health of the nation. Full editorial support of this program has been promised by a number of publications, among them the principal women's magazines of America. The Speaker's Bureau is another activity of the National Council. Arrangements have been made with health authorities—women who are widely-known for their interest and development of better health and science.

Another division of the Council is the preparation of material such as newspaper advertisements, articles, window displays, truck cars, special banners, and a complete set of dealer advertising material.

National Idea Contest

Lastly, there is a National Idea Contest, for which $25,000 has been appropriated. The principal prize will be an electrical home. The national program will be supplemented by similar programs of activity throughout the month in every community of the country, under the supervision of the regional directors, with the active control in the hands of the local committee. There will be extensive newspaper advertisements. The National Council is also supplying service such as outdoor advertising and many special forms that have been demanded by the committees.

Women's Committees to Help

The entire energy of the women's committees which have done such an effective work for many utilities will be directed along the food preservation lines for this month.

Time is brief and I shall not enumerate the many details of the plan. A plan book will be sent to each member company.

This is the first opportunity, we understand, that the electrical industry has had to cooperate with the food industries. The average American family is spending $629 for foodstuffs. It has been estimated that some 10 per cent of this goes to waste, and that if there were a full realization of this 50 degree danger line, we might save, in this country, something like a sum of $700,000,000 that is wasted. Economically it would pay for this great service, and it would be a great benefit to the public and to this industry.

We, therefore, solicit the active cooperation of each member company when the regional director calls upon you for help and service. (Applause.)

CHAIRMAN OWENS: The next speaker on the program, like Mr. Sampsell, was born in the Southwest. He has had an interesting experience, having been identified with several of the light and power companies in that section. He is now President of five companies supplying light and power service to the Greater New York area. He is a past-president of the Edison Illuminating Society. He is First Vice-President of the National Electric Light Association. It is with great pleasure that I present to you Matthew S. Sloan, who will now address you.

SALES INCREASE OR RATE INCREASE

By MATTHEW S. SLOAN

President, The New York Edison Company, New York

The title I have chosen for this paper is not intended to indicate an alarmist state of mind. It is intended, however, to call to the attention of our industry, facts which seem to me worthy of our careful study. The situation is not at present one which should alarm us. It should not be permitted to get to a point where it does become alarming.

Trends in our industry over a period of several years show that it is slowly being squeezed between the jaws of a pair of pincers.

One jaw is a decline in the kilowatt hour sales and revenue for each dollar of investment.

The other jaw is a rising investment per kilowatt of installed generating capacity.

In spite of this squeezing, our rate of return has lowered only slightly in the period under consideration. The return has thus held up because of a splendid steady increase in operating efficiency produced by our engineers, and economies in financing and other phases of management produced by consolidations and groupings of operating companies. The excellent financial showings the electrical utilities in general are able to make at present are a tribute to technical progressiveness and administrative ability. They must in time, however, reflect the trends in sales and investment if those are not corrected.

The pictures I am using in this paper were collected by the Statistical Department of our Association from its own records, and data of the Census Bureau. They cover the entire electricity supply industry of the country, with inter-company sales eliminated.

In 1922 there were sold 7.54 kw-hr. for each dollar invested in plant and equipment. In 1927 this figure dropped to 6.61 kw-hr., a decrease of 12½ per cent.

The average price a kilowatt hour sold in 1922 was 2.81 cents, while in 1927 it was 2.71 cents, a decrease of 3½ per cent.

The revenue for the dollar of investment in 1922 was 21.1 cents. In 1927 it had decreased to 17.9, or 15 per cent.

The 1922 rate of capital turnover was once in 4.72 years. In 1927 it was once in 5.58 years, or 18 per cent longer.

In this period, from 1922 to 1927, the installed generating capacity increased 78 per cent. The average generation per kilowatt installed increased 4 per cent. The investment per kilowatt installed increased from $312 to $367, or 17½ per cent.

The balance available for interest, dividends and surplus showed an average rate of return for the
7.30 per cent. In 1927 it was 7.48 per cent.
industry in 1922 of 7.58 per cent. In 1926 it was

In order that these facts may be seen in their proper relationship, it is necessary to interpret them by the introduction of paralleling facts. As we all know, there have been, in recent years, many rate reductions, particularly in domestic or household rates. As an industry, we take pride in the fact that electricity is the only item in the cost of living figures, compiled by the Federal Government, which is lower now than it was before the World War. That, in part at least, accounts for the steady decrease in the revenue received for each dollar of investment.

Built Ahead of Demand

Since the war, our industry has carried on a tremendous building program. In the last few years, which have been a period of great business activity, general prosperity and easy money—that is, capital readily available on good terms for enterprises of merit—we have vastly enlarged our plant capacity and transmission and distribution equipment. As an industry, we have invested in such extension each year three-quarters of a billion dollars, or more. We have made up for any deficiencies of construction during the war period and have built ahead of demand, as it was our duty to do. We have built into less densely populated territory, into the smaller and more remote communities, into rural districts, to reach farm customers wherever practicable. The net result of that has been that costs of transmission and distribution facilities have been heavier in proportion to the unit of energy sold than when we were dealing with large city groups, or even the average of urban population.

This condition will continue. In very large degree, the urban population of the country is now on our lines. Aside from the natural growth of population, the new customers we shall obtain will be those in the outlying districts, so it is not reasonable to suppose that investment costs will turn downward.

Now with those elements taken into consideration, what do our figures show us?

First, the average revenue a kilowatt sold to the ultimate user is just about stabilized. The tendency, however, is downward.

Second, the trend of revenue in relation to the dollar of investment is distinctly downward.

Third, the time of capital turnover is markedly lengthening.

Fourth, the investment per kilowatt of installed generating capacity is increasing.

Fifth, the return on the investment has been approximately stabilized since 1922.

On that showing, the question, "Shall we increase our sales or our rates?" becomes distinctly and sharply pertinent.

Sales Increase the Only Answer

There can be but one answer to that question. We do not want to seek rate increases. We want to continue the course of our industry's development, which has been marked by a steady decline in prices charged for service. We could not afford to raise the prices now even if we did want to, for such a policy would inevitably decrease our sales and antagonize the public.

The answer to this question then is that we must increase our sales. We must sell more kilowatt hours for each dollar of investment, making our equipment work harder and steadier, and the place to sell more service, in my judgment, is in the home. There are nineteen million homes on our lines. The average use of electricity in these homes is figured at 456 kilowatt hours during 1928. That represents an increase of 27 kw-hr. over 1927, which year produced an increase of 25 kw-hr. over 1926. It is gratifying that there were these increases, yet their size really does not seem anything to cheer about.

This figure of 456 kw-hr., please remember, is the average for the country. In many districts of the country it is exceeded largely. There are, for example, annual sales of 546 kw-hr at an average price of 4.94 cents, of 580 kw-hr. at 4.52 cents, of 577 kw-hr. at 4.84 cents, of 717 kw-hr. at 4.88 cents, and 735 kw-hr. at 3.3 cents.

It is obviously not likely that every electric utility can equal such sales. It is distinctly possible, however, for most companies so to increase their domestic sales that the average for the country will jump a good deal more than 25 or 27 kw-hr. a year.

Reasons for Stimulating Domestic Sales

Domestic sales should be vigorously stimulated for several reasons. The first is that they are and always will remain the backbone of our business. Industrial use of electricity, and to a somewhat less extent, commercial use, will fluctuate with the state of business health of the country. We have seen this in recent years. In 1922 industrial sales were about 6 per cent below the average. In 1926 they were about 6 per cent above.

There is very little fluctuation in domestic use of our service. Household habits become fixed. A household accustomed to the convenience and value of electricity will curtail its use only under the direct necessity. When we add to the domestic load, therefore, we put on what amounts to a permanent increase in business.

Another reason is that domestic business is highly desirable business. Once the customer is beyond the point of use, which pays for the fixed expenses of serving him, the chief expense incurred by the company in furnishing additional kilowatt hours is that of generating the energy. Moreover, increased domestic load is an important element in improving the company's load factor.

The third reason is that the customer who makes the largest use of service is, in all human probability, the best satisfied customer. We seek to improve our relations with the public by furnishing information about our business, by public speaking, by advertising.

We have every possible incentive to create a body of customers in homes all over the land who are using so much service and getting so much comfort and convenience out of the use of service that they thoroughly and genuinely appreciate its worth.

A fourth reason is that we have a social duty to increase the domestic use of electricity. Electric utilities are not alone business enterprises. They are also organizations for public service. They obtain their franchises on that basis. With them they acquired certain responsibilities. One of these responsibilities, as I see it, is to do everything possible to make their service most widely useful to the public. Naturally, as a matter of plain ordinary business policy, we seek to sell as much service as we can. My point is that we have for sale more than kilowatt hours. We have for sale, comfort, convenience, time-saving and freedom from drudgery. We have for sale better home conditions, higher standards of living.

Making Electricity More Used and More Useful in the Home

It is our privilege and duty to approach our sales problem from that point of view as well as from the point of view of increasing our revenues. If we neglect it, we may be sound business organizations but we fail to live up to our responsibilities as public utilities. Our industry has been criticized not a little on just that point, and I think we deserve the criticism in exactly the measure in which we omit any effort, practices or policies, which may properly be adopted to make electric service more used and more useful in the home.

It seems to me more than a coincidence that in every case I know of a reduction in domestic electric rates has been followed by increased use of service. There may be instances where this was not true, but they have not come to my attention. It was true in Brooklyn under conditions which covered a series of reductions over a period of several years. It has been true in upstate New York, in New England, in the Middle West, and on the Pacific Coast. Those companies which show the highest annual domestic sales also show the lowest rates. We have, therefore, in the experience of our industry what may be accepted as a guiding principle in stimulation of sales of service for domestic use. The way to increase such sales is wisely and properly to lower the domestic rates.

The Inducement Rate

Moreover, there is within the experience of the industry in recent years, a guide to the general form of rate schedule effective in increasing domestic sales rapidly, what has come to be known as the inducement rate. In this there is either a minimum charge or a charge for the first few kilowatt hours at sufficient rate to cover the fixed charges of serving the customer, after which comes a kilowatt hour charge lowering rapidly as the use of service increases.

You are all familiar with the theory itself, whatever its variations in rate structures for particular localities. This theory works. Such a rate schedule actually does what the name indicates. It induces larger sales of kilowatt hours, and that, it appears to me, is what we are all after.

For a number of years we have been patting ourselves on the back over the million and a half new homes brought on our lines each year. In truth, the figures have represented a high tribute to the value of electric service and have been something about which we might properly be gratified. Yet, having obtained these customers, we have not been doing our full duty to our companies in respect of them, neither have we been doing our full duty to them. We have not been selling these customers all the electric service they could profitably use in the various processes of running a modern household.

Here with our nineteen million domestic customers is a field to cultivate which will yield us, properly cultivated, more sales to the dollar of investment without adding to that investment; which will increase the average revenue to the dollar of investment, even on lowered rates, which will tend to shorten the time of capital turnover, which will produce a practically permanent increase of sales not subject to the fluctuations due to business depression. These advantages we stand to gain, plus the great and valuable advantage of having this enormous body of customers better satisfied with our service because it is doing more for them.

Who Knows the Limit of Domestic Sales?

Here is a situation, it seems to me, which concerns all companies in our industry, because however well any may be doing in respect to domestic sales, none has reached the limit of possibility. Indeed, who can tell what the limit is when Mr. Edison himself says that electricity will not have done its full job as long as humanity uses for any tasks some agency which electric service could better. Obviously each company will have to meet this situation according to its own local conditions and in its own time and manner. Each company, however, will have to meet it. Our nation's standards of living do not stand still. They are constantly being revised upward. Society's demands upon our industry do not stand still. They also are constantly being revised, and on the whole I believe in no unfair spirit.

Clearly, the demand now is for a way of making possible more use of electric service in the American home. That demand coincides with our need as an industry, and there is within the industry the experience and general indication of how to meet it with mutual benefit. (Applause.)

CHAIRMAN OWENS: I am sure that no greater contribution to the industry and to the nation, in the form of a speech has ever been made in the National Electric Light Association Convention. I desire to compliment the audience on the degree to which they have listened and have remained in the hall. I assure you that you have a treat before you in the next speaker. Before I introduce him, I ask your indulgence to make a brief announcement.

Tomorrow morning the front center sections will be reserved for the Edison Pioneers and their Ladies.

After the next speaker has concluded, you will have a very interesting, and I assure you a very unique announcement to be made by Mr. Sidney

Mitchell, President of the Electric Bond & Share Co. I hope no one will leave, because I am sure that this will challenge you.

The next speaker has had a most colorful career. It seems to me as I read his record, that about all the honors that could come to any single individual in engineering or in business life, have been given to him. He is the vice-president of one of the greatest business organizations in the world, The American Telephone & Telegraph Co. I am proud to present to this audience, Mr. John J. Carty, who will now address you. (Applause).

SCIENCE AND PROGRESS IN THE INDUSTRIES

By JOHN J. CARTY

Vice-President, American Telephone & Telegraph Co., New York.

On this occasion which marks the semi-centennial of the incandescent electric light, it is my privilege to address the National Electric Light Association on the subject of "Science and Progress in the Industries."

The unparalleled advances which have been made by the members of this Association, in extending the benefits of light and power even to the most remote hamlets of the land, are due to many causes, scientific, economic, and administrative. You have made enduring contributions to the economic welfare of the country, which are destined as time goes on, to bring about in our social and industrial life still greater improvements, the nature of which we can as yet only dimly perceive. Fifty years ago, service such as you are now rendering to the public was unknown; it did not then even exist. But today this service which you have organized is so vital that without it the present industrial structure itself could not exist. Behind all this lies a story of American enterprise, of administrative capacity, and of a public service effectively rendered, which is worthy of the admiration of all.

The historian of the future, writing with that perspective and with that detached state of mind which comes with the lapse of time, will find in the achievements of the members of this Association material for one of the most interesting chapters in the history of American industry. While he will justly appraise the effectiveness of your organization and the spirit of service which actuates your employees, he will show much better than can now be done how dependent is progress in your industry upon the advancement of science.

It has been said that next to the verdict of history, the observations of foreign contemporaries are calculated to give a trustworthy estimate of the achievements, the progress, and status of a nation. There may be enough truth in this to afford some measure of justification for me, as an engineer outside of the electric light and power industry, in venturing to discuss some of the relations of science to the remarkable progress which you have made. I shall speak, therefore, as one interested in the advancement of science, but detached from your activities —commenting as an observer who has followed attentively the progress which you have made in your industry from the time of its inception.

One of the outstanding factors in the success of the electric light and power industry is its encouragement and support of laboratories for research in applied science. In the operation of these laboratories, millions of dollars are expended each year, and thousands of men are employed, including engineers and scientists distinguished for their achievements in so many departments including physics and chemistry. They have perfected generators, motors, transformers and prime movers. They have made contributions to transportation, commerce and industry. They have provided agencies for the advancement of medicine and surgery, and they have contributed in countless ways to the social welfare. Every individual, whether on the farm or in the office or workshop, whether at home or in a hospital or at church or in the theater, is receiving the benefits of these achievements. Whether traveling on land or at sea or in the air, our safety and comfort and ease of transport are dependent far more than is yet realized upon the work of your industrial scientists. Volumes would be required to show how their manifold products have transformed and enriched our daily lives.

Research and Cost Reductions

But let me give a specific illustration which seems to be in a special manner appropriate on this occasion which marks the semi-centennial of the incandescent electric light, which was the invention of our great scientist and inventor, Thomas A. Edison, Let us go back only to the year 1907, which marks the introduction of the metallic filament lamp, and consider some of the progress which has been made in the electric lamp since that date.

By the year 1907, the improved carbon lamp, as the result of incessant scientific experimentation, had reached an efficiency giving an illuminating power of about 3 lumens (3.4) for each watt of energy employed. In that year, 1907, and as the result of profound research conducted by distinguished scientists in your industrial laboratories, a great forward step was taken in the introduction of the metallic filament lamp, which rapidly displaced even the best of the carbon lamps.

The tungsten filament lamp of 1928 which is the one now in general use, yields more than 14 lumens (14.5.) per watt of energy. Thus it is more than 4 times (4.26) as efficient as the best carbon lamp of 1907, assuming in the comparison the same average size and the same hours of life.

Trustworthy figures show that in the United

States alone, during the year 1928, the total expenditure by the public for lighting by means of the incandescent lamp was, in round figures, $600,000,000. If that same amount of illumination had to be provided by means of the best carbon light of 1907, then more than 4 times (4.26) as much electrical energy would have been required, and the bill for lighting which the public would then have to pay would be multiplied accordingly. The $600,000,000 would become $2,556,000;000. Were it not for the reduction in the cost in the generation and distribution of electric current which you have brought about since 1907, this figure would have to be increased by $300,000,000. From this it will be seen that the total reduction due to these items alone, is now well over two billion dollars a year ($2,256,000,000.)

This sum, almost incredible in amount, represents a cost reduction brought about by one of the products of the electric light and power laboratories—the modern tungsten filament lamp—and by the improved methods of generating and distributing current which your scientists have developed. These figures will grow larger each year, even though no further improvements should be made. They take no account of the savings due to the prices at which incandescent electric lamps and electrical machinery are now sold when compared with the prices of 25 years ago. Nor do they include any appraisal of the contributions which your industrial scientific research has made to the present unexampled prosperity of the American industries.

These figures furnish the simplest method of emphasizing the progress which science has made in your industry in the generation and distribution of electric light and power. But taken alone they do not tell the whole story, for upon reflection it will be seen that without these reductions in cost a large proportion of the public now enjoying the benefits of light and power would be wholly deprived of the advantages which they now derive from your service. The remainder of the public which would still be carried on your books as customers, could not afford to use the electric current in such large quantities as they now do, and to employ it in such a great variety of useful and profitable ways.

The slowing down of the industrial and other activities of the country which would have resulted from such a curtailment in electric service, would connote an economic loss which it is impossible to state in pecuniary terms. Whatever it may be, the sum which represents the debt of society to your industrial scientific laboratories must be so large as to be almost incredible.

Appraising the Value of Research

In endeavoring to appraise the value to the public of research in applied science conducted by your industry, I have employed a method which I have used in estimating in pecuniary terms the value to the public of applied science in the telephone art. On previous occasions I have given the results of these estimates so that at this time I will only say that there, likewise, I have found that as a result of the scientific researches in the company laboratories, sums of money similarly great have been saved to the telephone users, while the service has been constantly improved and extended into every section of our country, and across the ocean, even now rapidly bringing the nations of the earth into speaking communication with each other.

Let me pause for a moment to mention the name of Alexander Graham Bell, the inventor of the telephone. It is only a few years since he passed away. If he were still alive, we can feel sure that he would be here upon this occasion to pay tribute to his friend and fellow-citizen Thomas A. Edison, the inventor of the incandescent light, who is also the inventor of the carbon telephone transmitter and the inventor of the phonograph. This unites his name in an especial manner with that of Bell. The one revealed the method of transmitting the human voice through the vastness of space, and the other, through the ages of time. As a long-time friend of Mr. Edison, and as one who so greatly admires his genius, I wish that I could adequately express my appreciation of his achievements. This I could hope to do if I could speak in the eloquent language that Bell himself would use. But it is not within my power to put in words the message which one of these immortals would give to the other. It gives me great satisfaction to be able to join with so many millions of others in honoring Mr. Edison and adding to theirs my own congratulations and felicitations.

The scientific industrial research conducted in your laboratories is often called "research in applied science." Applied science must submit its findings to the criterion of utility. It must produce practical results, things that can be used with advantage, perform new services, or bring about new economies. It must continue to pay for itself and yield a profit. Otherwise it must cease. The figures which I have presented and the evidence which I have submitted, abundantly prove the extraordinary value of the researches conducted in your laboratories. Your applied science does pay for itself, and more. Your industry could not exist without it. You cannot allow it to cease, and you will continue to prosecute it with ever-increasing success.

Extending Boundaries of Knowledge

But I have already said so much and there is so much more that could be said, showing the importance of scientific research conducted for the sake of utility and economy, that there is danger of losing sight of another form of scientific research which has for its primary object neither of these things. I refer to scientific research conducted purely for the sake of extending the boundaries of knowledge, discovering the laws by which nature operates, and determining the principles of mathematics, astronomy, biology, chemistry, and physics.

Pure scientific research is conducted with a philosophic purpose, for the discovery of truth and for the advancement of learning. Investigators in pure science may be likened to explorers who discover new continents or islands, or hitherto unknown territory. They are continually seeking to push forward the frontiers of knowledge. Their work is conducted without any utilitarian motive, for, as Huxley says, "that which stirs their pulses is the love of knowledge and the joy of discovery of the causes of things . . . the supreme delight of extending the realm of law and order ever farther toward the unattainable goals of the infinitely great and the infinitely small, between which our little race of life is run."

The Advance Guard of Civilization

The pure scientists are the advance guard of civilization. By their discoveries they furnish to the engineer and the industrial chemist and the other applied scientists the raw materials to be elaborated into manifold agencies for the amelioration of the condition of mankind.

Let me illustrate this by the work of Scheele, a Swedish scientist, who, in 1781, made a fundamental discovery respecting tungstic acid. He furnishes a classic example of the motive and achievements of the investigator in pure science. Aside from his pioneer work in tungsten, independently of Priestley he discovered oxygen. He also discovered manganese, chlorine, barium, and molybdenum. Truth, not utility, was his criterion, for in one of his letters he said: "It is the truth alone that we desire to know, and, oh, what joy there is in discovering it!"

Subtract from our present stock of scientific knowledge the body of truth which he contributed, and applied science as we now know it would be dwarfed, and it is impossible to imagine what would be the backward state of the industries based upon it.

Growing out of the discoveries of Scheele and inspired by his example, two of his pupils, the brothers d'Elhuyar, were the first to isolate and produce metallic tungsten. Were it not for the knowledge gained by these researches in pure science, the very existence of tungsten would be unknown. The tungsten filament lamp would be an impossibility, and the manifold benefits and economies which the public now enjoys as a result of its use, would not be realized. As to the effect of this upon your own industry, you yourselves can make the best conjecture.

Let me give some other examples of the results which have ultimately followed from scientific researches conducted only for the purpose of discovering new truths or principles.

In the early part of the last century, Hans Christian Oersted, Professor of Natural Philosophy at the University of Copenhagen, made the great discovery that an electric current flowing in a wire could move a magnet; and less than one hundred years ago, Michael Faraday, conducting researches at the Royal Institution in London, discovered that a moving magnet could generate a current of electricity, and that one current could generate another. Joseph Henry, a Princeton professor, and later Secretary of the Smithsonian Institution, independently of Faraday, discovered the laws of current induction. He also made other fundamental contributions to our present stock of scientific knowledge.

This list could be extended at very great length, giving the names of thousands of investigators in the domain of pure science who have contributed knowledge which is indispensable to modern industry and to applied science in all of its branches.

"Knowledge Is Power"

But let us consider the incalculable benefits which the whole world has derived from the knowledge of scientific principles and laws contributed by only three of these great men—Oersted, Faraday, and Henry. If we did not have this knowledge, the electric telegraph and the electric light would be unknown; neither Bell nor anyone else could have invented the telephone; there would be neither dynamo nor motor, and your industry would never even have been thought of; your association would not exist, and we would not at this time be celebrating the great achievement of Edison in the invention of the electric lamp.

I have stated in terms of money some of the debt which we owe to your own workers in applied science, but it would tax the powers of the human mind to estimate the prodigious sums which have been added to the wealth of nations by the contributions of the investigators in the field of pure science seeking only to discover the truth.

Further Fundamental Discoveries Awaited

I have spoken of the past, and now let me speak of the future. There are countless practical problems now confronting mankind which never can be solved by the applied scientist in the present state of scientific knowledge. He must await further fundamental discoveries and new scientific generalizations yet to be furnished by the investigator in pure science. Unless the work of the pure scientist is continued and pushed forward with ever-increasing energy, the achievements of the industrial scientist, in the course of time will become more and more restricted. Already the applied scientists have perfected your dynamos and motors and transformers, so that they are working at 95 per cent of their theoretically perfect efficiency.

While without any increase in our present stock of knowledge in the realm of pure science, the applied scientists would find abundance of profitable work to do, nevertheless, in the long run, they can proceed no faster than the discoveries of pure science permit. It is of the greatest practical importance, therefore, that we should do everything in our power to encourage and support the work of the pure scientists who are to be found in all of our universities and scientific institutions. The discoveries made by these learned men have no immediate practical value, and could not, therefore, bring to them or to their institutions, any pecuniary return. Unlike applied science, pure science cannot support itself. It must depend upon contributions of money from the public, from far-sighted patriotic citizens and men of affairs; from business and commerce and the industries which derive their prosperity or very existence from this field of human endeavor.

The Possibilities of the Future

The possibilities of research in pure science are boundless, because the resources of nature are without number. Great as are the scientific accomplishments of our day, they are small compared to the possibilities of the future. Two centuries ago, Sir Isaac Newton, the discoverer of the law of gravitation, who ranks perhaps as the foremost scientist the world has ever known, expressed his faith in the infinite possibilities of science in these words: "I seem to have been only like a boy playing on the seashore, and diverting myself in now and then finding a smoother pebble or a prettier shell than ordinary, whilst the great ocean of truth lay all undiscovered before me."

The scientific developments since the time of Newton so strikingly confirm this vision of the great philosopher that we can feel certain that, if pure science is properly supported, the discoveries of the future will be enormously great in comparison to those which have already been made. Future generations of Americans may look upon us with our present limited knowledge of the forces of nature, as we now regard the American Indian, who, cold and shivering in his scanty clothing, was ignorant of the coal at his feet, with its stores of heat and power.

Now Attacking Most Fundamental Problem

Although seriously hampered and restricted by the lack of funds, American investigators in pure science are pushing forward their work with courage and determination. Among the thousands of problems which occupy their attention, they are attacking the most fundamental of all—the ultimate constitution of matter, the structure of the atom, and the nature of the electron. On the summit of Mount Wilson, in California, the astronomers are observing in the sun and in the stars and in the nebulæ, not only worlds in process of evolution, but what is most astonishing, the evolution of the chemical elements themselves. In laboratories at the base of the mountain, chemists and physicists are attempting to reproduce with increasing prospects of success, conditions which have been discovered in the depths of the universe. They are splitting the atom into its parts, and their work is filled with the greatest promise. From it I believe science will some day learn how to take the elements apart, and put them together again in new and most remarkable combinations. Already they have found that in the depths of space, hydrogen is being transmuted into helium, oxygen, silicon, and iron. They have discovered that the material substance of the faint companion star of Sirius has a density of one ton per cubic inch; while a cubic inch of the material composing another faint star recently studied at Mount Wilson may weigh as much as seven tons.

I believe that in the course of time, if these investigations can be carried forward to success, our applied scientists will be able to provide new structural materials and metallic alloys, lighter or heavier, as may be desired, cheaper and more durable and capable of resisting corrosion. Researches such as these should be multiplied a thousandfold. They will give us the answer to the great problem of drawing upon new sources of energy, and of utilizing those already available with the highest economy and efficiency. No inquiries could go more deeply to the foundations of industrial progress than these, and none could hold forth such promise of continued prosperity and of such advancement in all human affairs.

If there were time to do so I could show the necessity for conducting pure science research not only in those fields which I have already indicated, but I could explain why it is essential to prosecute such researches with the utmost vigor, in every department of science without any exception whatever.

Measuring the Value of Science

Because it was convenient, I have stated some of the results of science in terms of money. But the value of science can best be measured in terms of human achievement, the mastery of the forces of Nature, the elimination of poverty and disease, the prolongation of life, the advancement of learning, the growth of right living and sound thinking and of good understanding among men. Pure science research is indispensable to the attainment of all of these ends. According to the present vision of science, life must no longer be regarded as a struggle among men for a limited store, where one man's gain or one nation's gain must be another's loss. Under the banner of science, we are asked to join with our fellow-men working together in controlling and utilizing the bountiful forces of nature.

"Science," said Pasteur, "is the soul of prosperity of nations and the living source of all progress." American business and commerce and industry and the whole of the American public are being asked to give and to continue to give to pure science research, in our universities and elsewhere, that support which it so greatly needs. For all the benefits which it is conferring upon us, science asks only that we provide its zealous workers with an opportunity to multiply their efforts in our behalf. Upon the answer to this call depends the future prosperity of the nation. (Applause).

Chairman Owens: I feel sure you will agree with me that no more scholarly address has ever been presented at the National Electric Light Association Convention.

Mr. Carty, we are indebted for a great contribution to this industry, and to the nation and to the world, in this address.

Again I want to call your attention to the fact that the convention, except for the introduction of the Benn talk, would have been run exactly on schedule.

I will ask Mr. Mitchell if he will now make the announcement which I am sure will be of very great interest to you. Mr. Sidney Mitchell:

INTRODUCTION OF FOREIGN VISITORS

By SIDNEY Z. MITCHELL,
President, Electric Bond & Share Company.

We are accustomed to think in an intense way, of the great electrical developments that are being made in this country for our own benefit, and also for the benefit of the world. I doubt if we realize to what extent the remainder of the world is also thinking of practically the same things that so greatly absorb our thoughts here.

It has been my privilege to investigate electrical developments very generally throughout the world in the last two or three years. While I have found, as you all know, that in most respects, the developments in the foreign countries are perhaps not pushed ahead in a general sense as far as in this country, yet in some respects, they are even better. In many ways they can teach us a number of things that are useful for us to know. The greater portion of the foreign countries are taking their cue now as to the commercial developments from the United States, because they found upon investigation that we have intensified and pushed and refined the commercial side of the business in a way in this country that cannot be found anywhere else.

You know that some of the countries that are being developed electrically in an intense way today are 7000 miles from us. That is rather far for the transmission of power or for the interchanges of power, but, it is not at all too far for interchange of ideas and of good-fellowship. I think that is shown by the fact that at this convention we have by far a larger number of important men from foreign countries who are here to extend the hand of fellowship to us, and to exchange ideas with us, than ever before.

Another thing that brings them here is the fact that they all recognize, as we do, that Mr. Edison has been the real, great Father of the Electric Light Industry, and they have come here to join us in doing him honor by helping us celebrate the Fiftieth Birthday of the Incandescent Lamp.

Looking around the room I have been able to find only a few of these foreign friends at the moment, but they are very important ones. They have been enjoying the pleasure of interchanging ideas with you gentlemen, and seeing you, and I know you would enjoy the pleasure of seeing them in a more or less individualized capacity. Therefore, I have asked them to kindly consent to come on the stand in order that I may present them to you one by one.

Visitors from Japan

The first gentleman whom I am going to present to you is the "C. A. Coffin" and "Owen D. Young" king of electricity in Japan. He is the president of the great Toho Electric Power Co. and a director of the Tokyo Electric Light Co. He is also the president of the Japan Electric Bond & Share Co., a man who is known not only throughout the Orient, but throughout the world to everyone who is cognizant of electrical conditions in Japan and knows who is who over there. Gentlemen, I have the great pleasure of presenting to you Mr. Yasuzaemon Matsunaga. (Applause).

While I am talking to you about this doer of things, this great leader of the Flowery Kingdom of Japan, the land of the cherry blossoms and many other beautiful things, I want to also present his right hand man in the doings of so many worthwhile things. Let me present Dr. Tadao Kamiya. (Applause). In this country he would correspond with what we would call the first lieutenant of this great doer of things.

You know, we have had a great many people from foreign countries who have come here and become Americanized. I doubt if you know how many people go to Japan and fall in love with the country and become Japanized. There are numerous learned and very able men of that type, some Americans and some British. We happen to have one here of British origin, yet who is now a citizen of Tokyo. I want to introduce to you the general manager of the Nippon Denki Shoken Kabushiki Kaisha, Mr. H. A. Chapman, also of Sales & Co., London. You see I have been practicing on this name (laughter) because in English it means Japanese Electric Bond & Share Co. I wish I could know as much as 1 per cent of what he knows of the Orient. I might be helpful then in promoting better trade relations with our country.

Latin-American Visitors

I am going to move over about 7000 miles in another direction. We have representatives here from many Latin-American countries. Unfortunately, in the short time at my disposal I could only find a few of them. Yet, as I said before, they are the leaders in the electrical industry of their particular countries. Here is one of them particularly I would like to introduce to you. He is one of the pioneers of the great sister Republic of Argentina, a country, as our American Ambassador told us the other day, which has a cash circulating medium—this is going to astonish you—of from 40 to 50 per cent more per capita than the United States. I think that will surprise many people. This gentleman was good enough to let us come in as partners in a small way in Argentina with him. He controls down there about 120 towns and cities. The business is growing 20 to 25 per cent a year. His country sells corn and hogs, beef, wheat and things of that kind; in fact, it is the food storehouse for Europe.

Gentlemen, I have great pleasure in presenting to you Mr. Mauro Herlitzka of the Compania Anglo-Argentina de Electricidad of Buenos Aires, Argentine. (Applause).

Now I would like to present to you another gentleman who, I think, was born in this country but who is now Brazilian. He has been very helpful in bridging over the differences in language and in customs for many American business houses in Brazil, including the one with which I happen to be connected. They love him in Brazil, and he is, like all other good people who know how to join any good country, much more Brazilian than if he had been born there.

I take great pleasure in presenting to you Illustrissimo Senhor Guilherme Haile of Rio de Janeiro. (Applause.)

We have some other sister Republic representatives here who came to help us do honor to Mr. Edison, and to exchange ideas with us, and from whom I have been learning many things. I would like to present now the eminent electrical man and lawyer as well, from Santiago, Chili, Dr. Samuel Claro (Applause).

I would also like to present to you the general manager of the Compania Chilena de Electricidad, Limitada, of Santiago, Chile, Mr. Harvey Diamond. This Chilean company was German up to the beginning of the war, and then became British. It has just joined our American and Foreign group in the last few months, and the gentlemen who are here representing this Chilean company are part of the Lord Cowdray staff of the British ownership.

I am now going to present a young man who has a star reputation; in fact, he carries the flag of honor for being the greatest commercial developer, the greatest salesman of appliances, in pushing for business, that I know in the Latin countries. He is the commercial manager of the Empresa Guatemalteca de Electricidad, of Guatemala City. Gentlemen, Mr. Carlos Dorion, from Guatemala City. (Applause.)

In conclusion, I would like to say that the Association wishes to tender to our foreign delegates a luncheon at 1 o'clock in the Blue Room of the Hotel Shelburne, and I would like to ask all the foreign delegates present, and all you can find, to leave their names and the names of their companies, at the executive offices of the Association. All the foreign delegates are invited, and we hope we will have 100 per cent attendance at this luncheon tomorrow, at 1 o'clock.

[The meeting adjourned at 1:30 p. m.]

THIRD GENERAL SESSION

THURSDAY, JUNE 6, 1929

[The meeting convened at 10 a.m., President Arkwright presiding.]

PRESIDENT ARKWRIGHT: The meeting will please come to order.

The first item on the program is the announcement of the Prize Awards by the Committee. Mr. W. H. Onken, Jr., Chairman of the Committee, will make the announcement.

REPORT OF PRIZE AWARDS COMMITTEE

By W. H. ONKEN, JR., *Chairman*

(For Committee Personnel See Appendix 4)

Through the generosity of their respective donors, the Prize Awards Committee has made the following awards for 1929.

The titles of the winning papers and their authors are as follows:

HENRY L. DOHERTY GOLD MEDAL

"Investment Merit of the Electric Utility Industry," by Everett W. Vilett, Public Service Electric & Gas Co., Newark, N. J.

HARRIET BILLINGS AWARD

"The Human Side of a Balance Sheet," by P. O. Johnson, Northern States Co., Minneapolis, Minn.

MARTIN J. INSULL AWARD

"A Public Relations Yardstick," by Rob Roy MacLeod, Buffalo, Niagara & Eastern Power Corp., Buffalo, N. Y.

J. E. DAVIDSON AWARDS

1. "A Study of Merchandise Advertising," by Keo Currie and Ray Warren, Public Service Co. of Northern Illinois, Chicago, Ill.
2. "Specialized Merchandising for the Central Station," by Donald D. Parry, Central Hudson Gas & Electric Corp., Poughkeepsie, N. Y.
3. "Winter Humidity and Comfortable Homes," by Edwin Fleischmann, Niagara Falls Power Co., Niagara Falls, N. Y.

JAMES H. McGRAW AWARDS

1. "Operating a Hydro-electric System for Best Economy," by E. B. Strowger, Niagara Falls Power Co., Niagara Falls, N. Y.
2. "The Electric Water Heater," by H. George D. Nutting, Detroit Edison Co.
3. "Peak Load in Steam Plants and Its Economical Generation," by Francis Heisler, Public Service Co. of Northern Illinois, Chicago, Ill.

H. M. BYLLESBY AWARDS

1. "Six Words in an Accountant's Life," by William A. O'Neill, Electric Bond & Share Co., New York, N. Y.
2. "How to Increase the Usefulness of the Accountant in the Public Utility Industry," by F. L. Barry, Electric Bond & Share Co., New York, N. Y.
3. "The Accountant in the Public Utility Industry," by Harold V. Bright, Southeastern Power & Light Co., New York, N. Y.

FRANK W. SMITH EDUCATIONAL AWARD

Raymond H. Young, Public Service Electric & Gas Co., Camden, N. J.

PRESIDENT ARKWRIGHT: I wish to announce you will find on sale downstairs in the special booth near the registration desk, the special Edison Stamps. They were put on sale for the first time yesterday at Menlo Park. That was immediately followed by placing them on sale here. I am sure everyone will want to get them and use them.

Mr. N. H. Boynton, for the Committee, will announce the plan for Light's Golden Jubilee. Mr. Boynton!

PLANS FOR LIGHT'S GOLDEN JUBILEE

BY N. H. BOYNTON

President Arkwright has asked me to discuss very briefly with you the plans for Light's Golden Jubilee. Light's Golden Jubilee had its inception, as you all know, with the Edison Pioneers at their annual meeting at Hotel Astor on Thomas Edison's birthday, February 11. And when the Pioneers called into being a great Sponsoring Committee headed by our President, Herbert Hoover, Light's Golden Jubilee became a nation-wide celebration, in which the electrical industry was a small but important part. Today we face the celebration of the Fiftieth Anniversary of the invention of the incandescent lamp and the establishment of the electrical industry with a great epoch-making event in which we all are eager to participate.

I want to read to you what our Chief Executive, the Honorable Herbert Hoover, said in accepting the Honorary Chairmanship of Light's Golden Jubilee Committee, because this will form the keynote for your thought and action in celebrating the event. In accepting the Honorary Chairmanship, for Light's Golden Jubilee, Herbert Hoover said to President Barstow of the Edison Pioneers:

"I shall be delighted to act in any capacity that will be a genuine tribute to Mr. Edison's services."

With that thought in mind, your Industry Committee has already carried out a great many plans.

Early in the planning for Light's Golden Jubilee, we realized that Thomas Alva Edison is still with us in the flesh, and very much in the spirit; that we could pay a very handsome tribute to a very wonderful man, a man to whom we, the electrical industry, owe our origin. So those of us who were giving this occasion some thought were inspired to go ahead with our plans entirely on the basis of paying a fitting tribute to a grand man. As our ideas developed and as we gave the tribute more thought, we realized that while it would be fine to pay this handsome tribute to Thomas Edison, still it should not be our sole objective. An even grander thought captured our imaginations, and that was simply this: The character of the American youth is very definitely influenced by the heroes at whose shrines the American youth is wont to worship. The Washingtons. The Lincolns. The Lees. These grand characters of American history go to make up the character of the American youth.

The Object to Be Advanced

In Thomas Edison we must realize that we have another national character, a character which has been made not through the ballot box, not through military genius, not through the fortunes of war or politics, but through the energy exerted at the work bench, through the energy and untiring patience and diligence that has come out of constant research work. So through Light's Golden Jubilee I believe we will find that we are canonizing another great character, that of Thomas Edison, the epitome of hard work and perseverance, the man who coined the phrase "genius is one per cent inspiration and 99 per cent perspiration."

So I believe that as you think more and more of the celebration of Light's Golden Jubilee you will come to realize that this grander thought to which I refer is the great object to be advanced through this celebration.

The organization of the movement is a very simple one. The Edison Pioneers, through a subcommittee, have called into being a great Sponsoring Committee which, as I have already told you, is headed by the President of the United States. That Committee consists of some sixty men and women from all sections of American life, none of them associated with the electrical industry directly, and these people are enthusiastic in their efforts to properly guide the future course of Light's Golden Jubilee. The Edison Pioneers have also called into being an Industry Committee. Many of you are serving on that Committee.

Beyond that, there is no organization—and it requires no organization, because this celebration will come from the heart. Does one need to be told how to celebrate Christmas, or the New Year, or Fourth of July? One just celebrates. Who then is there who needs to be told how to celebrate this glorious fiftieth anniversary of the electric light. Furthermore, as you get the leading men in your community interested in the subject they will have as many, if not more, ideas on how to celebrate than any committee could bring to them.

Plan Book Prepared

To assist in this work the National Electric Light Association has prepared a Plan Book. Limited copies are available today and will be sent to you upon your return to your homes. Plan Books can be had at any of the booths of the lamp companies, the Westinghouse, the Edison, or the National Lamp companies today, and at those several booths are men who have given a great deal of thought to this general subject and who will be glad to discuss the matter with any of you.

Briefly, the plan should be developed, we believe, along these lines. You will find a great interest on the part of the business community in your cities. Therefore, it seems best to organize locally with the leaders of business in your community. As the head of Light's Golden Jubilee Sponsoring Committee in your city, you may be sure to find the leading local man or woman intensely interested in the Jubilee.

The greatest respect that we can pay to Mr. Edison is to have him realize that the American public, the world public, if you will, appreciates the great effort that he has put forth and the many priceless gifts that he has bestowed upon us. That is really the great reward for service—the knowledge of good rendering.

You will find when you begin to organize in your community that everyone knows of the great invention that was made fifty years ago, knows of the great Age of Progress, which it engendered. You will also have means at your command to let them know. The best thing that you can do is to organize all your local service clubs, Rotary, Kiwanis, Chamber of Commerce, and the like.

The Local Program

Set aside a program in which Mr. Edison and his great achievement can be discussed, presented probably by a member of your own company, or by someone made available to you by the Speaker's Bureau of Light's Golden Jubilee. See that every luncheon club, every business club, every church, every school and every lodge, pays its respects to this great leader of ours. Each will be anxious to do so.

Beyond that, the program can be whatever your local community desires, In Atlantic City you have seen the great Festival of Light, a glorious display of light on the boardwalk; on Atlantic and Pacific Avenues; and, many of the side streets and hotels are paying their respect and tribute to Thomas Edison on this occasion, for this week has seen the beginning of Light's Golden Jubilee here in Atlantic City. Not many cities will want to go as far as Atlantic City has gone in this direction, but many of them will want to do some special festival lighting in their own way. They will want to have many public gatherings where Mr. Edison receives the tribute of the people. Whatever direction the local plans take, you will be on the right road to a successful celebration, because the citizenry will be paying respect to our great founder.

So I urge you to get a copy of the Plan Book which will explain in detail what may be done. I urge you to act early. I urge you to select from the business organizations in your town the leaders to sponsor the celebration in your particular community, and work up to a great climax on October 21, this fall, which is the fiftieth anniversary day of the perfection of the incandescent electric lamp by Mr. Edison. This day, I believe, will be a red letter day not only in the electrical industry but in the history of the United States, because I believe there will be by far the greatest outpouring of gratitude to Mr. Edison on that night that has ever been paid to any one individual.

When History Repeats Itself

An outstanding feature of that evening's program will take place at Dearborn, where our distinguished Edison Pioneer, Henry Ford, has caused Menlo Park to live again, just as it was fifty years ago. And there in the company of a few of the Edison Pioneers, and a few of Mr. Ford's personal friends, will be re-enacted, in the old, original laboratory, the scene of fifty years ago. Mr. Edison will actually make the incandescent lamp as he made it October 21, 1879, and Graham MacNamee will tell the world, over the radio, about the scene that is being enacted there. Mr. Edison will work in the light of the old kerosene lamp, as he did in his laboratory fifty years ago. You and I on that night will be sitting at home with our families, in the light of the kerosene lamp or candle, and we will be listening to the description over the radio of this great occasion.

Then as Mr. Edison completes the lamp and goes to the old engines which have been retrieved and reconditioned by Mr. Ford, and as he lets the steam from the old rejuvenated Wilcox boiler, fired as it was fifty years ago, into this old engine, and as the engine starts to boil, and the voltage builds up, the lamp will be re-born. The light will come on feebly at first; then it will grow brighter, and finally as it comes to full voltage and full brilliance, lights all over the world will be turned on in glowing tribute to this great inventor.

The occasion will be a grand one. I think we will all be glad to be a part of it. We owe it to our communities to see that they appreciate the wonderful benefits that have come through Mr. Edison's great invention, and that October 21, 1929, will go down in the history of the electrical industry and of the world as a red letter day.

And so I urge you, with these few brief remarks, to be active in your community. See that you have a plan that will embrace the entire public within your community; and see that no one shall fail to realize that this is the golden anniversary of a great invention. If you do this, then a rose to the living, to our Mr. Edison, our great hero, will be tendered. We should all be eager to take a part in this great movement. (Applause.)

PRESIDENT ARKWRIGHT: It is a privilege to have the distinction and honor for the National Electric Light Association to inaugurate Light's Golden Jubilee in celebration of the first successful demonstration of the electric incandescent lamp, invented by Mr. Edison on Oct. 21, 1879. With its coming, the terrors of dark were banished; useful time was lengthened; available space was widened; efficiency was increased; safety was increased; quality of production was better; quantity of production was increased; earnings of men were enlarged. Living conditions were made better; convenience, comfort, happiness and joy of mankind were increased. It is the cheapest light the world has ever had, a hundred times cheaper than candle light; many times cheaper than oil light. Indeed, it can be demonstrated that it is cheaper than daylight, and it is better than daylight, too. As important as the lamp was, the idea of the lamp in Mr. Edison's brain, or the experimental model in his laboratory would have served no useful purpose. It was necessary to bring it into service of mankind, and Mr. Edison thereupon developed the central station, machinery, appliances, methods and plans. Not only did he develop the plan of it, but he established it with courage and far-sightedness and risk and devotion. He couldn't do that very well all by himself, and he gathered around him a band of devoted men, industrious and intelligent, standing close to him, working along with him, aiding him to develop and bring to mankind the invention of his brain.

Not only do we honor Mr. Edison today, but those pioneers who served with him, not perhaps taking the greatest credit to themselves, but as useful, as necessary as even he himself was.

We are very proud of the fact that a number of them sit before us in the middle section. Everything, every circumstance surrounding this inaugural is so favorable, the fine, new auditorium with this display of what electric incandescent lighting can be, even the sun has shined brightly all the week. The skies themselves seem to smile upon the occasion as in evidence of the favor of heaven, of the bringing forth of so useful an invention and so useful a service for the happiness, joy and comfort of mankind.

It seems especially propitious to me that all week long we have the clear, bright sunshine when through the year clouds of suspicion seemed to have been blown upon the industry that Mr. Edison founded. It looks almost as if the One who searches men's hearts and knows all has confidence in our integrity of purpose and believes that we are trying our very best to do a useful service. As the clouds have disappeared in the bright sunshine of our week's convention, so it seems that with the truth of light the clouds of suspicion on our industry would be swept away also.

We couldn't have this inaugural ceremony this morning just by those of us who followed in the footsteps of those who founded and made the industry. We call to our aid those great Edison pioneers, so that greater honor may be given those men who in the pioneer days couldn't possibly foresee what it could be, but with the vision and belief almost of what it has become, went into it and built it up. We have had as an advisory committee for this morning's exercise, Mr. John W. Lieb, Mr. C. L. Edgar, Mr. Samuel Insull and Mr. S. Z. Mitchell, who sponsor this particular session of our convention.

Among them we have asked to preside as honorary chairman the first electrician, the first engineer of a central station that ever the world had known, with no past experience, with no facts demonstrated by actual experience as to what to do. He had to start out on a course uncharted, developing through his own mind and his own devotion and his own intelligence how best that light could be brought to people, and the ideas of Mr. Edison's genius and the central station, worked out through his mind and his efforts, could be made to usefully, satisfactorily, adequately and dependably serve mankind.

It is a great honor to have with us as Honorary Chairman, Mr. John W. Lieb, and it gives me very great pleasure and I take very great pride in presenting to you as Chairman of this session, Mr. John W. Lieb. (Applause).

[Mr. Lieb assumed the Chair.]

CHAIRMAN LIEB: Mr. President, Edison Pioneers, Ladies and Gentlemen: In giving expression to our admiration of the accomplishments of Mr. Edison by eloquent tributes of praise expressed in addresses and also visually as manifested in these glorious illuminations celebrating the Golden Jubilee of the incandescent lamp, we should not fail to signify our appreciation, however lightly, of his many accomplishments in the other fields of applied science in which he achieved wonders no less marvelous and appealing.

We justly celebrate the convenience and comfort the world enjoys and the triumph over drudgery and labor that has been accomplished through the innumerable applications of light and power service. We must not forget, however, that a wide field has been opened to mankind for the utilization of the leisure hours thus made available and enjoyment of the happiness thus acquired through other manifestations of Mr. Edison's genius.

In that wonderful and genuinely original apparatus, the phonograph, in his pioneer work in the development of the moving picture, the foundation of a vast industry catering to the pleasure and enjoyment of people in every nation and in every clime, and in his contributions to the transmission of intelligence culminating in the carbon transmitter, we have disclosed vast fields of progress in which pleasure and joy are brought to our homes, all of these being incidental to the development of the electric light and power service.

The hours of play and recreation are no longer limited by the setting sun, but by economy of labor and improvements in the standards of living incidental to the extension of light and power service, we are enabled to enjoy a fuller life, wider opportunities for recreation and enjoyment.

It would seem appropriate that this convention send a message of felicitation and congratulation to Mr. Edison on this occasion, and a resolution is now offered which I beg leave, with the approval of the President, to submit to the convention for its consideration:

"Whereas this year marks the fiftieth anniversary of the invention of the practical incandescent lamp by Thomas Alva Edison; and

"Whereas, the electric incandescent lamp is the foundation upon which the magnificent superstructure of the electric light and power service has been reared to undreamt of heights; now, therefore, be it

"Resolved, by the National Electric Light Association in session at its annual convention in Atlantic City, N. J., by setting aside Thursday, June 8, as Edison Day in the celebration of the Golden Jubilee of the incandescent lamp, the Association acknowledges the everlasting debt of gratitude which it owes to the genius and indefatigable industry of Mr. Edison, whose inventive mind envisaged, not only the development of the incandescent lamp, but also a complete system of electric generation and distribution, necessary to bring the benefits of these and other epoch-making inventions of Mr. Edison to mankind, so that they have now become part of the heritage of the electric light and power industry. And be it further

"Resolved that the National Electric Light Association express to Mr. Edison its hearty congratulations and felicitations on this memorable occasion, rejoicing that it can pay him this homage and do him this honor while he is still in our midst, with his gracious helpmate ever at his side, and while he is still actively living his very full life, so replete with accomplishments, enriched with rewards, and enjoying the love and esteem of mankind. All of which constitutes a marvelous contribution to the happiness, convenience and comfort of civilization in which we are privileged to share. And in this Golden Jubilee Celebration we join all the world in heralding the genius and great accomplishments of Thomas Alva Edison."

Gentlemen, with the approval of President Arkwright, I take the liberty and have pleasure in offering these resolutions for your consideration, to be forwarded in a telegram to Mr. Edison at Fort Meyers, Fla.

All those in tavor of this resolution will signify by the usual sign. It is so ordered, and your mandate will be carefully carried out.

In the application of great inventions, the invention itself constitutes, of course, the great background on which the subsequently developed industry is built up. But it also needs the cooperation of many co-laborers, many workers in the shop and the field, to bring the benefits of a new invention as promptly as possible to the convenience of mankind. Mr. Edison had the good fortune, through a most lovable and engaging personality, to have surrounded himself with a group of enthusiastic workers who were always ready to follow in his footsteps in the lines of development which he indicated, sparing no time throughout the busy days and nights in carrying out his ideas and projects. So throughout the United States there grew up a considerable body of loyal, devoted disciples, with headquarters in our principal cities, who assisted in bringing to the public the benefits of these new developments.

We have the pleasure of having with us today representatives of this loyal band of workers from all over the United States, a band enlisted under the banner of the Edison Pioneers. They are assembled here in the center of the hall, and we extend to them a most hearty welcome. We are very glad indeed that they are here to join us in this celebration.

One of these early workers who played a very prominent part in assisting in the early application and development of Mr. Edison's enterprises is with us today, and it gives me very great pleasure at this time to present Mr. Charles L. Edgar, President of the Edison Electric Illuminating Co. of Boston, Past-President of the National Electric Light Association and a Past-President of the Edison Pioneers, to whom I turn over the meeting as your Chairman.

Ladies and Gentlemen, it gives me very great pleasure to present my very good friend, Mr. Charles L. Edgar, your permanent Chairman. (Applause).

[Mr. Edgar assumed the chair.]

THE INSPIRATION OF A NAME

By CHARLES L. EDGAR

President, Edison Electric Illuminating Company of Boston.

Our President has already announced that we have assembled here today to commemorate the invention of the incandescent lamp by Mr. Edison just one half century ago. There will be those who will stress the inestimable value of this invention and his meritorious work leading up to and succeeding its accomplishment, while others will be more inclined to consider the character of the man himself and discuss the individual rather than his achievements.

The pages of history are illuminated with the names of those who have attained renown through some distinguished service for the welfare of mankind. I shall classify these illustrious personages into two separate and distinct groups.

In the first group the much larger number devoted their individual efforts to a cause which was dear to the hearts of their fellowmen.

The Leaders of a Nation

Washington, the beloved Father of His Country, is a shining example of this type. He was called into service during a great national crisis which existed even before he responded to the summons. It may be said to his everlasting credit and honor that he carried out his task to a most successful conclusion. He found a struggling colony oppressed by the heel of a tyrant; he left a peaceful republic happy in its hard earned freedom.

Lincoln, the Great Emancipator, is another outstanding example of this type of famous men. He was called to preserve a nation. He not only threw off the shackles of the oppressed but he perpetuated a union which was threatened with disruption and disaster.

Throughout all times and in all nations of the world there have been numerous other examples of this devoted type. Many of these, as in the case of Washington and of Lincoln, dedicated themselves to the preservation and upbuilding of their country, while others were inspired to action not by love of country but through their consecration to religion. Contrast with these others who have used their talents in an attempt to break down and destroy civilization. These are the Cæsars and the Napoleons —warriors who have risen to fame as the conquerors of hostile nations, rulers who have reared vast empires to satisfy their ambition and lust for power. The former type working for the upbuilding of some lofty principle, and the later disrupting the order of the world to satisfy their selfish desires, have all obtained the plaudits of the multitude. In almost every case they had been working for a cause, whether it had for its object creation, preservation, or destruction.

It is most difficult to analyze the thrill and emotion with which we look back upon the achievements of these striking personalities to determine how much of it is due to their individual efforts and what part is the result of an interest in the cause which they represented. The two are so closely associated that unconsciously perhaps we have lost sight of the cause and have placed the individual upon the pedestal due to our fascination for the man himself.

The Individualists

The other group to which I refer includes those who have risen to fame through accomplishments which were the result of a thought or an idea originating in each inner consciousness. They were not called to preserve existing conditions, to introduce reforms, or to advance the interests of the church or state. They were pure individualists who assumed their tasks, not in response to a popular demand for a leader to accomplish some desired result, but inspired only by their own visions. They had a conviction that there was some specific object which they could accomplish and they carried their work to a successful conclusion without outside advice or assistance.

The poets, the philosophers, the painters, the musicians, and the scientists are all men of this type. They have delved into the minds of nature's mysteries and have brought to light gems of truth and beauty which have added to the wisdom and culture of the ages, but it remained for Edison to discover the source from which at his magic touch was created a new sun for a new world, dispelling darkness and bringing added comfort into the homes and revolutionizing the life and methods of a grateful world. For him nature revealed her hidden secrets and through him a new industry sprang into being. After centuries of unconscious waiting the world awoke to realize that the dark watches of the night had wasted away and a new day of light and gladness had dawned for mankind.

Edison, the Individual and Friend

I shall not attempt to recount the practical results which have followed this invention. I am leaving that as a theme for others. The thought which is uppermost in my mind has to do with Edison the individual and the friend, rather than with Edison, the inventor and the discoverer. There are many members of the Edison Pioneers scattered throughout this audience, and I feel that their thoughts are running parallel with mine, and that they will agree with me when I state that we are inspired not so much by what he has done as by what he really is. Those of us who have been closely associated with him and know him intimately, have received an inspiration which, though difficult to describe, is nevertheless profound and enduring. While we have been amazed at the volume of his achievements and spellbound by his energy and perseverance, we have been especially touched by the warmth of his affection. Though he may be acclaimed a leading scientist and inventor, though he may be pointed out as the highest type of American citizen, those of us who know him best will ever proclaim him, above all, a staunch and faithful friend.

A Life of Service

Always modest and of a retiring nature, he has not desired fame or honors, although his fellowmen have praised him for his integrity of character, have honored him for his achievements, and loved him for his self-sacrificing regard for others. Throughout his whole life no labor was too great to be undertaken for the accomplishment of a purpose when once his mind was determined to pursue it. Truly his life is a life of service, and we of the utility industry whose basic principle is service, find in his life and work an example which it is an honor to follow. When confronted with a problem the solution of which taxes our utmost powers, we may be encouraged to persevere when we remember how Edison conquered the apparently unattainable by dint of hard work, untiring zeal, and unlimited perseverance. While we credit Edison with a remarkable degree of genius, we have his own modest testimony that much that he has accomplished has been due to hard work and perseverance, and though we lack the natural powers which he possesses we may be inspired by his example to accomplish much in the world if we apply ourselves to the tasks which are ours with his determination and his willingness to labor.

To follow is the lot of the multitude; to lead is the privilege and responsibility of the master mind who dares to stand alone, if necessary, while adhering to the principles which he believes to be sound and logical.

Edison has blazed the trail through unknown wilds while others looked on with unbelief. His was the task to lead the way, and true to his high calling he emerged with the fruits of victory amid the plaudits of those who had been unbelievers.

Like Edison, our lives should be dedicated to the service of mankind, and I believe that like him we are endeavoring to meet our obligations with cheerfulness and earnestness and a desire to accomplish the greatest good to the largest number.

In looking back to review the wonderful results which he has accomplished during his fourscore years, we are again astounded that this man of mature years, but still young in mental capacity and in resourcefulness, has within very recent years taken up a new line of endeavor and we have every reason to believe is about to bring to a successful conclusion an important development in one of the leading commercial industries of our times. Apparently there is no limit to his possibilities, and we may confidently expect that as added years shall yield their opportunities he will continue to carry on for the good of humanity, and when those of us who know him intimately and are inspired by his personality shall have faded from memory, the name of Edison will still live and grow with the years, an inspiration to the sons and daughters of every tongue and every nation who see the light and render thanks to him who invented it.

Edison and His Associates

Speaking again, more especially to those members of the Edison Pioneers who are within sound of my voice, I desire to emphasize the personal relationship which has always existed between him and his associates. It was not my good fortune to be a member of the Menlo Park group. If I had been, I probably should feel even more strongly regarding the personal side of Mr. Edison's character. When one of his boys, as he delighted to call them, in later years made a success of his undertaking, the letter of congratulation signed personally by Thomas A. Edison, and the kindly spirit expressed in this letter has gone a long way toward making the recipient feel that after all life was well worth living.

If I may be pardoned a personal reminiscence, I would like to indicate more specifically why, like all the other Pioneers, I have a warm spot in my heart for him whom we affectionately call "The Old Man."

I still have a very distinct recollection of the first time that I saw Mr. Edison. As a junior at college I visited the laboratory at Menlo Park one summer afternoon and saw standing alongside a work bench three men arrayed in city attire. Sitting on the bench in overalls and swinging his feet was a young man who at first I thought was merely an incident in the picture. I rather took it for granted that these men had accidentally stopped to talk near where the young man was sitting. Someone nudged me and said, "That's Edison." Although I had not given him or his affairs any more thought than that of the ordinary college student, it was rather a surprise to me to see the relationship which apparently existed between him and the men who I afterward learned were his financial backers.

About forty-six years ago I called at his home in Menlo Park one morning while he was at breakfast. I had a letter of introduction from the Professor of Electricity of Rutgers University. I was shown into the parlor and told to wait. I could hear the conversation being carried on in the dining room, and after about half an hour began to wonder if I had been entirely forgotten. Just then Mr. Edison strolled into the parlor with his hands in his pockets and a cigar in his mouth, and said, "Where the dickens did you come from?"

I gave him my letter of introduction. He read it over and his only remark was, "Go down to 65 and see Charlie Clark and tell him I sent you." Somehow or other I realized that that was not the time or place to ask what "65" meant or who Charlie Clark was. I thanked him and walked out, and I am proud to say that from that day to this I have been connected with corporations which have borne his name. I think I am more proud of this than of any other honor which has come to me in my business career. There are undoubtedly many of you who are listening to me today who either do not appreciate or who underestimate what this means. All I can say is that I am sorry for what you have missed.

The Inspiration of a Name

While all of us engaged in the public utility business are proud of our industry and really feel and believe that it is one of the most important as well as interesting businesses in the world, I want you to realize that there are some of us, perhaps few in number, who have a deeper feeling than that felt by the greater majority. It is a feeling of pride, experienced not so much on account of what Mr. Edison himself has done as for what he has inspired us to do. I do not think that anyone could have been associated with him for a generation and not be influenced, perhaps unconsciously, by the spirit which has actuated him. It is hard to put into words just how we feel. Personally I feel like bowing my head and being thankful that my good fortune has enabled me to live my life in the atmosphere he has created and under the inspiration of his name. (Applause).

I appreciate very deeply being asked to substitute for Mr. Lieb. We all regret the necessity for this substitution. He is in all respects the logical man to preside at this notable occasion. His personal relationship with Mr. Edison and with Mr. Edison's family, make this substitution all the more regrettable.

The National Electric Light Association was organized in 1885, and held its first convention at Chicago in February of that year. It was apparently the first attempt to bring together those interested in the public utility business, and things did not go very smoothly when it came to the question of the organization of that association.

We have with us today one who was present at this convention and took a constructive part in starting this association on its right path. Those of you who were engaged in the arc light business in the early years will, of course, remember him by the arc lamp which bore his name. In later years some of you will think of him as the man who was identified with the wonderful work in connection with the gyroscope. He now holds the chief post of honor in one of the national engineering organizations. During all these years he has maintained his interest in Mr. Edison and his accomplishments. I have the honor of presenting to you the President of the American Society of Mechanical Engineers, Mr. Elmer A. Sperry. (Applause).

THE BIRTH OF THE INDUSTRY

By Elmer A. Sperry

President, The American Society of Mechanical Engineers.

It is certainly a great honor to me to be asked to speak here on Edison Day and to pay honor to our great leader, the Nestor of us all. I bring you greetings from the American Society of Mechanical Engineers, one of the world's largest technical bodies with its 49 years of useful service and its membership of some 19,000. The National Research Council also sends greetings through me.

I feel with Mr. Edgar that those of us who have known Mr. Edison longest love him most.

I never appreciated that I was a pioneer myself until recently, but it so happens that this is the fiftieth anniversary of my making my arc light and "dynamo," as it was then called, which was first publicly used to illuminate a Christmas festival in 1879 in Cortland, N. Y., my native town. (Applause). So I will do my best to give you a little picture as I have been asked to do, of the state of the lighting art at this early time.

There is no element of nature, no force existing in the world, that has been so surrounded with romance as has electricity. Even from the earliest time there has always been connected with the manifestations of electricity a romance that attached to no other of the forces of nature. Not even the grandest and most impressive manifestations of

Neptune ever succeeded in stirring men so deeply or striking terror to their souls as did the thunderbolts of the heavens. During the endless ages of the past they have left their impress on mankind and become synonymous with all that is marvelous, mysterious and majestic. Mere romance is at once accentuated and eclipsed. To the Greeks it became the center and symbol of the terrific irresistible vengeance of the gods. In more modern times all discoveries and observations regarding electricity have invariably commanded the attention of the civilized world and modern progress may be said to date from our beginning to comprehend the correlation between magnetism, electricity and motion.

When our own beloved Franklin was presented at the foreign courts, no small part of the acclaim given him came from the fact known the world over, that he had been experimenting with the identification of electricity and lightning.

Coming down later, since the days of our great Henry and his student worker Morse, we have known the electric current as generated by batteries and then its great service to telegraphy. When telegraphy was ushered in about 1840, great romance and great acclaim were again given it, and justly so.

Edison Enters the Electric Art

Then, as you know, Mr. Edison came into the electric art, such as it was at the time. How fortunate it was that electricity had attracted such a great master mind as that of Mr. Edison! He was one of the first to see the opportunity and grasp ways and means for greatly augmenting the usefulness of a single wire running from one city to another. The quadruplex and, finally, the multiplex, were means whereby he attained a very constructive knowledge of electricity and its uses.

When first it was discovered that light could be produced by electricity, then it was that the romance of electricity reached its highest pinnacle of universal interest and acclaim. This was accomplished by Sir Humphrey Davy in 1808. The arc was produced between two charcoal pencils from quite a large battery—a brilliant, beautiful, wonderful light. Davy, it should be remembered, was the teacher and great inspiration of Michael Farraday. All the text books in physics, "natural philosophy" as it was then called, immediately proclaimed the fact that electricity could produce light, and so surrounded it with glamorous embellishment that its thrill made a lasting impression on many a youth, as it did upon me and also on young C. F. Brush in Ohio, as he once told me. However, light was produced electrically, it instantly became a center of interest. People came miles to see electricity produce light.

The "Arc Light and Power Company"

Before 1879 we had a few stations operating arc lights. There was a boiler and an engine and a belt-driven "dynamo." I well remember the relief we obtained when we found we could use one belt over on top of another, placing the second generator a little farther away, and thus run four arc light generators from the two flywheels of a single engine. These stations were distributed in the smaller towns with larger ones in cities. The great Commonwealth Edison Company in Chicago started as the "Arc Light and Power Company"—you youngsters may not know that—with no less a personage than B. E. Sunny its general manager in those days, a prince of a young man who now is in control of the communications and telephone system of Chicago and was for a long time very active in this association.

When the arc light came it was a series system. You can quite well understand why it was a series system. All the uses of electricity up to that time, such as the electric telegraph, had essentially a series distribution. So we put one lamp after another in a single circuit and undertook to make both ends meet by placing these stations in the cities and soliciting custom and city lighting.

I was working out in Chicago, had built a factory, and when I was twenty-one started in to build our arc light system. Soon there were a great many arc light plants in use all over the Northwest and the West. The Thomson-Houston Company, the forerunners of the General Electric Company, operated on nothing else but arc lights at first. So, many arc lights were in operation by the winter of 1884.

Early Problems and Their Solution

There was another romance in electricity born about the same time as the first arc light system. The arc light had about a five-year lead on Mr. Edison's incandescent lamp, as you know. That romance was the telephone, another wonderful use for electricity. When the telephone commenced to be used, the switchboards were often in the kitchen of a house in a moderate-sized town. They were a struggling industry, as were our arc light systems. Just here a difficulty arose. The moment we started the arc light system at night, every telephone in town "went on the blink." They were all using ground circuits and it was that fact that brought the electric light people together and brought into being this great organization.

We held about three meetings, I believe, in the Grand Pacific Hotel in Chicago in the winter of 1884-85 to see if there wasn't some way in which this great conflict between the telephone companies and the operating arc light companies could be adjusted. They claimed that our arcs conflicted with their service, that they weren't of much account anyway, and they only ran at night and then sometimes went out. We claimed the telephones weren't of very much account, were altogether too sensitive, and couldn't be worked over a very great distance, and so forth.

As a consequence of these meetings there was appointed a committee of three men. I had at that time the largest and highest beacon that was then known, on the top of the Board of Trade tower some 303 ft. from the sidewalk. It was about

40,000 candle power, which had attracted quite some attention in and about Chicago.

The committee as named were Sperry, Chairman, Terry and Bowen. The second name is none other than the late lamented F. S. Terry, then a young man of my own age. He had always been an outstanding character, a man of great energy and foresight in the electric light industry and founder of Nela Park in Cleveland, the principal home of incandescent lamp progressive research. At that time Mr. Terry operated the largest electrical supply business in the United States, located in Chicago with branches in various other centers.

The third member of the committee, Mr. Bowen, was a tall, genial gentleman in middle life, who was trying to make both ends meet by the operation of a Vanderpool electric light system in the nearby city of Elgin, Ill. He was also connected with the printing business. A circular inviting the original conference of electric light station owners to assemble in Chicago in February, 1885, was drawn up by Mr. Terry and myself in my rooms in Chicago and forwarded to Mr. Bowen, who had promised to print and mail the circular gratis if we would compile it. When the circular came into our hands in final form we were astonished and somewhat alarmed to find on the cover of the four-page folder a cut of a large electric arc with its scintillating rays competing successfully with a faint half-moon, but that was the way it was sent out.

The Birth of the N. E. L. A.

To our utter surprise some 140 people responded, coming to the Grand Pacific Hotel in Chicago to represent different arc light stations all over the country, from Kansas City to the seaboard. The National Electric Light Association was born at that time. So there is one thing this great body owes to the arc light, and that is its existence. The arc light, however, was eclipsed gradually by the incandescent lamp for all uses but the most powerful and penetrating searchlights, projectors, etc.

One incident occured at this first meeting which proved the greatness of Theodore N. Vail. At that time he was the leader in the telephone business, a personal friend of our last speaker, Mr. Edgar, located in Boston—a great leader. At that meeting the electric light people sat with their sleeves rolled up, as it were, ready to assault anyone that remotely resembled a telephone man. We were hoping Mr. Vail would come himself, but he sent a delightful representative from Boston with a letter. This man got up and modestly read the letter and instantly we were completely disarmed. Mr. Vail went on to say, as I remember: "This matter of interference is our problem. We will work with you until we find some solution and you must do all you can to help and encourage us, but the burden is on us." Of course, we had not a word to say after that. The convention went on and achieved a number of standardizations, and also touched a great many useful points that were common to us all.

The other interesting incident connected with that early history is that General Carty, who is in attendance with us, then a young man working out of Boston on the telephone's side, completely solved the problem before the end of 1885. It seemed they had some very important customers from Boston on the way toward Providence, with whom we seriously interfered as soon as the electric lights were started at night. We see here that even in his youth Carty was running true to form, because in later life he has risen to world leadership in the realm of research, and I doubt if any one act of his in the line of research ever was of such transcendent importance or paid any greater dividends. In desperation young Carty twisted two wires together and eliminated the ground circuit, except for ringing. The problem was solved instantly. Of course the telephone interests at that time were making no money. They were struggling youngsters and they couldn't possibly consider *two* wires for *one* talk, but Carty showed them the way. It was gradually adopted and since that time the path has been wonderfully clear. Strange to say, this cycle of forty years or so has had to pass until this same problem comes prominently before you again.

Mr. Edison's 42-minute Speech

Referring to the great objective of the day, you understand Mr. Edison was a great leader in time of war. He served as head of the Naval Consulting Board. It was my honor to be associated with him in that work. Incidentally, we all have heard that Mr. Edison never made a speech. I remember well in 1893 at the World Electrical Congress banquet in Chicago he was given the choice as ultimatum and actually crawled under his table rather than rise and say a few words. Such is his natural modesty. But at the time I mention he sat and gave us a marvelous talk on his work, especially in connection with camouflaging ships and other most interesting experiments he had been trying, and he continued for forty-two minutes. Somebody timed him. So Mr. Edison has been known to make one other speech beside the one in the movietone to follow. This is quite contrary to popular belief.

As a body the Consulting Board has tried to resign several times, but we are told by the Navy Department that it will take an act of Congress to create another body, we are considered minute men and we must stand by. Mr. Edison has consented to stand by and, of course, we all stand with him, those of us that are left.

He invited some of the Board over a few weeks before he started for the South, previous to his eighty-second birthday. We hesitated to go because he was so busy, but we went, saying we would stay one hour. Six of us went over, and we were met by Mr. Edison in the library or office of his laboratory.

Mr. Edgar has given us all a beautiful picture of Edison, the youth in overalls, swinging his legs from a work-bench at Menlo Park. I want to draw a little picture of Mr. Edison at eighty-two.

When we came in, he spied me, with a cane. He said, "Sperry, what are you doing with that cane?"

I tried to explain that it was only a bad habit of mine that I had recently acquired. He said, "I have no use for a cane, now see me kick!" He jumped up out of his chair and kicked higher than his shoulder instantly.

Of course, we were all wonderfully amused and laughed, I believe I applauded. He said, "Well, if you laugh at that, I will give you something to laugh at. I was away on one of these here vacations." He didn't speak in very respectful terms of a vacation, although I cannot understand how he could resist his friend, Mr. Ford, who sits before you here. I think he was the one who teased him into having his first vacation. He said, "While on one of these here vacations, I kicked like that and Mr. Burbank tried to imitate me and he fell down on his back and hurt the back of his head. Ha! Ha! Ha!"

He laughed as though he were a boy of ten. We could all see that the picture of Burbank picking himself up out of the leaves, and rubbing the back of his head must have been very vivid in his mind as he recalled it because he laughed until the tears ran down his face and we shared in his merriment.

One little word and then I am through.

We noticed Mr. Edison does not walk. He runs. He said to me, "I have a wonderful photograph of Diesel." He asked his secretary, Mr. Meadowcroft, a youth of 76 who is also here with us, "Where is that photograph of Diesel." He commenced to run around the laboratory among his photographs trying to find the picture. Mr. Meadowcroft finally unearthed it. He took me by the sleeve and I could hardly keep up with him. He ran with such speed to where this photograph was and showed it to me. It was an unusually fine autographed photograph of Diesel.

Men Who Know Too Much

Later we went out about half a block in the rain, Mr. Edison without any hat, to a building where he was working on the seventeen thousandth series of plants. He had examined no less than 16,000. He showed us a plant yielding 9.6 per cent rubber, found in a canyon in Arizona. He took from his shelves in a back room notebook after notebook. There seemed to be at least forty of them, some of them in his own handwriting. They were the records of these plants. Full of activity, he said with all the charm of his whimsical smile, "I had to clear out my chemists from this laboratory; they knew too much. I had to get a fresh lot in, mostly youngsters."

You know he is very deaf and it is very difficult to communicate with him, but I made bold to tell him the only story that was told on the occasion, and with apologies to Mr. Ford I will repeat it to you.

I said, "That reminds me of the way your wonderful friend, Ford, works. When Mr. Ford started to think of going into the flax business he said to Mr. Mayo, 'You have a bright young man in your drafting room or among your engineers. Won't you bring him in to me?'

"This young man came. He was almost trembling before Mr. Ford. The latter said, 'Sit down.' He did, and Mr. Ford turned to him suddenly and said, 'Young man, what do you know about flax?'

"The young man said, 'Oh, I'm afraid, Mr. Ford, I don't know a dum thing about flax. I am very sorry.'

"Ford said, 'You're just the man we want.' "

Mr. Edison laughed about it and said it was just his experience with the rubber. He added, "Sometimes it is best to take on men who are unfamiliar with the job."

I am afraid I have taken too much of your time, but this gives you, all too inadequately, a glimpse of this marvelous worker, with all his most lovable, human traits not only preserved but accentuated and mellowed by the years.

I thank you. (Applause).

CHAIRMAN EDGAR: Some four or five years ago the Edison Pioneers sponsored a movement for the erection of a tablet to Mr. Edison, located upon the grounds of his old home in Menlo Park. This consisted, as most of you know, of a rough field stone with an appropriate bronze tablet, and was located alongside the Lincoln Highway, and also close to the tracks of the Pennsylvania Railroad. It is a notable landmark to those traveling between New York and Philadelphia.

Some months after its completion I received a letter written upon the letterhead of the Public Service Electric & Gas Company, suggesting that that company would like the privilege of permanently lighting this memorial at their own expense. This letter was signed by the gentleman that I am about to introduce to you. It was characteristic of the man and of his company, and I take great pleasure in presenting to you Mr. Thomas N. McCarter, the leading spirit in public service in New Jersey. (Applause).

FROM THE LAMP—THE ELECTRICAL INDUSTRY

By THOMAS N. MCCARTER

President, Public Service Electric and Gas Company, Newark, N. J.

Fame is indeed a peculiar thing. Some few years ago Mr. Edison did me the honor to call upon me in my office in Newark. I did not know he was coming and his arrival was announced by a precocious office boy who said to me, "There is an old man outside and he says his name is *Ecdison,* and he wants to see you. He looks like a book agent. Shall I let him in?"

I have only to add that contrary to what happens in the story book, this youthful protegée has not yet supplanted me as President of our company. (Laughter).

As a Jerseyman born, as a citizen, during all of my life of that great State and as an executive of a company which supplies the majority of its people with electric light and power, it is with feelings of particular pride and gratification that I participate in this celebration planned to mark the fiftieth anniversary of the discovery of the incandescent lamp, and to honor the great man whose genius, whose untiring effort and whose ability to translate theory into useful reality made it possible.

New Jersey's Most Illustrious Citizen

Because Thomas A. Edison has been a resident of the State during the period of his greatest scientific and inventive activity, we of New Jersey claim the great inventor as the most illustrious of our citizens, and as one group of New Jersey names—Trenton, Princeton, Monmouth, Morristown—calls to the minds of all Americans the memory of Washington and his heroic struggle for independence, so other New Jersey names will be forever associated with Mr. Edison and his many epoch-making inventions and discoveries.

In Newark he perfected his improvements in telegraphy, assisted in the production of the first successful typewriter and discovered the phenomena which later became the basis for the development of wireless telegraphy; in Menlo Park he produced the carbon telephone transmitter, including the microphone, the phonograph, the incandescent lamp, gave commercial possibility to the generation and distribution of electricity, and accomplished other wonders; in Harrison he established the first commercial electric lamp factory, and at West Orange, he gave to the world the motion picture camera, one of the best of storage batteries, and is still actively at work, mentally and physically capable of further discoveries and inventions.

And, so, speaking for New Jersey, I add the tribute of his fellow Jerseymen to that great volume of acclaim with which the people of the entire world mark this anniversary—not merely of an accomplishment but of a man.

At every recital of the inventions of Mr. Edison, I am astounded at the number of what are now great industries in the development of which those inventions played an important part. Telegraphy, telephony, wireless, radio, motion pictures, electric rail transportation, electric light and power, and so on through the long list, each has been stimulated, each has profited, each has been bettered by some product or products of his almost universal genius. When we consider the remarkable diversity, the remarkable quality and the remarkable quantity of his laboratory output, we can better understand why he has considered, that for himself at least, a 20-hour working day is not too long.

What the Industry Owes to Edison

We of the electric light and power industry owe to Mr. Edison much more than is involved in the discovery of a practical incandescent lamp, important as that discovery was. In my opinion we owe to him the very basis of our industry. He gave to us the first practical commercial central station, and he developed for us the first practical method of generating and distributing electrical energy. From the abstract he produced the concrete; from theory he educed practice; by the magic of his mentality he converted scientific speculation into practical accomplishment, and upon the foundation that he laid has been reared the great structure of an industry, that today plays so great a part in the economic and social life of this nation.

It was my good fortune in November of 1926 to act as Mr. Edison's guide on an inspection trip through the then recently opened Kearny generating station of our company. The plant represented as far as we could make it represent, the latest and best in the way of power station construction and equipment, and constituted part of an electric system that is essential to meet the needs of more than three million people.

"More Trouble Back in the 80's"

It was inevitable that as I stood by the side of Mr. Edison and listened to the humming of the giant generators, whose every pulsation sang a song of energy—of power, that I should in my own mind contrast this latter day development of electric practice with the beginnings of the industry for which my distinguished guest was responsible, and that Mr. Edison had made a similar mental comparison was evidenced when, as he was leaving the station, he remarked, "Marvelous! But we had a lot more trouble back in the Eighties than you have now."

There are those of us, perhaps, who will be inclined to disagree, with the second of Mr. Edison's statements, and who will not hesitate to assert that while the character of that trouble has changed, its volume has increased, but all of us will join with Mr. Edison and the rest of the world in his declaration that the development of the central station of which Kearny was a symbol has been indeed "marvelous."

The story of the growth and present greatness of the electrical industry has been told over and over again in statistics. Figures of investment, of output, of revenues, have, however, become so large that they have ceased to convey anything more than an impression of mere size, and so tend to detract from rather than add to that true perspective, which in fact represents its stature. The most important fact about it, is not that the comparatively few thousand dollars that went into the construction of the Pearl Street Station have grown into an investment throughout the country of more than ten billion dollars—it is that the development of electric service since that day in October of 1879, when Mr. Edison perfected his incandescent lamp, has brought added prosperity to American citizens, has revolutionized American industry and has increased immeasurably the comfort and convenience of American homes.

It is in terms of benefits conferred upon the people—not in terms of kilowatt hours and dollars

—that the astounding results of the discoveries and inventions of Mr. Edison and the many other scientists and engineers who have played their part in electrical development along with far-visioned financiers and executives, may best be recorded.

Wealth Created by the Industry

Even in the realm of statistics we draw too dim a picture, when we attempt to show what the industry has created in the way of wealth by a recital of figures showing investment in the industry alone. Vast as are these totals, they are small beside the figures of wealth which electrical service has built up for the nation in trade, in industry, in transportation, and in our other activities.

Electric service has helped to make our great cities possible—it has given them light and power without which their present character would have been impossible. It has provided for them rapid transit necessary to their existence, and it has changed for the better the habits of living of their people.

Electric service has played an outstanding part in the development of our suburban communities, giving to their inhabitants those comforts and conveniences which, added to their natural advantages, have attracted thousands to new and better conditions of existence.

Electric service extended to our rural communities is bringing to thousands of farms not only increased economy and efficiency in agricultural methods, but improved conditions in their domestic establishments.

Electric service in industry has permitted improvements in methods of production which have made this nation today the most prosperous in the history of the world.

Electric service in transportation, although it has created a system of local and interurban transportation that performs a major function in the upbuilding of our commonwealths, is but at the beginning of its full usefulness, as is demonstrated by the increasing trend toward steam railroad electrification. And in many other fields and in many other ways, electric service has increased national wealth, has accelerated national prosperity, and added to national resources.

Among the millions of our population, there is not an individual whose opportunities for a better, a broader, a more satisfying existence have not been multiplied because Mr. Edison started the electrical industry along the road of practical development and progress, and because men were found to continue that development and to bring to fruition the seeds that he planted.

It is then in terms of the benefits conferred upon the men and women of our country that the story of the electric industry from the days of Menlo Park to the present should be told if its real significance is to be unfolded, for an estimate of its greatness is not so much to be derived from a study of the financial manuals as from a knowledge of the way in which it has relieved men from the burden of labor, women from the toils of household drudgery, and has made easier and more productive the lives of millions of people.

There are a thousand functions that electricity now performs for us that in the days of our fathers involved hard manual labor and an expenditure of time that made working hours long and playtime short, and there is no better way to secure a realization of the changes that electrical development has wrought than to review one's personal activities during even a single day and note how they are affected by the various applications of electrical energy to our needs—the electric appliances that perform for us so many household tasks, the electric car or train that carries us to our places of business, the electric elevator that makes possible the skyscraper in which is located our office, the electric machinery that enters into the manufacturing processes that provide for our various requirements, the use of electricity in our hospitals and by our doctors and dentists, the telephone that is at our elbow as we work, the radio that may furnish our evening's entertainment if we do not patronize the moving picture house or the theatre, where, too, electricity plays an important part, the electric light that not only gives us necessary illumination but contributes new beauty and new grace wherever it is used—these and many more applications of electricity attest the almost revolutionary character of the change that has come over our manner of living since Mr. Edison completed his work upon the electric lamp.

When we consider the electric industry in the light of what it has accomplished, when we reckon the blessings that it has so universally conferred, when we contemplate the wide range of its activities intimately affecting as they do so great a majority of our people, we cease to wonder at the giant growth to which it has attained and to marvel at the magnitude of its financial and physical operations. No industry of lesser size could possibly have accomplished what it has accomplished. No organization of smaller scope could perform the service which it performs.

Development Not Automatic

The development which has resulted in its present widely extended usefulness has not been automatic. It was not enough that Mr. Edison should have perfected an incandescent lamp, should have put in operation the Pearl Street Station. Unless there had been scientists to devote their lives to laboratory and mathematical research, unless there had been inventors to apply the abstract principles thus discovered to practical utilization, unless there had been business men with vision wide enough and with optimism strong enough to foresee the commercial possibilities that lay ahead, we would still be living in the age of our fathers and the economic and social progress of the past fifty years would not have taken place.

The whole world glories in the achievements of that long list of men of science who have contributed to our knowledge of the natural laws that govern electricity; it is not slow to pay its tribute to the inventive genius that has given practical effect to those laws in the application of electrical energy to the requirements of mankind, and the time is coming I believe when it will recognize the service which has been performed in its behalf by those who instituted, who have built up, expanded and improved the great industrial organizations which placed at the command and within the means of so large a number of our people the benefits which the scientists, the inventors, and the engineers have created.

They have been pioneers in the field of economics and of business; they have discovered new laws and new principles governing the operations which they conducted and have not hesitated to apply them to promote public welfare; they have not failed to recognize the close alliance between science and business and have been more than liberal in contributions which permitted research and experimentation on a scale known to no other industry; they have readily accepted as an essential contribution to development the heavy charges for obsolescence which the progress of electrical science entailed.

Private Initiative Essential

With the record of the electric industry in mind, I have no fear of the future. It was conceived and has been developed as a private undertaking. Without the initiative, without the enterprise that comes with private as opposed to governmental operation, it would never have reached its present stage of usefulness. No government would, or should have taken the risk, have incurred the expenses, have suffered the losses that were necessary to its growth and expansion. Nor has the time yet come, nor is it in sight when the industry can successfully function without the same application of initiative and enterprise to its affairs. The industry has new fields to conquer, new realms to explore, and new services to perform. When we stop to think that its basic purpose is to provide energy, power, wherever and for whatever purpose energy and power are needed, we must realize that however great has been its accomplishment in the past, the extension and expansion that is to come will be immeasurably greater.

Upon the industry from its beginning has been imposed a public trust, which has become greater as its activities and usefulness have expanded, and which will continue to increase through the coming years as the essentiality of its service increases.

There has been no betrayal of that trust in the past and upon the members of this Association—executives, engineers, and all of us—devolves the duty of seeing to it that there is no betrayal in the future. We have still a great work to perform, and the inspiration that we draw from the achievements of our pioneers like Mr. Edison, to whom our heartfelt expressions of gratitude and appreciation go out today, will be with us in our onward march toward the goal of greater accomplishment.

Some years ago the Edison Pioneers graciously erected and dedicated with appropriate ceremonies, at which it was my privilege to be present, a tablet to Mr. Edison at Menlo Park. This was and is a fine piece of work. In view of the present status of the industry and its certain future, this tablet seems to me to be quite inadequate as an expression of public regard. His inventions are not commonplace. They are epoch-making and of world-wide fame. A grateful country has erected the Washington Monument and the Lincoln Memorial at Washington. Nearly all battlefields are marked with appropriate monuments. Surely, "Peace has her victories no less renowned than War."

A Noble Project Suggested

Mr. Henry Ford is constructing privately, so I am informed, an Edisonia Museum in Michigan. I offer the suggestion that in further celebration of the Fiftieth Anniversary of modern artificial light, a grateful industry aided by popular subscription erect at Menlo Park a suitable and enduring monument to commemorate the ability and genius of Mr. Edison, that will shine on throughout the ages by day and by night. The fact that Mr. Edison is still living seems to me to add luster to it. If this suggestion meets with favor, I pledge my personal and corporate cooperation in furtherance of the consummation of this noble project. (Applause).

CHAIRMAN EDGAR: I am going to ask Mr. E. Wilbur Rice to make the next presentation. Mr. Rice! (Applause).

INTRODUCTION OF HENRY FORD

By E. WILBUR RICE

Honorary Chairman of the Board, General Electric Company

It is an inspiration to be present and a great privilege to take an active part in the ceremonies of this unique occasion.

You have been given a picture of the growth of an industry by one of its early participants, and have had ably set forth the importance of the incandescent lamp in the development of that industry.

We have obtained some conception of the stupendous importance of electric power to our present social organization, and if, as we believe, this development of electric power was dependent upon the invention of the electric incandescent lamp, the vital and far-reaching character of that marvelous invention of Mr. Edison's, which we are now celebrating, is thoroughly established.

Although arc lighting by the series system preceded that of the incandescent lamp and had attained considerable importance when the Pearl Street Station was founded by Edison, the system developed by Edison was the only one which embodied the fundamental principles which permitted the economic and practical distribution of electric power.

These electric stations were designed to supply current to incandescent lamps, but it was soon apparent that a larger market for current could be obtained if motors were installed. This led by natural evolution to our present electric power era.

It is true that the low voltage of the incandescent lamp restricted the distance to which electricity could be economically supplied from one center; it is true that this limitation was removed by the development of the alternating current system by other men; but it is also true that the method of generation, distribution and use on the multiple arc plan is the system which has survived and has been utilized in all subsequent development of the art, and is today the method employed in all central station power transmission.

An Outstanding Achievement

Therefore, as I have frequently stated, the multiple arc system of distribution which Edison devised for his lamp constitutes one of the outstanding achievements in history. It is the only method by which electricity may be generated, distributed and used in unlimited amounts over unlimited areas and for all purposes.

Now this was all based upon Edison's discovery of the incandescent lamp, as his lamp and the system of generation, distribution, control and measurement of electricity to utilize his lamp formed the foundation of the entire electrical industry. It is for this reason that, when we visualize the industrial progress of the last fifty years we instinctively think of the name and the personality of Edison. His was the genius which made possible the diffusion of light around the world, and he built the foundation and pointed the way to the manufacture and distribution of unlimited electrical power. These two contributions entitle Edison to the distinction of having founded and fathered our present industrial era.

The electrical industry started with a clean slate; it was founded upon science, and the facts which it wrested from Nature's storehouse were greater marvels than any fiction the mind of man had ever imagined. It was fortunate in its leaders—men like Edison and Elihu Thomson—sincere, honest seekers after truth, with the highest ideals of life and of service to humanity.

A Leader in New Business Methods

The electrical industry was not only a pioneer in new technical developments, but a leader in new business methods. The customer was regarded as a friend who deserved good service in generous measure. The old relations between buyer and seller, which taught the buyer to mistrust the seller, were replaced by those of mutual respect and confidence. This has been the happy relation between the electrical manufacturers and the public utility companies for the nearly fifty years of my own personal experience, and this has been the dominating ideal of public electric utility companies in their relations with their own customers.

I believe that the stupendous success of the electric power and light industry has been based as firmly upon the honesty and wisdom of its business policies as upon the excellence and appeal of its technical product—its policies being the expression of the character and personality of its chosen leaders, who have constantly upheld its high ideals—ideals which our Master, Edison, has followed all his life.

Fifty years have passed since the invention of the incandescent lamp by Edison.

Thirty-three years have passed since another great event—the birth of a new means of transportation, the self-propelled motor car.

It has been pointed out that the amazing quantity of horsepower put at our disposal by the electric dynamo and the gas engine for service, now indispensable in the home, on the highway and in the factory is the distinguishing mark of American life at this time.

The individual destined to take a leading part in this new development was originally engaged in the electrical business. He was, in fact, the chief engineer of the Detroit Edison Co. The name of this remarkable genius, of course, instantly occurs to each and every one of you—Henry Ford.

How Mr. Ford Met Mr. Edison in 1896

Mr. Ford tells how at the time he was with the Detroit Edison Co., he first met Mr. Edison at a convention of the Edison Association at Manhattan Beach in 1896.

Mr. Ford was then working on his new idea, but all of his electrical associates had taken pains to tell him that the time spent on gasoline engines was utterly wasted, that the power of the future was to be electricity. Being in the same room with Edison he thought it would be a good idea to find out if the Master of Electricity thought it was going to be the only power in the future.

"I told him," said Mr. Ford, "what I was working on. At once he was interested. (He is interested in every search for new knowledge.) Then I asked him if he thought there was a future for the internal combustion engine. He answered something in this fashion: 'Yes, there is a big future in any lightweight engine that can develop a good horsepower and be self-contained. No one kind of motor power is ever going to do all the work of the country. We do not know what electricity can do, but I take it for granted that it cannot do everything. Keep on with your engine. If you can get what you are after, I can see a great future.'"

Such was his first meeting with Edison, and he did not see him again for many years. Now they are the closest of friends, and no one has paid a higher tribute to Edison's genius and personality than Mr. Ford. Notwithstanding all that Mr. Ford has done, he says that his contributions to society have been made possible only by Edison's contributions in the electrical field. In fact, he has made an even more remarkable statement, "that the distinctive production methods which have made the United States what it is are the direct result of Mr. Edison's inventions and discoveries."

This is a beautiful tribute from a man who himself has made such a great contribution to the happiness, pleasure and well-being of society; a man who has made himself a synonym of that great American idea, mass production; who, at a time when the American public were highly suspicious and unfriendly to great concentration of wealth and power, was permitted to accumulate both, not only without criticism, but with the manifest approval of the public. Incidentally, this may be taken as a rebuke to those cynics who assert that democracy can only appreciate and tolerate mediocrity.

It was no accident that later a great friendship sprang up between these two marvelous men. It was the inevitable result of that subtle but powerful magnetic influence which attracts and binds together kindred spirits. Each is in every sense a self-made man; each the architect of his own fortune; both are apostles of the doctrine that hard work is good for man.

Ford says: "The natural thing to do is to work; to recognize that prosperity and happiness can be obtained only through honest effort."

Visions Made Into Realities

Edison says that genius is largely hard work and perspiration, and that hard work is conducive to longevity and happiness. Both have as their ideal, "to make the world a better place in which to live." Their philosophy of life is evidently much the same, and happily they both have had glorious visions and both have made their visions into practical realities.

We like to think that the atmosphere which Ford breathed during his early connection with the electrical industry helped to confirm his natural taste for honesty as the only policy and the square deal as the only deal in human relations, as these are the ideals which he has followed in the development of his vast business—ideals which he calls "nothing but common sense."

Ford insists that his success is not to be measured in terms of wealth, no matter how fabulous, but rather by the quality of service which he has rendered humanity. A grateful world acknowledges the debt and rejoices that the donor has been so handsomely rewarded.

But Henry Ford is more than the world's most successful manufacturer. He is the greatest of dreamers and idealists. The electrical industry is indeed fortunate, and the world is to be congratulated that this modest but amazing genius has taken as a hobby the fascinating and useful idea of preserving for future generations the homely and simple tools which our Edison employed in making his great inventions.

This magnificent dream—the expression of Henry Ford's admiration for Edison—is rapidly becoming a living reality in a remarkable group of buildings at Dearborn, Mich., the Edison School of Technology and the great Museum of Americana. There Ford plans to perpetuate Edison's achievements in tangible form for the benefit of posterity.

And one of the most fascinating exhibits was recently made on the spot. The entrance to the Museum in Dearborn is modeled after Independence Hall in Philadelphia. As there is only one Liberty Bell, Ford decided to erect in place of the Liberty Bell a statue of Edison.

During a recent visit of Edison a concrete walk was being laid to the pedestal of this statue. In order to perpetuate Edison's visit, Ford asked him to walk upon the soft concrete. This Edison did, leaving his footprints in the concrete and his signature upon the pedestal.

Thus has this dreamer, Ford, left for posterity our Master's signature and footprints in solid concrete, instead of trusting to the shifting "sands of time."

There, in Dearborn, on Oct. 21 of this year, the Fiftieth Anniversary of the birth of the incandescent lamp, the celebration of Light's Golden Jubilee, which we are beginning here and now in this great convention, will be concluded with the reenactment of historic scenes of absorbing interest. Edison will then put in operation his same old machinery, in the same old laboratory of Menlo Park, restored by Henry Ford—his monument to his friend, which is destined to become a shrine for the American people.

Ladies and Gentlemen, I present this dreamer of magnificent visions, this friend of Edison's, this benefactor of all the world—Henry Ford.

[The audience arose and applauded.]

A Word From Mr. Ford

MR. HENRY FORD: We build at Dearborn 8000 complete electric light plants every day. This being an electric meeting I just thought I would say that. Thank you. (Applause).

CHAIRMAN EDGAR: To come from the sublime to the ridiculous, I am reminded of a story. Unlike many stories that are told on occasions like this, it is appropriate to the occasion. It has to do with Mr. Ford on the one part and with Mr. John A. Britton, a man whom we loved when he was with us and whom we revere now that he has passed on.

At the time of the San Francisco Exposition there was set aside a day for Mr. Edison. Among other functions there was one given at the University Club where 400 or 500 well-known men came to do honor to Mr. Edison. Mr. Ford was seated at the head table. After the various talks regarding Mr. Edison, the audience tried to get Mr. Ford on his feet. They were not as successful as you people have been today.

After the applause had lasted for perhaps five minutes, Mr. Britton got up from his chair, walked over to Mr. Ford's chair, and whispered something. Of course the audience was quieted. He then walked back to his seat (with my apologies to Mr. Ford) and said that Mr. Ford did not feel he would like to speak, but that he had an announcement which he wished Mr. Britton would make, and that is that next year he proposed to paint his cars yellow and sell them in bunches like bananas. That brought down the house. (Laughter).

The next in order is the third of the series of talking movies which were explained to you yesterday and the day before. As you know, Mr. Edison is not with us today. He and Mrs. Edison are both in Florida, and having this in mind he has taken part in a movie-talking picture which will now be shown.

GREETINGS TO THE CONVENTION*

By THOMAS A. EDISON

Before starting experiments on the incandescent electric light system, many memorandums were drawn up as to a general system that would permit of the subdivision of the lights into small units analogous to gas jets and with commercial economy superior to the prevailing gas system. The result was that if it was to be successful all the units must be worked in multiple arc. This necessitated the creation of lamps of very high resistance to diminish the enormous investment in copper necessary if low resistance lamps were to be used. This necessitated a very fine hair-like filament of high resistance material.

On Oct. 21, 1871, numerous experiments resulted in the production of a small unit lamp of comparatively enormous resistance. The filament being under conditions of great stability, after the result I knew the problem approached a commercial solution.

While these lamp experiments continued, other parts of the general system were actively experimented upon.

The dynamo as then in vogue was extremely inefficient, the loss approaching 50 per cent, due to some misunderstanding among electricians which I never comprehended. However, these experiments produced a dynamo of which 90 per cent of the energy was useful. Then meters for measuring the current used by thousands of customers, and also a host of accessories, like underground conduits, switches, sockets, etc., were necessary to make a complete system of distribution, all of which was accomplished.

After the installation of the first station in New York other improvements were added, such as the three wire system which reduced the copper conductor requirements more than 50 per cent. After this many central distribution stations were introduced. In those days I had a high opinion of this system, but I did not realize the stupendous electrical industry of today.

Naturally I am gratified to feel that I have been privileged to play a part in this achievement. I am proud of the electrical industry, of its vision, courage, zeal and devotion to the public service, and I suspect every American feels the same way about it.

It is a great reward for me and my colleagues and co-workers, many of them still living, that we have survived to see the fruit of our labors.

The record is wonderful, but fine as it is, it can be made still better, and I have a feeling that in your hands it will be.

CHAIRMAN EDGAR: I do not know just how to introduce the next gentleman. Ordinarily, I would call him the next speaker, but knowing something about him and his history, I have a feeling that that does not quite give the correct impression. He is a writer and a poet. There is hardly a phase of life in which he has not been engaged, not for the purpose of getting a story, but for the purpose of his livelihood.

In his early days he was a newspaper man in the Far West. It has been said of him that as a poet he sang of common people and common things, but the range of his poetic work was far wider than this. He sang and sings of whirring dynamos, of sweating workers, of office drudgers, stenographers, Babbitts and Main Streeters, but also of moonlight on the South Sea Beach, high adventure at home and afar, life and laughter in a world that he finds full of dreams and gallantries. Such is the man who will tell us of Aladdin and his lamp.

I take great pleasure in presenting to you Mr. Berton Braley.

THE LAMP OF ALADDIN

By BERTON BRALEY

Fifty years ago, Thomas Aladdin Edison rubbed a lamp. And not one genie, but thousands; not one slave of the lamp, but millions, answered to the magic thus evoked.

Where the Slave of Aladdin's lamp might move a palace a thousand miles, the Slaves of Edison's lamp have moved civilization forward a thousand years. Where the Slave of Aladdin's lamp could heap a hoard of gold and jewels before Aladdin's wondering eyes, the Slaves of Edison's lamp have created new wealth beyond the wildest dreams of Oriental magnificence, and made of the very earth itself a vast jewel coruscating with multicolored radiance.

What enchantment imaginable by the ancient sorcerers of East or West could approximate the glamorous spectacle that nightly thrills and dazzles our eyes along this sweep of golden sand?

---

*Presented as a "Talking-Movie."

And yet most of our poets, our painters, our writers, bewail the humdrum and monotony of this machine-age and sigh for the lost days of Romance. And the very dirge they chant for the deceased is broadcast over the impalpable ether on waves of wizardry; their words are cast into type by a machine swifter and more cunning than the fingers of any prestidigitator, and printed in hundreds of thousands by uncanny mechanisms that no old-time magician would dare to conceive.

This lament for vanished Romance is transported by couriers swift as seven-league boots and far smoother in action, or flung through the skies on wings of reality that outspeed the flight of any magic carpet of myth.

And at last the funeral sermon on Romance is read—as it was probably written—under the glow of a lamp whose light is fed by a terrific and intangible power no man knows, but which man has learned to control and direct.

The Song of the Dynamo

Some day, perhaps, those who try to sing the songs of a nation will tune in on the hum and purr of dynamos, the drone of planes in the infinite blue above us, the happy rhythm of motors that tirelessly serve by sea and land.

But today, it is the engineer, the scientist, the inventor and the businessman who concern themselves with Romance, who carry it on as their daily job, and who are too busy making sagas to sing them.

Fifty years ago, Thomas Aladdin Edison rubbed a lamp.

But unlike the Arabian Nights' Aladdin it was no fortuitous rubbing. It was not a magic that responded at the first touch. Miracles of modernity do not happen that way. Before Edison rubbed his lamp, he had to imagine his lamp, he had to create his lamp. And before he could either imagine or create he had to have the equipment of mind, of spirit and of body—the patience, the industry, the vision and the persistence that are back of any valid success. He had to have character—and further and beyond all that, he had to possess that unaccountable, elusive but inescapable quality that is known as Genius.

For with due credit and honor to the extraordinary capacity for concentration, the tireless courage and the patient application of Thomas Edison, with every emphasis upon the significance of these in what he has accomplished, the power that drives the whole is Genius.

And so he made his lamp. Created it literally out of a vacuum. And since there were no vacuums sufficiently empty for his purpose, he created his own vacuums.

The light of the world was to hang by a thread. Indeed, by the ashes of a thread. Wherefore all the world must be ransacked for a fiber that would glow and continue to glow after it had been burned.

The quest for the Golden Fleece was a mere jaunt by comparison to the search for this single filament. Finding a needle in a haystack was as easy as finding Cleopatra's Needle in Central Park when put beside this job of discovering the fibre for the incandescent lamp. If you can imagine a haystack composed of about every possible sort of fibrous material, and then patiently testing each separate strand, you have an approximation to the job that preceded the rubbing of the lamp.

But that story is known to most of this audience and to most of the world that now works and plays under the illumination resulting from that search for a thread. The thread is now a tungsten filament that gleams with greater brightness and lesser cost than when Edison first found the fiber he sought, but none the less practically the whole economic and industrial structure and mechanism of today can be said to hang by that single burnt thread which first successfully glowed in the vacuum Edison had himself created.

Fifty years ago Thomas Aladdin Edison rubbed a lamp.

Not immediately did a set of genii leap to serve it. Before modern genii can work their enchantments, they have to be equipped with tools and backed with money. But a plant in New York and a plant in Appleton, Wis., began to function—the New York station financed from the inventor's own purse, and a few homes knew for the first time, the luxury of light that is summoned and dismissed by the push of a button or the turn of a switch.

A new era was begun. What may be a new civilization was inaugurated. For seven thousand years or more of recorded history, there had been practically no progress in the utilization of the forces of nature in the service of man. Then Watt invented the steam engine, about 150 years ago. But though steam lifted a little of the burden from man's back and speeded his transportation greatly, the transportation of power itself was possible only for a few feet—and with huge waste.

Despite the improvements in steam engines, they were only improvements. For a hundred years, nothing—or practically nothing—developed to make possible the distribution of power. It could be concentrated in factories, it could be applied to move trains, and ships, but it could not be made available in small units for the home or the small shop.

The New Era of Power Distribution

The invention of the incandescent light heralded the beginning of the era of power distribution. The need of and the demand for this new, cleanly efficient and dependable form of illumination brought a need of and a demand for its wide use. And Edison himself, and hundreds of other brilliant Slaves and Masters of the Lamp, proceeded to fulfill the need the lamp had created. The central generating stations multiplied, alternating current and high tension transmission evolved in response to the country's necessities.

Greater grew the size of generators and wider the web of transmission lines. Perhaps the steam turbine might have come anyhow, but its invention and perfection were hastened by the demand of the electric industry for more efficient driving mechanism.

With the distribution of power in the form of light came the call for the localized use of the power itself. And thus there grew swiftly a phenomenon new in the world—the application of power in small units to the labor of household and of shop.

In nineteen million homes in America this localized power from central stations gives the light which makes naught of night. In these homes this distributed power purrs over tasks that once made housewives drudges. On thousands of farms this power runs the churns, milks the cows, does the washing, hums merrily as it does the cleaning that once made the farm wife a slave.

Out of the vacuum and the charred thread of the incandescent light has come ten billion dollars of new wealth—wealth that is added to the sum of things and subtracted only from the infinite and exhaustless forces of Nature. It is a kind of wealth that economists scarcely knew a hundred years ago—a kind of wealth that Russia, for example, denies—and starves by denying.

And this ten billions is only the material, tangible, touchable sum of these new riches. What the Lamp of Aladdin Edison and the electrification of America which followed it—and which has only begun—mean in terms of human comfort, human happiness, release from drudgery, increase in productiveness with larger leisure and broader opportunities are things beyond estimate—their full significance is imponderable and incalculable.

More Produced With Less Labor

Philosophers and economists who are still under the domination of economic shibboleths of a "golden era" that existed only in their imaginations may rail at mass production, but the mass that benefits by it knows that life is better, broader and kindlier because we produce more with less labor. That mass production creates millionaires is true, that it enables ordinary folk to live as no millionaire could have lived even a hundred years ago is less emphasized, but far more important.

All is not yet for the best in the best of all possible worlds, but the clear-eyed reporter of Things as They Are knows that this much-damned "remorseless mechanistic civilization" has made it a much more possible world for the average man than he ever knew before.

An operator at a lever
Doing a thousand men's endeavor;
A crane-man, sitting aloft, who runs
A titan, lifting a thousand tons;
A switchboard tender, bossing forces,
Stronger than a half a million horses;
These be spectacles characteristic
Of matters "grossly materialistic."

Of course, if you think of the sweat that's saved
Of the one-time drudges un-enslaved,
Of the way man's strength is multiplied,
And his dream-horizon amplified;
Of the larger scope of the human brain
When the body's free from its dreary strain—
If you think of these—then the dull machine
Might possibly, somehow, seem to mean
A little more than a mass of steel,
Might even distantly reveal
A sort of a soul whose patient might
Is lifting men upward to the light.
—But, of course, in this sordid, commercial day,
No Realist ever could think that way!

For the mechanism by which mass production is accomplished the Lamp of Aladdin Edison is basically responsible. Until that first crude but successful bulb glowed in his laboratory electricity was mostly something that coursed through arc-lights which sputtered and gathered bugs. From the date of his invention, electricity became the greatest single factor in the industrial progress of America and the world. It is because this country is electrified beyond any other that it excels in production and in industrial efficiency beyond any other. The incandescent lights the path of progress.

Mechanical Slaves Work Harder

And remember that this accelerating pace of industry, this high speed process is an acceleration of machines, not of men. It is the mechanical Slaves of the Lamp, not the human workmen that work harder and faster. It was in those good old days of hand labor that men were driven for twelve and fourteen hours a day, that men fell exhausted into bed at the end of a shift and woke only in time to begin another. Philosophers may hanker for those halcyon times, but the workingman cherishes no such illusions.

Fifty years ago Thomas Aladdin Edison rubbed a lamp.

Genii of the lamp answered the summons, and their magic was no mean necromancy. But being practical genii, scientific genii, far-seeing genii, they were not satisfied merely to serve the Master of the Lamp. They, like Aladdin Edison, dreamed dreams and saw visions—and made them real. They wasted no energy by appearing on thunderbolts, they harnessed the lightning instead. The lamp of Aladdin demanded power—the genii of the lamp made power available. They put the waterfalls to work, they taught steam to labor more efficiently, they changed chemistry from a compounding of drugs to a compounding of industrial forces. And they taught other genii to carry on and amplify their work.

So the magic of Aladdin Edison and those who follow him has multiplied and will multiply beyond our broadest imaginings. Around us here at Atlantic City is visible enchantment of light, of color and of beauty, that the genii have created for us. Perhaps the conventionally clad individual sitting next you is one of these genii—perhaps you're one of them yourself.

But the gorgeous show put on here is only the more obvious of the miracles that have resulted from the rubbing of Edison's Lamp. Magic and romance that would have dazzled Arthur and Launcelot and dumbfounded Merlin and Cagliostro surround us wherever we turn. When we click an electric switch, when we revolve a knob on a radio, when we lift a telephone receiver, when we watch and hear a movie, when we shoot skyward in an elevator, we are utilizing or summoning forces that those old-time romancers couldn't have conceived.

Romance at Every Turn

And less obvious wonders touch us at every turn. What we wear, what we eat, the house we live in, the office we work in, are tinged with the hues of romance and luminous with the St. Elmo's fire of wizardry. For our clothes are woven on fairy looms, our food is packed and shipped by mechanical magicians, our houses are heated, lighted, equipped with wonders and manifestations, our offices are laboratories of alchemy. We not only need not search for romance, but we must blind our eyes to escape it. It is not only in the earth below, the heavens above and the waters under the earth, it is in the packets of paper matches in our pockets and in the cigarettes that we light with those matches.

Fifty years ago Thomas Aladdin Edison rubbed a lamp and the electrical industry as we know it now was born. Its social, material, industrial and spiritual ramifications the historian of 3000 A. D. may possibly be able to estimate, but we cannot. We can count—by mathematics such as only an Einstein might understand—the physical wealth that hangs by that burnt fiber in a vacuum, but even with the aid of calculating machines that think and ledgers that talk we are probably shy several billions of dollars. Of the other values created by the Lamp of Aladdin we can have no approximation. We are in the realm of the infinite where, as Kipling says, the "blindest bluffs hold good, dear lass, and the wildest tales are true!"

Let the bards turn to yesterday for Romance; we know she is with us today and leading us into the bright and brave promise of tomorrow. We recognize her not only when she flashes across the sky with the air-mail, but when she perches in the grimy cab of the coal dumper beside the sooty-faced operator whose levers do the work of a thousand sweating men. She rides on the radio waves, and she runs the washing machine. Her glamor is no less now that she has gone to work than when she sang songs among the sirens as Ulysses passed, bound to his mast. And where once only a few adventurers might follow her fleeting footsteps, the Lamp of Aladdin now lights her trail for us all.

Invention Is Design

In this extension of the frontiers of achievement we have all had a part. Knowingly or unknowingly, we further the vision. But the vision itself must be that of Genius. Invention is not accident, but design. It is the application of mind to the problems of Matter that makes true magic—and the Wizard of Menlo Park is that kind of an enchanter.

Fifty years ago Thomas Aladdin Edison rubbed a lamp. And the magic of that lamp was the magic of thought.

Back of the beating hammer
By which the steel is wrought.
Back of the workshop's clamor
The seeker may find the Thought.
The Thought that is ever master
Of iron and steam and steel.
That rises above disaster
And tramples it under heel!

Back of the motors humming,
Back of the belts that sing,
Back of the forges drumming,
Back of the cranes that swing,
There is the eye which scans them
Watching through stress and strain,
There is the Mind which plans them—
Back of the brawn, the Brain!

The drudge may fret and tinker
Or Labor with lusty blows,
But back of him stands the Thinker,
The clear-eyed man who Knows;
For into each plow or saber,
Each piece and part and whole
Must go the Brains of Labor,
Which gives the work a soul!

Might of the roaring boiler,
Force of the engine's thrust,
Strength of the sweating toiler,
Greatly in these we trust.
But back of them stands the Schemer,
Putting the vision through
Back of the Job—the Dreamer
Who's making the dream come true!

CHAIRMAN EDGAR: The meeting now stands adjourned.

[The meeting adjourned at 12.50 p.m.]

FOURTH GENERAL SESSION

FRIDAY, JUNE 7, 1929

[The meeting convened at 10.05 a. m., President P. S. Arkwright presiding.]

PRESIDENT ARKWRIGHT: It is hardly necessary to ask you to come to order. Those who are so diligent and faithful are always in order.

Personally, I like a small audience. We get closer to each other and think along the same lines and understand what the other is thinking, with sympathetic appreciation of the other's viewpoint. So far as I am concerned I want to say to you that I appreciate your being here.

The first part of the meeting will be presided over by Vice-President Sampsell.

[Marshall E. Sampsell, Vice-President, assumed the Chair.]

CHAIRMAN SAMPSELL: Our President should indeed be happy today, for another Golden Jubilee shines from the skies. Each year we are vividly reminded that in the midst of life there is death. Mr. W. H. Onken, Jr., Chairman of the Memorials Committee, will now address you.

REPORT OF MEMORIALS COMMITTEE

By WILLIAM H. ONKEN, JR., *Chairman*

"An electric sign gone dark." That was the title chosen by the American poet, Carl Sandburg, for some obituary verses on the closing by death of the career of a queen of the stage. Is it not a title that without too great fancifulness might be written as an epitaph over the grave of every member of our great industry who realized its greatness and its beneficence and did what in him lay to make it greater and more beneficent yet?

To such men electricity is not merely an art, not merely a material achievement; it is a gospel, and they are its evangelists. When they are called hence it is as when lamps that spell words of comfort or encouragement are turned off, or the flood lighting that beautifies dark structures dies away. And this applies not only to the departed veterans who grew up with Edison, but to the younger men who seem to die before their work is finished.

In the words of that master painter in words, Robert Louis Stevenson, "All who have meant good work with their whole hearts have done good work, although they may die before they have the time to sign it. Every heart that has beat strong and cheerfully has left a hopeful impulse behind it in the world and bettered the tradition of mankind. . . . When the Greeks made their fine saying that those whom the Gods love die young, I cannot help believing they had this sort of death in their eye. For surely at whatever age it overtake the man this is to die young. Death has not been suffered to take so much as an illusion from his heart. In the hot-fit of life, a tiptoe on the highest point of being, he passes at a bound on to the other side. The noise of the mallet and chisel is scarcely quenched, the trumpets are hardly done blowing, when trailing with him clouds of glory, this happy starred, full-blooded spirit shoots into the spiritual land."

Among the members of this Association who have embarked to meet their pilot face to face were the following:

John W. Robb, of Clinton, Ind., past-president of the Indiana Electric Light Association, and one of the organizers of the Clinton Electric Company.

Herbert Lloyd, president of the Electric Storage Battery Company of Philadelphia.

Frank A. Gavagan, superintendent of distribution for the Consumers Power Company, Saginaw, Mich.

Robert I. Todd, prominently identified with public utility interests in Indianapolis, and a past-president of the American Electric Railway Association.

Arthur L. Freyer, of the Northern Indiana Public Service Company, Hammond, Ind.

J. T. Blacknall, general manager, Virginia Electric & Power Company, at Williamsburg, Va.

George L. Sadlers, manager of the Nashua District of the Public Service Company of New Hampshire.

Charles A. Sears, who at the time of his death was in charge of the erection of the mechanical equipment at Conowingo for Stone & Webster.

Frank N. Savage, superintendent of conduit construction of the Commonwealth Edison Company, Chicago, Ill.

William B. Wilkinson, district manager of the Ohio Power Company, Mount Vernon, Ohio.

Robert E. Brown, manager of the Mankato (Minn.) Division of the Northern States Power Company.

Walter N. Gordanier, superintendent of the Elektron Station of the Puget Sound Power & Light Company, Seattle, Wash.

Isaac Krall, an Edison Pioneer, for many years associated with the New York Edison Company.

Robert V. Prather, secretary of the Great Lakes Division of this Association, and secretary-treasurer of the Illinois State Electric Association, the Illinois Electric Association, and the Illinois State Gas Association.

Bernard J. Crahan, for many years connected with the American Electric Light & Power Company.

James M. Eglin, superintendent of the Underground System of the Philadelphia Electric Company.

Louis C. Laube, superintendent of the Ohio Power Company, Logan, Ohio.

Samuel G. Rhodes, general superintendent of the distribution and installation department of the New

York Edison Company. For a number of years Mr. Rhodes served on various technical committees of this and other national associations, and in addition conducted a considerable amount of original investigation for the New York Edison Company on street and park illumination. Mr. Rhodes had been a member of the engineering staff of the New York Edison Company since 1891.

Miss Harriet Billings, for many years assistant secretary of this Association, who died suddenly at the Martha Washington Hotel, New York, on Nov. 3. Miss Billings became identified with the National Electric Light Association in 1891 in the capacity of assistant secretary and treasurer. This position she filled until 1906, when she retired because of ill health. She took active charge of all the work of the committees, prepared all advance notices of the papers for the conventions, and for many years edited the Proceedings of the Association.

Col. Robert H. Timmons, assistant to the vice-president of the Kansas Gas & Electric Company, Wichita, and for more than a decade a figure of prominence in the electrical industry in the Middle West.

Nelson J. Young, assistant electrical engineer with the Rochester (N. Y.) Gas & Electric Corporation.

Lincoln Beerbower, manager of the Northern Division of the Oklahoma Gas & Electric Company at Enid.

Edwin W. Robertson of Columbia, S. C., at one time head of the Columbia Railway Gas & Electric Company, and of the Parr Shoals Power Company.

Andrew J. DeCamp, for more than forty years general manager of the Philadelphia Electric Company, and at the time of his death at the ripe age of 86 years, the oldest employee of the Philadelphia utility.

James A. Leroy, assistant to the superintendent of the Central Division of the Public Service Electric & Gas Company, Newark, N. J.

Oscar F. Lackey, at one time vice-president and general manager of the Colorado Springs Light, Heat & Power Company.

Benjamin N. Duke, who, with his brother, the late James B. Duke, was deeply interested in water power development in the South; was a director of the Duke Power Company, one of the subsidiaries of which is the Southern Power Company, operating in North and South Carolina.

H. A. Clarke, vice-president of the Penn-Ohio Edison Company.

Edward A. Batwell, public relations director of the Puget Sound Power & Light Company, Seattle.

Harold B. Whiteman, assistant to the vice-president, Allied Power & Light Corporation, New York.

Robert A. Speed, at one time president of the Memphis Gas & Electric Company, predecessor of the present Memphis Power & Light Company.

Leo H. Susman, general attorney for the Pacific Gas & Electric Company, San Francisco.

Harry L. Murdock, auditor of the Niagara Falls Power Company.

Henry W. Withers, head of the legal and claim department, Houston Lighting & Power Company, Texas.

Benjamin K. Howard, commercial manager of the Texas Power & Light Company.

George L. Estabrook, secretary and treasurer of the Portland (Ore.) Electric Power Company.

Andrew A. Cavanaugh, treasurer of the Wisconsin properties of the Northern States Power Company.

P. L. Griffith, formerly connected with the Pearson organization, an engineer of the Electric Bond & Share Company on most of its work in foreign countries.

Paul W. Barnes, distribution engineer of the Ohio Power Co., Coshocton.

W. H. Jones, president of the Atkins (Ark.) Light & Power Company.

William G. Kerckhoff, one of California's pioneers in hydro-electrical development and a leader and organizer of public utilities, who, with the late Henry E. Huntington, formed the Pacific Light & Power Company, now a part of the Southern California Edison Company, and later, with associates, acquired the San Joaquin Light & Power Corporation, now part of the Great Western Power Company.

John Wolff, for many years mechanical engineer of the Cleveland Electric Illuminating Company.

Paul L. Morgan, at one time general manager of the Jersey Central Power & Light Company and vice-president and general manager of A. E. Fitkin & Company.

Thomas S. Henderson, sales manager of the West Penn Power Company.

Charles L. Kurtz, formerly president of the Columbus (Ohio) Railway Power & Light Company.

William H. Detlefsen, chief engineer for the Alabama Power Company, at Mobile.

William S. Barker, controller of the Public Service Corporation of New Jersey.

George S. Carson, president of the Iowa City Gas & Electric Company prior to its absorption into the United Light & Power Co., and also president of the Iowa Gas & Electric Company before it was taken over by the Iowa Southern Utilities Company.

S. H. Brownlee, of the engineering department of the Niagara Falls Power Company.

Thomas F. Quigly, superintendent of the Yuma Utilities Co., Riverside, Cal., and an executive of the Southern Sierras Power Company of Mexico.

Frederick R. Slater, vice-president in charge of public relations of the Queensboro Gas & Electric Company at Far Rockaway, N. Y.

Wray L. Cole, an official of the old Rochester Railway & Light Company.

Fred B. Pitney, advertising manager of the Brooklyn Edison Company.

H. D. Seavey, United Electric Light Company, Springfield, Mass., who died suddenly June 6, here in Atlantic City.

Here ends this halting attempt to pay a debt by word of mouth to our associates who during the year have crossed the border of life into the impenetrable vastness of death. With all their weaknesses, it is comforting to feel that underneath are the everlasting arms. We shall think of them like sunset in the sky bequeathing to us the splendor of their prime.

CHAIRMAN SAMPSELL: Let us stand for a moment in silent reverence for those who have passed beyond.

[The audience arose and observed a moment of silence.]

CHAIRMAN SAMPSELL: Under the leadership of its Chairman, Mr. J. F. Ford, of the Philadelphia Electric Company, the Accounting Section has this year made further conspicuous progress along practical lines. In standardizing and simplifying our intricate accounting system they make it easy for us to know in which direction our operations are tending. Indeed, they constitute a dependable compass upon which, if we rely—and we will rely if we are wise—we can successfully chart our course.

It is a pleasure for me to introduce Mr. J. F. Ford. (Applause).

REPORT ON ACCOUNTING NATIONAL SECTION

By J. F. FORD, *Chairman*

We have been passing through one of the most strenuous years in the history of the electric light and power industry. In the many problems which have confronted us I feel that the Accounting Section has not been found wanting, and that we have gallantly and with fortitude met all the demands made upon us from our executives, the regulatory bodies, the Geographic Divisions and the National Association.

There has been marvelous progress in the past few years in our industry, and I feel the Accounting Section is entitled to some credit for keeping pace with all the advancements.

Persistent study and research by the several committees of the Section fully demonstrate that we are not lagging in the constructive and instructive work of the Association. This year, in my work as chairman of the Accounting National Section, I am more convinced than ever as to the importance of the accounting department of a public utility organization.

The Accounting Section—The Steering Wheel

From the organization of a public utility through consolidations and mergers and all the many ramifications of financing, the accounting department functions as the only recording channel of all its activities, and is the steering wheel which guides the executive in his contructive thinking.

The accounting section must be alert and on its toes continually, to meet the constantly changing conditions in the march of progress of the industry.

This association and the industry at large owe a debt of gratitude to the members of the several committees who have given so much time and energy in the preparation of the reports produced by the Section this year. When men of intelligence and ability, recruited from the National and Geographic Divisions, give their time and effort and are supported by their company executives, nothing but constructive results must be obtained.

The Accounting Section gives to those who take an active part therein a broader vision and an enthusiasm that is essential in the development of ideas. For this reason alone executives of member companies should encourage and see that members of their staffs serve on these committees. Executives are strongly urged to allow their accountants to serve on committees, attend meetings and perform geographic and national association work. It is not only a distinct advantage to each individual company, but a great educator to its accounting staff.

Permit me to ask what better means has this great industry of ours for developing and improving its accounting systems than through the medium of the accounting section, where the interchange of ideas is a constant source of improvement, which otherwise probably would remain undeveloped.

Closer Affiliation of Sections

I have endeavored during my administration to establish a closer cooperation with all the other national sections. I have found that there are an infinite number of questions arising in the commercial, engineering and public relations sections which need our assistance, and we need their assistance, so by closer affiliation we can be of infinite value to each other, to the association and to the member companies.

The accountant today stands in a different light. He is beginning to be recognized as one of the essential parts of a public utility enterprise. The accountant today tells you where we have been, where we are now and where we are going. The accountants are the compass for executives to steer their course toward the harbor of successful and financial results.

It had not been my intention to make any mention of the meetings of the Accounting Section during the year, but I feel that I can point with pride to the two very successful group meetings, at both of which the active interest and enthusiasm displayed by those in attendance were most remarkable. An innovation was adopted at these meetings in the form of general luncheon meetings—something new for the Accounting Section. These meetings were addressed by men prominent in the industry, who gave of their time to leave with those in attendance a message and an inspiration that was helpful to them in their daily tasks.

The serial reports that have been prepared by the various committees are a matter of record. They prove conclusively the valuable research work which has been done and are of unquestionable value to the industry as a whole.

An Outstanding Accomplishment

One of the most outstanding accomplishments of the Accounting Section in the past few years has been the establishing of a closer contact with the various sections of the Association and the Geographic Divisions and the benefits derived through these closer contacts undoubtedly accrue to the member companies.

I have been connected with the Accounting Section in many capacities for the past ten years and finally reached the goal of Chairman of the Accounting National Section. My administration and activities in past years have led me more forcibly to the idea that men in the industry must work up to their opportunities and work faithfully and conscientiously toward this goal, as it is an honor to be classed as a Chairman of the National Accounting Section and as Past Accounting Chairman. It is an honor to which every accountant should aspire, and executives of member companies should assist in seeing that their chief accounting officers have this ambition.

I have endeavored within my régime to meet all the conditions which have confronted this Section, have carefully selected assistants and outlined the work which was expected of them, and in every instance they have not been found wanting. I want now to thank in an humble way my able assistants, vice-chairmen, members-at-large, and the chairmen of the several committees for their most loyal support and untiring efforts in making this administration the success it may merit.

In closing my administration as chairman of the Accounting National Section I want to pass on to my successor that he continue those principles of expansion and development so ably carried on by my predecessors and which I have tried in my humble way to expand dependent upon them for further expansion and to carry on this good work to a successful and inspiring fruition.

In closing this report I want to express my personal appreciation of the splendid support and hearty cooperation I have received from headquarters; to Mr. Paul Clapp, who has shown by his personal attendance and talks before this Section his loyal and helpful support and suggestions; to Mr. A. Jackson Marshall, Secretary, who has given us every helpful suggestion and cooperation in our arrangement of meetings and programs; to Fred W. Herbert, Director of the Accounting Section, that untiring individual who is a stimulus for every chairman to put forth his best efforts and about whom too much cannot be said of his capabilities and willingness to serve, and to President Arkwright, who has taken a personal interest in our Section, devoting his time and energy toward stimulating interest in the Section.

In retiring as Chairman of the Accounting National Section I am not retiring in loyalty and further assistance, and hope I may long continue as an active member of this Section and give what service, experience and advice I can to help toward further accomplishments.

I have given my time and services most willingly to this work the past year, and if I have given anything constructive I am most grateful, but I feel I have been fully repaid by the experience I have had and the most pleasant acquaintances which I have made. My best wishes for my successor are that he may get the same pleasure out of this work as I have, and I know he will get the same cooperation and assistance which has been accorded me during my administration. (Applause).

CHAIRMAN SAMPSELL: When one approaches his work in the spirit just announced by Mr. Ford, nothing but success can follow.

At the request of President Arkwright, we will vary the program and now hear from Vice-President Owens, and the Vice-Chairman of the Constitutional Revision Committee.

REPORT OF CONSTITUTIONAL REVISION COMMITTEE

MR. J. F. OWENS: Your Constitutional Revision Committee elected at the first General Session on the morning of Tuesday, June 4, has reviewed the report of the Constitution and By-Laws Committee, and recommends that the annual dues of Class "F" members as now listed in the Constitution be changed from fixed to percentage dues, and that Section 6 be amended to provide that the rate of dues for Class "F" membership shall be 1/100 of 1 per cent of the gross sales for the preceding calendar year, and that the minimum dues of Class "F" members shall be $25 per annum.

Also, that the words "Electrical Jobbers" be changed to "Electrical Wholesalers" in Section 7 of Article 3.

Also, that the dues of Class "H" members shall be $50 instead of $20, as now set forth in the Constitution.

Your Constitutional Revision Committee recommends the adoption of these proposed amendments to the Constitution, and I so move you, Mr. Chairman.

[The motion was seconded, put to a vote and carried.]

CHAIRMAN SAMPSELL: Those of us who have spent our lives in congested districts, amid towers of stone and brick, little realize to what degree we are indebted to the American farmer who toils alone in open spaces. He has the same hopes and the same ambitions, the same desire for the good things of life that we have, and he is entitled to them. He needs, he wants and he is entitled to electric service. In cooperation with the Federal Government, State agencies, agricultural agencies, manufacturers of machinery of all kinds, and others, this Association, through its light and power members, has worked unceasingly to the end that the farmer may have electric service for all purposes.

The next speaker, Mr. J. R. Howard, of Clemens, Iowa, was the first president of the American Farm Bureau Federation. That Federation now has a membership of over 1,000,000. Mr. Howard was president of that organization for a number of years, and it was during his term of office that the Committee on Relation of Electricity to Agriculture was formed. He was indeed one of the five men who developed the idea of organized cooperation to solve the problems of carrying electric service to every farm in this country.

It is indeed a great pleasure to me to introduce Mr. Howard, and I know it will be to you to hear what he has to say to us this morning.

RURAL ELECTRIFICATION

BY J. R. HOWARD

Past President, American Farm Bureau Federation

I come before you today as an Iowa farmer who has no other interest than that of the farm on which I live and work. I am not here as a technician. I am here because the farm people are vitally interested in the practical applications of your industry. I feel the burden of the occasion today since I note that in a five-day program you are devoting about twenty-five minutes to the farm field where your immediate large expansion lies, and where a third of the people of the nation live. I sincerely hope your interest is not limited by your program allotment of time. More than 5,000,000 rural homes are your potential markets for power and light, and there are more miles of highway which some day will be illuminated than there are miles of city streets. This rural field is your field of immediate large expansion.

Other Kinds of Farm Relief

It would appear from press reports and political discussions that the farmer is wholly interested in political farm relief. We can perhaps agree that there have been, are and always will be acute farm problems, and that legislative relief must ultimately consist in the establishment of equality of opportunity between agriculture and other occupations, nothing more. But not all farm relief is political, and while Congress has been legislating and politicians palavering, the farmer has become increasingly active in other kinds of relief.

One of these is electric service. A survey of 22 of the principal agricultural states made by the Committee on Relation to Agriculture, shows that since 1923 rural electric service has rapidly increased as much as thirty-two-fold in some states. Today more than 15 per cent of our farms have electrical service, and the expansion is gaining momentum. More farmers today can intelligently discuss amperes and watts, and kilowatt-hours than can define debentures, or the principles of other various relief bills. This does not minimize the importance of the latter.

Economic Factors

There are certain factors of economics affecting agriculture that we are interested in today. The farmer must operate on much the same business system as do our public utilities. We on the farms have our fixed charges of taxes and interest which must be met. These are inflexible and quite uniform from year to year. Hence, easily determined but not easily voided. In addition to these, the farmer has his operating costs, consisting principally of labor, living expenses, machinery, fertilizer, seeds and many sundry articles. These operating charges vary from year to year, and some of them are capable of material reductions. Both operating costs and fixed charges must be met before the farmer can count profit which shall enable him to expand his operations and improve his plant. You have exactly similar problems, likewise your production and distribution present some striking parallels to that of the farmer.

It is obvious that profits may be created or increased either by increasing the prices of the product produced, or by decreasing production costs. In the past the principal gain has come from decreased production cost, and rural electrification holds the largest hope for future reductions. The farmer has made notable progress in efficiency of production. Products from the farms of the United States, measured in tons, bushels or gallons, have increased faster than population for several decades. If we consumed our own product without importing or exporting, 100 people would have had as much to eat and wear in 1925 as 105 had in 1890. If, however, we should take the year 1910, we would find that 100 people had as much as the people had in 1890.

This indicates there is some basis for thinking that in some future time we may find ourselves under the necessity of increased production, or the importation of foodstuffs, rather than be burdened with surpluses as we now are.

But the percentage of rural population compared to urban has steadily decreased since 1890. Dividing the total farm population by the rural population as given by the Census Bureau, we find the average production per worker on the farm has increased 38½ per cent within the 30 years. The new census will doubtless show much wider margins, and if those classed as rural only were actually engaged in farming, the increased per capita of productiveness would be still larger.

This increased productiveness is due to two causes: One is the improvement in the method of technique of operation, better varieties of both grain crops and live stock—agricultural education, if you please. The other general cause is summed up by saying that the use of farm power has greatly increased in 30 years—and you are interested in power. Indeed, that is almost a span of transition from the walking power to the tractor gang, and measures a change from the five and six-foot binder to the newly developed combine.

We must illustrate this power increase by stating that 30 years ago the farm power was largely in small type horses, a mixture of draft and road-bred crossed, in order to produce a general purpose animal. The 1400-pound horse is considered too heavy for general farm work. The 1200-pound horses were about the limit of draft power for most purposes. The horse team averaging 1600 or 1800 pounds would have no place in the machinery scheme of the earlier day, while the 1530 tractor was not even a dream.

One evening less than 30 days ago a man working for me came in a little early from the field with a tractor. He had disked twice and harrowed 40 acres of ground that day. It would have taken 5 men each with a 4-horse team to have accomplished this same result. The farmer has thus become a large user of power, and there is every reason to believe that the application of power to the business of farming is yet in the early stages of its development.

You need no statistics to prove that power is the coefficient of agricultural income and efficiency, whether that power be horse power or mechanical power. Of the three types of mechanical power as applied to farming, steam is practically obsolete. The internal-combustion engine, with its liquid fuel, has proven an efficient, adaptable economizer for many kinds of work, and will continue as a principal source of power until superseded by new discoveries and inventions.

Uses of the Electric Motor

The third power agency, like electricity, is more adaptable and efficient in doing every conceivable job about buildings and yards, and in every other place where high lines can be run. The desirability of the electric motor for running the milking machine and separating the shell from the feed grains, for pumping water and a multitude of other chores, is only fully appreciated by the man who must daily crank a gasoline engine on a below-zero morning. These kinds of work, too, are jobs where the greatest profit lies, and they will be better done by electricity than by hand because irksomeness and drudgery are removed.

Let me bring you this thought further. The uses of electric power are such as to stimulate a larger and better live stock and poultry production because they help the farmer to convert on his own farm the raw production from the field into production more finished and more valuable, and this in turn means added fertility, not depleted fields. In most sections of the United States the successful farmer has been an animal user. That has been particularly true during the past five years. More chores, better done, spells profit, and that is where electricity comes in.

A member of this convention remarked that states with large farms far between, like the Dakotas, could not well be electrified. True, if you are thinking of rural electricity in terms of lighter and small appliances only; but if you consider electricity from its power possibilities as applied to a well-diversified agriculture, you reach a solution of agricultural distress in those and other sections of the country similarly located.

Paying the Bills

It is useless to dwell upon so evident a thing as the desirability of electricity on the farm. The problem is paying the bills. When the high line comes it means the farm budget (too often already strained) must be stretched to meet monthly payments. To do this, electricity must be made to produce enough profit to pay its own bills. That is why I am dwelling largely upon its power functions. If it were a matter of farm lighting only, the 32-volt plant would in many cases prove adequate. In my own community it is the owner of the farm plant who, having had a little taste of electrical service, becomes the first signer for the high line.

That power is an economy is shown by the rapid increase of current on farms where high voltage is available. With this in mind, let me observe that when the farmer can be convinced that the rate which he must pay for this power is sufficiently low to materially decrease his production costs, it will be only a short time until high tension lines are as commonplace throughout the farming regions as our rural telephone lines. It is a mighty poor salesman today who cannot with a fair contract sell electrical service to the farmer, providing the farmer has confidence in the company with which he is dealing and is made to fully understand the terms of his contract.

Much, of course, depends upon the rate at which the current is sold to the farmer. So far as I know, there is every disposition on the part of the utility companies to make this rate a reasonable one. It is to be hoped that the companies may get and keep the good-will of the farmer in this respect. Rates determined by mutual agreement will in the end prove more satisfactory than those arbitrarily set by State or Federal commissions.

Progress for Agriculture

Just how an increased production through the use of cheaper power will affect the agricultural solution when there is already a burdensome surplus in some commodities, is problematic. Lower costs of production or higher prices for the commodity inevitably lead to increased production. This matter, in my opinion, will eventually take care of itself. Electricity means progress for agriculture. Nothing can stop its coming. The farmer is going to have it just the same as he has had his automobile, radio and every other thing which goes for increased living standards.

Much is said in discussing the farm situation about the large number of farmers who are forced to leave the soil because of economic conditions. I have already referred to the fact that a decreasing farm population has maintained a fair level of national per capita production. There are approximately 300,000 people who now annually are compelled to leave the farm because of the increasing efficiency of farmers as a whole. I am told that approximately 400,000 people are likewise compelled to seek new industrial connections for the same reason. It is no worse for a farmer to be forced from the soil because of mechanical progress than it is for the coal miner or the textile worker to be forced into other channels of employment. Indeed, to maintain the same relative proportion of rural and urban population that pertained 50 or even 30 years ago, would mean to remove as economic factors all such things as automobiles, self-binders, telephones, rural delivery and other things. The farmer himself would be the first man to object to this.

The farm problem is not to place a premium on inefficient production. It is ready to so improve processes of production, lower costs of production, and raise levels of rural standards that permanent farm prosperity and a contented farm people may always hold their rightful place in our national life.

I do not believe in a national farm policy, or a national industrial policy, or a national utilities policy. What we need is a national policy in which opinions and experience of the agricultural industry in all of its realms are properly timed and fully measured, so that all may move forward as a perfect working machine.

The Social Problem

We have been discussing the relationship of electricity to agriculture almost wholly from the power side. I recently noted an account of some social survey service which enumerated the number of homes in the country without light other than kerosene lamps. Without depreciation of the well-intentioned social worker, I call your attention to the fact that electricity on the farm is both a social and an economic problem. The farmer does not need to be educated as to his needs. He knows all about them now. Give him a price which will enable him to buy your commodity and he will demonstrate to you quickly that he can pick out his own motor needs, and his wife will demonstrate in short order that she knows as much about lighting fixtures and percolators, and electric curling irons, as does her city sister. (Applause). Indeed, from the household point of view electricity is of much greater importance on the farm than in the city. Electricity in the city home is in comparison with the farm home a luxury. It is non-productive in the city and productive on the farm. The farm woman can use the time saved from cleaning kerosene lamps in garden and poultry yards.

I know an Iowa banker who, on leaving college a quarter of a century ago, resolved he would never own a foot of land, but that he would keep his earnings so liquid that he could change from one hand to the other overnight. His first savings were invested in securities of electric railroads because he felt that they were supplying the great economic need of the country. Of course we all know those same roads are now strips of rust. This banker tells me that in 25 years he has had to change from hand to hand almost overnight, continually, in order to keep ahead of mechanical and scientific progress, which is continually making seemingly fundamental things obsolete. It may be the lines your companies are building now or planning to build, will be reduced to the junk value of copper almost before they are builded because of radio or other means of distribution. Be that as it may, these high lines along our highways denote real agricultural advancement. Power always spells progress. A farm on one of these lines is worth more than a similar farm a mile away. In building them you are doing more than distributing current, you are building communities —and communities make the nation. (Applause).

CHAIRMAN SAMPSELL: You will all agree with me that Mr. Howard has made a notable contribution to the subject he so ably discussed in his paper, a subject every one of our light and power companies is intensely interested in. I want to thank you, Mr. Howard, for your paper.

[President Arkwright assumed the Chair.]

PRESIDENT ARKWRIGHT: There will be a little change in the program of the morning. It has become necessary to wait a little while for the talking motion picture, so we have placed it immediately after the installation of the new officers to be elected. While that is not done by design, it is very fortunate that it is necessary to make the change. For one thing, it hastens your getting a new President. For the same reason, it hastens your getting rid of one you already have. I recommend to you that you do not fail to see this talking motion picture. You have seen the other three. You will agree with me I know that they cannot be surpassed in excellence, but that is because you haven't seen this one. It is by Sir Kengo Mori, in Japanese costume, Japanese scenery, spoken in broken English, and will entertain, interest, and instruct you. After the motion picture is over you can go if you feel like it, because you know the runner is going to be put out at the home plate whether you are here or not. There will be no surprise after the picture, except we are going to present to you the one event in the year which will be the happiest one for you, the present President who has been here for the year fades out with the picture. You might stay for the happiness that that will give you.

I take pleasure in presenting Mr. W. A. Jones, Vice-President of the Association, who will preside over the next few numbers.

I hope you won't think it amiss for me to suggest that you do not save your applause for the time when you get rid of your President, but use a little of it as you go along because it creates enthusiasm and expresses your own feelings. Don't be timid about it or too reserved. Come out and evidence what I know you feel.

Mr. W. A. Jones, Vice-President!

[Mr. Jones assumed the Chair.]

CHAIRMAN JONES: If I can add one word to what the President has told you, there will be a surprise following the motion picture listed on the program, and I hope that none of you will leave until you know what it is. I am not going to tell you.

Mr. Howard paid the light and power industry a tribute when he said that in electrifying the farm we were building industry. That is something worth while when it comes from a man who knows and appreciates very much industry building.

The light and power business has always tried to be, as President Arkwright has aptly said, good citizens wherever they serve. As a part of this program in 1927, President Arkwright headed a committee on Industrial Development in the United States, and carried on as Chairman of that Committee a very important piece of work. It is far reaching, the surface has only been scratched, and we expect to see as time goes on very important products of this piece of development work. There is no sectionalism in it. It does not mean that this association will attempt to take from one community and build in another, but it has to do with the real constructive type of industrial building in this country, which helps industry help itself.

I think perhaps the idea of the association doing this work sprang from the feeling that as an industry becomes larger its responsibility to society becomes greater; it becomes more and more incumbent upon that industry that it play its part in the stabilization of business. In undertaking this work it was realized that much help could be obtained from other industries and we are fortunate to have had the assistance of one of the largest of America's business institutions—the Metropolitan Life Insurance Company. We have here today the Vice-President of that institution, who will present to us the report of the industrial development work in the United States.

It is now my pleasure to present Mr. James L. Madden, Vice-President of the Metropolitan Life Insurance Company of New York. (Applause).

INDUSTRIAL DEVELOPMENT IN THE UNITED STATES AND CANADA

By JAMES L. MADDEN

Third Vice-President, Metropolitan Life Insurance Company, New York

The competition among cities for new industries has been called "The Battle of Smokestacks." Apparently many communities and local associations have been under the impression that their real industrial growth depended upon attracting industries from other cities. This gave rise to the preparation of organized plans to accomplish this purpose. We are living in a fact-finding age and the progressive businessman demands facts prior to the formulation of conclusions. When he turned toward the field of industrial development he found that the facts were clouded by the emphasis being put upon the migration or shifting of industry. No comprehensive, factual survey had been made which isolated the migration of industry from the other fundamental elements in industrial development and took stock of their collective effect upon economic growth. Yet all of these elements vitally affected the social and economic progress of American communities and geographical areas.

The absence of this factual information was responsible for the National Electric Light Association through its Civic Development Committee, determining to get at the fundamental industrial development situation in the United States during 1926 and 1927. The Metropolitan Life Insurance Company was invited by the Association to undertake this fact-finding enterprise in cooperation with it. Through the assistance of numerous public utility companies, railroads, chambers of commerce, and other associations, as well as governmental agencies, 2084 cities contributed their experience with the migration of industry as well as the other factors which entered into industrial development. These represented the experience of over 16,000 industrial firms. These cities also were representative of three-fourths of the urban population of the United States, and about two-thirds of the corresponding Canadian population. It is the purpose of this paper to set forth some observations based upon the compilation of this factual information.

Industrial Growth of Communities

First, let us give some attention to the industrial growth of communities. The various cities reported gains during 1926 and 1927 of over 10,000 plants which employed more than 371,000 employees. The migration of industry which has heretofore assumed so much importance in the matter of industrial development, is relegated to a much smaller role in our economic growth than was expected, for relocations, or the shifting of industry, accounted for only a little more than 9 per cent of the total plants gained by the various communities. The real industrial development came from new industries which were started within the communities themselves. These represented over 81 per cent of the plants gained. Branch plants were responsible for the remainder of the gains, and represented a little more than 8 per cent of total plants and 25 per cent of total employees gained. The experience in Canada is essentially the same in regard to these three sources of industrial development as that of the United States.

Measuring the size of the plants gained in terms of employees, we find the average branch plant had 102, the average relocated, or migrated industry, 71, and the average new local plant 25. While these figures are for the United States as a whole, the average size of plants gained when measured in terms of employees, varied with the geographical areas. In the South Atlantic States, for example, the average size of plants gained was 75, or more than twice the size of the national average. New England's average number of new employees was 47, and the Middle Atlantic States was 26.

Let us see which geographical areas profited most from each of the three sources of industrial gains. The Middle Atlantic States consisting of New York, New Jersey and Pennsylvania, showed the greatest gain due to the migration or relocation of industry. The New England States comprising Maine, New Hampshire, Vermont, Massachusetts, Rhode Island and Connecticut, rank second, and the East North Central States which consist of Ohio, Indiana, Illinois, Michigan and Wisconsin, rank third.

Again we find the Middle Atlantic States receiving a bigger gain from the establishment of branches than the other territories; the East North Central territory stands second, while the South Atlantic States, consisting of Delaware, Maryland, Virginia, West Virginia, North Carolina, South Carolina, Georgia and Florida, are third. As to the last source of industrial development, the establishment of local plants, the Middle Atlantic States again ran very substantially ahead of the other territories throughout the United States, New England taking second place, and the East North Central States third. If the South Atlantic territory, though, were combined with the East South Central territory, consisting of Kentucky, Tennessee, Alabama and Mississippi, their record would be extremely close to that of the East North Central territory.

Again using the nine geographical areas into which the Federal Census Bureau has divided the United States, let us see to what extent the three sources of industrial growth have been responsible for the gains in each of the various areas:

		Relocations Per cent.	Branches Per cent.	New Industries Per cent.
NEW ENGLAND	Plants	18.0	6.5	75.5
	Employees	28.3	16.0	55.7
MIDDLE ATLANTIC	Plants	5.7	4.3	90.0
	Employees	15.9	16.0	68.1
EAST NORTH CENTRAL	Plants	18.8	11.1	70.1
	Employees	28.7	26.9	44.4
WEST NORTH CENTRAL	Plants	9.6	17.6	72.8
	Employees	12.9	42.1	45.0
SOUTH ATLANTIC	Plants	13.4	19.2	67.4
	Employees	17.2	36.8	46.0
EAST SOUTH CENTRAL	Plants	6.2	20.1	73.7
	Employees	10.6	30.7	58.7
WEST SOUTH CENTRAL	Plants	8.1	16.0	75.9
	Employees	12.2	33.7	54.1
MOUNTAIN	Plants	4.0	28.3	67.7
	Employees	2.0	77.2	20.8
PACIFIC	Plants	6.4	16.9	76.7
	Employees	4.8	50.4	44.8

Reasons Underlying Location of Plants

You are naturally interested in the reasons underlying this industrial development. Markets are advanced most frequently as the reason for the location of plants. This is not surprising when one reviews the economic situation in the United States. While it is as important as ever to manufacture as cheaply and as well as possible, the primary problem confronting the manufacturers of today is to sell their products. The business man who has tuned in his sales practices to the high demands of his consumers is naturally going to consider the location of plants in relation to his marketing program. The closer his plant is to his markets the smaller will be his transportation costs, the quicker and better his service to consumers.

In many industries, though, labor is regarded as of most importance in the selection of plant sites. The survey indicates, in fact, that labor ranks second to markets as the predominating factor in the location of plants. Some manufacturers were primarily impressed with the general labor supply available in particular communities, while others were interested principally in the skilled or nonskilled supply of labor. The reasons advanced by some executives centered around the opportunity to secure steady, dependable types of labor. The prevailing wage scales in the communities selected for new plants were the predominating factors in the decision of many industries.

Importance of Transportation

When we realize the intimate relationship between marketing and transportation, it is not surprising that the latter, transportation, ranks in third place in point of importance in the selection of plant locations. The increased efficiency of the railroads under private enterprise has been a potent factor in the economic prosperity which the country as a whole has enjoyed. The extent to which improved railroad service has released capital for industrial purposes, through the elimination or reduction of inventories, the quicker delivery of raw materials to the plant, and the faster service from the plant to the consumer, cannot be over-emphasized.

We have mentioned the three main reasons underlying the gains of plants by the cities throughout the United States and Canada. It is significant that bonuses, free taxes, free land, or free factory buildings, which inducements at one time were frequently offered, and occasionally still are, do not appear among these reasons. Then, of course, there are many other reasons which the final report tabulates. There is one thing which is significant, and that is the increased thought which manufacturers are taking prior to the location of plant sites. Many of them are seeking the advice of engineers; others are going about the selection of their plant sites in just as thorough a manner as they do in selecting their mechanical equipment.

On the other hand, personal reasons creep in from time to time. For example, in one big city in the State of New York, a big plant decided to move away. Every effort was made to keep that plant, and when in disgust one of the city fathers went to a friend of the president and said, "Well, I have done everything I could to save the plant," the friend replied, "There is nothing you could have done to have saved that plant because the president's wife has decided that she wants to mix in the social circles in a big city on the Atlantic Coast."

Now then, personal reasons of that type often do creep in, but they do not account for any substantial part of the migration of industry or the location of plants, or the development of local plants.

Then, too, the local chambers of commerce have thrown a great deal of light upon the reasons underlying the location of plants, and I have brought with me just one letter which, if you will bear with me, I will read, taking excerpts to drive home the fundamental ideas which this Chamber Secretary has so well expressed:

"We are very glad a definite effort is being made to find out why industry is moving because we believe that when this information is made public it will have a tendency to discourage the ruinous competition between cities for factories. A number of cities in our state have had some sad experiences lately with bonus factories. Blank City is one of the outstanding examples. The people of that city raised a fund of $125,000 for a shoe company of another city in spite of the fact that they were warned the company was not in sound financial condition. A very fine factory was erected, but has never been operated, and nobody knows just when it will be in view of the fact that the X Shoe Company is now trying to effect a settlement of 15 cents on the dollar. The X plant is only one of eight factories presented to that company by small cities.

Many Offers Received

"For several years we have been kept busy offsetting the efforts made by commercial organizations in other cities to steal our factories. Our manufacturers receive offers almost daily, and some of them are so attractive that it is hard for the manufacturers to turn them down, especially if they happen to be having any kind of difficulty here. During the last twelve months two of our large factories suffered fires, and it took our very best efforts to keep these plants here because of the extravagant offers the owners received from the outside. It was largely due to the fact that the principal owners were active members of the local chamber that we were able to appeal to their civic pride in an effective way.

"Every fire, labor dispute, or any other condition that gets outside publicity, brings bonus committees here like a flock of vultures."

That is a straightforward letter from a chamber of commerce official. Fortunately, the survey was so broad that we were able to decide to our own satisfaction that after all conditions like that, while undoubtedly prevalent in certain localities, looking at the situation from a national viewpoint the manufacturers are showing a great deal of common sense in the scientific approach to the selection of their plant sites.

Just as the requirements of industries vary, so it is natural that the specific reasons underlying their selection of different geographical areas would not be the same. The food industry places most importance upon markets as the reason for the selection of plant sites. The textile group puts a greater stress upon labor in locating new plants. The machinery group gives primary emphasis to markets. The location of leather plants has been decided principally as a result of labor. The chemical group ranks markets as of most importance.

Industrial Losses in Communities

In order to get a more complete picture, let us for a moment think of the industrial losses in communities. During the period of investigation about 6000 plants were lost to American cities. That is quite a number. About 18 per cent of these moved away, while the remaining 82 per cent went out of business. The total number of plants lost was about 60 per cent of the plants gained. The information about the causes underlying these losses has not been nearly so complete as for the gains. In many cases the communities did not have this information, whereas in others they were not enthusiastic about releasing the available material.

There is one observation which stands out after reviewing the causes of plants lost. Many of them which have moved away have been influenced by reasons which might readily have been corrected if the local community had taken sufficient interest in the new industry not only to help it in becoming adjusted to the local conditions, but to continue this interest thereafter. The community which does not keep in close contact with its new industries might reasonably expect to lose some of those which have come from outside of the city. Certainly, whatever is done to help these outsiders likewise should be contributive toward the happiness and prosperity of the local industries which spring up within its borders. While there are numerous organized efforts supported with substantial sums of money to attract new industries from outside of their respective communities, we did not learn of one case during the survey where a community was placing equal emphasis upon aiding its own new industries.

If a community is really going to keep an accurate picture of its net gains it must record not only the number of lost plants, but more important, the reasons therefor. The latter will undoubtedly present suggestions for improvements from time to time. Then, too, the intimate contact which such an effort necessitates, will often result, as evidence disclosed by the investigation proves, in disgruntled industries being made happy and retained.

Large Versus Small Cities

Let us turn the searchlight of facts upon the industrial development of the large versus small cities. If we arbitrarily take a population of 50,000 as a dividing line between the larger and smaller cities, we find that the branches and relocations were divided nearly equally between these two types of cities, but that approximately three-fourths of the new local plants were established in the larger cities. All types of plants established in the larger cities accounted for only 58 per cent of the total gains in employment reported in the survey. There are various reasons for this continued industrial growth of the larger cities, one of which is the large number of satellite industries which are established around existing industries located therein, and another is the development of style industries, such as clothing and allied lines, which are usually located in metropolitan areas.

The extent to which the smaller cities have gained through relocations and branches is worthy of special note. Of all gains made by these cities, it is particularly important to observe that about one-fourth of the branches are located in cities of under 10,000 population, and about one-sixth of the relocations likewise went to these cities of less than 10,000 in population.

The foregoing statistical survey indicates that cities of 50,000 and over received about 73 per cent of all plant gains. The record of the smaller cities is undoubtedly better than this figure would indicate, because approximately 90 per cent of all cities in the United States with a population exceeding 10,000 made reports, whereas only 33 per cent of the cities between 2500 and 10,000 submitted their experience and a still smaller percentage of the cities under 2500. If we were to make an allowance for this unequal representation of the larger cities, the percentage of all plant gains by the cities under 50,000 would be increased to approximately 35 per cent.

The losses experienced by the different sized cities must be analyzed before the net gain can be determined. The larger cities experience a greater percentage of losses than the smaller ones. Thus the cities with a population of 50,000 or over, reported 83 per cent of the total losses in the number of plants and 70 per cent of the total losses in the number of employees included within the whole survey. When you deduct the losses from the gains you will find the cities of 50,000 or over showed a net increase in plants gained of about 60 per cent, whereas the smaller cities showed a net gain of about 40 per cent.

Another Channel of Approach

There is another way of considering this large versus small cities, and that is, to find out the extent to which each is receiving the larger plants, say plants of over 100 employees, and when this test is applied we will find that the larger cities, those over 50,000 population, received during that period 54 per cent of these larger plants, which means that the cities of under 50,000 obviously had the other 46 per cent, more than one-half of which located in cities of less than 10,000 population.

As to the reasons underlying the industrial growth of the smaller cities, those most frequently reported might directly or indirectly be related to lower manufacturing costs. The improvement in railway and power service, though, has undoubtedly been a factor in the development of these cities. Electrical power, for example, has become available within the last five years for the first time to 4000 towns and small cities formerly without service. These small towns now have the same quality of 24-hour electric service formerly enjoyed only by large cities. They also have unlimited electric power supplies available to them to meet the expanding demands incidental to the growth of their communities. Factories can now locate in a small town supplied with electric power from an interconnected system, confident that they can have dependable electric service.

While the larger cities are still getting most of the new plants of all kinds, a tendency in favor of the smaller cities is rather pronounced. Growth of the industrial suburban towns around the larger cities is a reminder of these trends. One very significant fact, for example, is that in the South Atlantic Territory 40 per cent of all plants gained went to towns of under 10,000 population. Another significant trend is that an analysis of migrations, or the relocations in the nine geographical areas into which the census bureau has divided the United States, shows that the preponderant movement was from the larger to the smaller cities, with the exception of three territories, the West North Central, the West South Central and the Pacific Coast, and in all of these three territories the reasons for the reverse movement assigned by those making the movement was the market factor.

Industrial Development by Industries

We might think of this industrial development in another way, and that is, by the specific industries themselves. There are, for example, more relocations—or putting it in another way, there is more migration of industries in the textiles and allied products than in any other industry. Machinery ranks second; lumber and allied lines third, and leather and associated products fourth. Now let us think in terms of branches, and then we find that food and kindred products, during the two-year period investigated, established more of them than any other line of business endeavor; textiles ran second; chemicals third, and machinery fourth. In regard to the third source of industrial development, the record for establishing the greatest number of new local plants was made by the textile industry; the paper and printing industry ranked second; food and kindred products, third, and lumber and allied lines, fourth.

Summing up all gains, we find that the textile industry and allied products are responsible for a little more than 22 per cent of the total plants established in the United States during the period under observation; food and kindred products were second with over 10 per cent; paper and printing was third, with over 9 per cent; while lumber and allied products ranked fourth, with over 7 per cent, the machinery group being slightly below this.

You are probably wondering why the Metropolitan Life Insurance Company accepted the invitation of your Civic Development Committee to undertake this cooperative survey. The Metropolitan has approximately one out of every five men, women and children in the United States and Canada insured with it for over sixteen and one-quarter billion dollars of life insurance. The company has two definite interests in these policyholders. It wants them to keep well and, therefore, maintains an extensive health service, and it is interested in their stability of employment and consequently maintains a broad, economic service. If the Metropolitan can contribute through its economic services toward the stabilization of industry through better management, its policyholders will benefit through greater stability of employment. The company believes in the interdependence of business and the importance of team-play between the component parts of our economic structure, looking toward their mutual prosperity.

It has been a very real pleasure to cooperate with your Civic Development Committee and the officers of your Association in this investigation. The executives of your public utility companies, as well as those of railroads, banks, chambers of commerce, the United States Chamber of Commerce and other organizations throughout the United States and Canada, have cooperated in a whole-hearted manner. Without such assistance the undertaking would have been an impossible one, and it is, therefore, my privilege to express to you our very real appreciation of this enthusiastic aid.

Definite Tendencies

Let us review some of the definite tendencies which the survey has developed. The migration, or the physical shifting of industry, is not the factor in industrial development which many thought. The real development has come from the establishment of new local industries and the setting up of branches in order to tune in with the marketing situation.

No data were developed during the survey about the expansion of existing industries, yet from the standpoint of economic growth this represents just as real an increase in community wealth and opportunity for additional employment as relocations, branches or new local industries. The reason for the failure to get these data was that the communities in the main did not collect them.

Enough emphasis has not been placed upon the analysis of losses of plants, and comparatively little is being done in a definite, organized way to make the new local and already existing industries in a community so happy and prosperous that they want to stay. Yet substantial sums of money very frequently have been raised and definitely organized movements initiated for the purpose of attracting industries from other cities. The real prosperity of a community depends upon stabilization, and the losses of industries tend to upset this condition. The large cities still receive most of the plants, but there is a strong tendency toward the establishment of relocated industries and branches in the smaller cities. About 40 per cent of the net gains of all plants has been in the smaller cities.

There is a definite need for the present pioneering effort to be continued on a systematic basis. The development and movement of industry so affects our social and economic growth, nationally and territorially, that some machinery is necessary to record what is taking place. Yet no such machinery exists. It would seem that a neutral agency, such as the United States Department of Commerce, would be the logical body to carry on continuously this effort to know at all times how, why and where industry is growing or moving.

There is one observation which stands above all others in the survey; the greatest industrial development comes from SELF-development rather than from attempting to attract industries from other communities. (Applause).

CHAIRMAN JONES: I believe you will agree with me that this industry is indebted to Mr. Madden and the Metropolitan Life Insurance Company for their valuable services in connection with this work in civic development. If we are assisting in any way in stopping the economic waste which has been increasing yearly in chasing industries from one section of the country to another, we are doing a good job.

I think it is interesting that this Association is big enough to take that national view as against the view of sectionalism, and if this Association has done any one thing that justifies its existence I think that alone might stand out, the elimination of the sectionalism that disregards economics, for what is more unsound than the dragging of one industry from New England to the South, or from the South to the West Coast, or anywhere else, if that industry is already properly located. So if we can help point the way to sound economics in industrial development, we are playing a part and being good citizens where we serve.

This industry, unlike some others, is not only regulated by competition—I think perhaps some people still feel that there is no such thing as competition in this business—but in addition we are regulated by municipal and State bodies, who supervise our rules of conduct, tell us what we shall charge for our service, and discipline us in many other ways. As to whether regulation is good or bad for us, it is still a matter of some doubt in the minds of the leaders of business, but it is with us and it is perhaps here to stay in some form. If the character of our business changes, no doubt regulation will change with it.

Our next speaker is a man who has made a close study of regulation from its beginning. It is my pleasure now to present Mr. W. J. Hagenah, Vice-President of the Byllesby Engineering & Management Corporation, who will speak to us on the subject of Regulation.

PUBLIC UTILITY REGULATION AND ITS ACCOMPLISHMENTS

By WILLIAM J. HAGENAH
Vice-President, Byllesby Engineering & Management Corporation, Chicago, Ill.

There are perhaps few people today who are not familiar in a general way at least with the extent and workings of public utility commissions. Looking over the record of twenty years of State regulation, the question may now be asked, What has regulation accomplished? The answer is that State regulation laid the foundation for the remarkable improvement of this industry in service-rendering capacity, reduction of rates and public investment support. It has substituted scientific rate-making for the hodge-podge that unregulated competition and political trafficking had produced; it made clear to the public how wasteful utility competition was; it developed the indeterminate permit in place of the rigid long-term franchise that so often defeated real progress in service development and reductions in rates; it showed the impracticability of "home rule" for cities because the electric industry was not a local institution; and it exposed the misrepresentations and accounting irregularities of municipally-owned electric plants.

When 47 States prescribe by statute for the regulation of public service corporations, when 43 through specially created commissions restrict earnings to a reasonable return on the fair value of the property devoted to the public service, when 23 States supervise the issuance of utility securities—all with the approval of the highest courts of the land—it is obvious that new business fundamentals have here been established.

The adoption of this public policy came on the eve of a great technical advancement in electricity, in chemistry and in the mechanical sciences. This awakening, together with the World War, stimulated industrial production as never before, and opened the door to better standards of living. The resulting demands for electricity doubled and redoubled. The greatly expanded properties and increased production made lower rates possible, and with each reduction new fields for business development were opened. Public confidence was won as no other industry in America has succeeded in doing, and with the proof of political square-dealing capital flowed to the utilities in increased volume and at steadily lower costs.

With the greatly improved technical processes, largely based on utility service, the productive power of the American people and their output per person employed in industry increased so largely that in some industries the labor cost per unit of production has reached the lowest point in history, and this in spite of an approximate doubling of wage scales. Under this condition we have developed a mechanical power per man employed that is from two to three times as large as our European competitors, and our production and consumption per capita have now reached the highest point in the history of any country.

Yet in the midst of the widespread prosperity that we have witnessed, to which regulation has been a large contributing factor, the electric utility industry is today being subjected to attack. There are those who tell the public that great wrongs are being committted and that legislative bodies must assert themselves to protect the people against the encroachments of the power corporations. There were more utility bills introduced during the last sessions of the State legislatures than in any year since the beginning of regulation. Finally, the Federal Trade Commission is conducting an exhaustive investigation into all phases of this business. It is not surprising, therefore, that some people are beginning to wonder whether there may not be something wrong in this industry that calls for corrective legislation.

That there are individual and corporate abuses in the utility situation no well-informed person will question. They are regrettable, and they will be corrected as similar abuses have been corrected in every rapidly growing industry. It will, however, not be conceded that these conditions are serious, or that they call for legislative action. In many instances these attacks are mere exaggerations, unsupported by facts, and made with a selfish personal motive. Nevertheless they are unfair and disturbing to every conscientious electric utility executive, but there is comfort in the fact that these charges can be met by a frank statement of the facts which the excellent public records accumulated under public utility regulation now make available to the industry and to the public.

Reviewing the Facts

Time will not permit a review of all the accomplishments of regulation, but the facts concerning three subjects in respect to which the electric utilities are now being subjected to criticism can be stated definitely:

1. Every economy resulting from the progress of the electric art, or increased efficiency in the electric utility industry, has been transmitted to the public through lower rates.
2. The earnings of the electric utilities are among the lowest of the major industries in America.
3. There is no inflation in the securities of the operating electric utilities nor in the securities of the larger and older holding companies.

Let me discuss these briefly. First, as to the reduction of rates in the face of advancing costs. During the last fifteen years, which include the period of the World War, the post-war deflation, and the recent period of great industrial activity, practically every item of cost entering into the construction and operation of electric utilities has greatly increased. Nevertheless, electric rates have tended steadily downward. Electric service is today one of the few items entering into the family budget that can be obtained at substantially lower cost than in 1913, and State regulation has been a major factor in bringing about this distinct public gain.

Because the residence lighting service affects the largest number of customers and is also the least competitive and, therefore, more easily exploited in the absence of effective regulation, were such attempt seriously made, the rates for this class of service can best be made the basis for such a comparison and study. It is to these rates that public agitation is almost exclusively directed and where the test of the results of regulation must be applied.

Principal Items of Cost

The principal items of cost with which the electric utility, just as well as every other class of business, must contend are wages, material prices, taxes and the cost of money. Fortunately data covering each of these items are obtainable from official and semi-official sources, and may be reduced to index numbers for comparative purposes. According to these records, the index number of wholesale commodity prices as determined by the United States Bureau of Labor reached a peak of over 220 in 1920, as compared with 100 for 1913, and following the reaction in 1921 has become fairly stabilized on a basis that is now approximately 50 per cent higher than the pre-war level.

As this index number deals mostly with raw materials priced at wholesale, and in which labor is but a minor factor, it by no means reflects the conditions with which the utilities were confronted. Because of the large amount of skilled labor present in construction undertakings, the index numbers of electric utility construction costs have been separately computed, and these indicated a peak of 196 in 1920, with a later stabilized condition, but gradually declining costs, now reaching a level nearly 70 per cent above the pre-war level.

Factory skilled labor, an important item of cost in all the materials and supplies purchased for construction and operation, today stands 120 per cent above the pre-war level. Union labor, which is a large factor in the construction and operation of electric utilities, has continued strongly upward ever since 1913, and today stands at a level 140 per cent above pre-war wages, the highest point that wages have reached in the history of civilization. Interest rates covering utility financing, while reaching an almost prohibitive figure immediately after the war, have declined, but are still higher than in 1913. State and local taxes, which each year take an increasing percentage of the gross and net earnings of utilities, are today occasioning grave concern in the electric industry. They have increased violently and without interruption since 1913, and give no indication of a stabilizing tendency, much less a decline. Yet with all those items entering into the cost of supplying electricity to the rate payers, residential rates have tended steadily downward since the beginning of the war, and today show for the United States an average of over 25 per cent below the 1913 level.

It is interesting at this time, when both the electric industry and the work of the regulatory commissions are being subjected to criticism, to note how quickly private industry and individuals adjusted themselves to these conditions by rapidly advancing prices, wages and interest. It is also interesting to note the large increases in the cost of government, which increases are continuing to this day. From a per capita State and local tax burden of $15.81 in 1913, there was a quick advance to $28.24 in 1919. This increase was explained, and everyone accepted the explanation, as due to the war and the social changes which followed the war. Since the close of the war, however, this tax burden has continued to grow more rapidly than ever before in American history, reaching in 1927 the disturbing total of $48.39 per capita, or over three times the cost of conducting our State and local governments before the war.

Such tax increases are explained by government ownership advocates as due to the higher cost of labor and material and the ever-expanding activities of the State and local governments. Even the casual observer, however, will note that the principles of regulation, and the economies which were enforced by the commissions among the utilities, were never employed in the departments of the government themselves. When mounting costs and the declining purchasing power of the dollar of income destroyed their pre-war rate basis, the utilities were compelled to ask for some relief, but never did the total increases granted by the commissions bring the residence rates back to the level that obtained in 1913. Even by 1920, when the peak of wages and prices generally was reached in the United States, the entire increase granted in residence rates had been wiped out by reductions ordered by the commissions or voluntarily granted by the utilities.

Constant Downward Revision of Rates

What has made possible the continuing reduction of electric rates in the face of this disturbing economic condition and advancing wage and price levels? The answer is to be found in the remarkable progress made by the electrical industry itself and the reduced cost of producing and distributing energy. This was brought about by larger and more efficient units of production, the greater productivity of labor, the interconnection of utilities, and the increased economy of operation and efficiency of management made possible by the development of the holding companies. These great savings that resulted from inventions, improvements in technical processes and efficiency in management have been transmitted to the public through the constant downward revision of rates.

The profits have not been retained by the utilities, for at no time have the commissions permitted the utilities to earn rates that would yield more than a reasonable return on the fair value of their properties. The influence of the State commissions has always been present, both in formal and informal negotiations, in carrying out the spirit of the utility laws and the economic concept of a public utility.

Every saving by the utilities almost as soon as it was accomplished has been passed on through lower rates to the public. During this same period private industries, limited only by the restraints of competitive business, not only advanced prices violently, but generally maintained them at a level far in excess of pre-war prices, and with high profit to themselves.

Let me turn now to the second major accomplishment of regulation. Commission regulation has maintained electric rates at such a level that the earnings of the power companies yield no more than a fair return. The income of different companies naturally varies, but the earnings of the industry as a whole are not excessive and are far below those found in other fields of endeavor. A comparison of the earnings of private industries with those of the electric utilities provides a sufficient answer to any contention that the public is being exploited by the power industry. It also provides a convincing reply to the charge that the utility commissions, because of court decisions, are no longer able to function for the protection of the public. Statistics have recently been compiled by the National City Bank of New York, covering 772 business establishments, representing 31 different industries. These computations set forth the relative net profits in 1928 expressed in terms of per cent of the net worth of each industrial group at the beginning of that year. The net worth for these industries was computed by taking the capital stock outstanding and the surplus account for each individual company for which the data were available. To show the extent of this survey, let me say that the 772 establishments had a gross income in 1928 of nearly $2,800,000,000, and represented a net worth of $19,943,000,000, or more than twice the total investment in the operating electric industry.

Net Profits of Private Industries

The net profits for only a few of these industries can in this limited time be referred to. The automobile industry in the United States earned 28 per cent; drugs and sundries, 24 per cent; printing and publishing, 23 per cent; milling flour and baking, 21 per cent; household equipment, 18 per cent; industrial chemical lines, 17 per cent; merchandising, 16 per cent; food products, electrical equipment, and office equipment, 16 per cent; copper mining, 13 per cent; tobacco manufacture, 13 per cent; machinery, 11 per cent, and agricultural implements, 12 per cent. I might go through the entire list of 31 industries if time permitted. The average earnings shown by this great cross section of America's unregulated business was 14 per cent on the net worth, after paying all operating expenses, depreciation, taxes and interest.

Compare these earnings with the returns computed on the same basis for the leading electrical companies under State regulation in 1927, the latest year for which the data are available. Such a study covering 30 properties with an aggregate book cost of over $4,143,000,000, showed profits on the combined capital stock and surplus, not the value of the property, of 9.1 per cent, after taking care of depreciation and taxes, and bond interest. This percentage, however, is misleading because the capital structures and fixed charges of the different industries differ materially. Further, private industry sets aside reserves not allowable to electric utilities under State regulation, and in the private industries embraced in the study mentioned were many companies having little or no funded debt. The average earnings of 14 per cent in private industry, therefore, represent the return on a much larger proportion of the total investment than is true for electric utilities.

Comparison of Returns

Were the industrial net profits related to a smaller share capital, such as we find in the electric industry capital structure, the returns of private industry for comparative purposes become approximately 20 per cent. The measure of return for the electric utilities, however, can only be correctly expressed when the 9.1 per cent earned on the capital stock and surplus is related to the entire property, because that is the lawful basis of value under regulation.

The capital structure of the electric utilities now shows an almost equal division between bonded indebtedness and capital stock. When the cost of capital for these different forms of securities is applied to such capital structure, the net return after depreciation, taxes, and bond interest of 9.1 per cent on only the capital stock and surplus, discloses a considerably lower return on the fair value of the property on which the returns to electric utilities must be computed. An analysis has been made of all the electric bond issues listed on American exchanges where the amount involved in each case is over $500,000, and where there have been open market sales from which true value quotations are obtainable. This study covered $2,091,000,000 of bonds having the four highest investment ratings. It developed that the cost of money to the public utilities under these four high grades of bond issues, including amortization of discounts, commissions, brokerage fees and legal opinions pertaining thereto, was 6.1 per cent.

Applying now these two percentages, that is, 6.1 per cent to a 50 per cent bond structure, and 9.1 per cent to a 50 per cent capital stock structure, it develops that the 30 largest operating electric utilities in the United States in 1927 averaged 7.63 per cent on the value of their property as determined by the laws of regulation. These 30 companies, however, operate in the larger cities where the profits naturally are higher than for the companies that serve the smaller cities, and that reach out into the rural communities. When the average earnings of the most favorably situated and the most prosperous companies do not exceed 7.63 on the fair value of their properties, while those for the industry as a whole are considerably less, it follows that the commissions have permitted only such earnings as are necessary to attract sufficient capital to make possible the expansion of the electric industry, while transmitting to the public through reduced rates all earnings beyond the measure of a fair return as indicated by the decisions of the United States Supreme Court.

Thirdly, State regulation has prevented capital inflation in this industry. How can there be overcapitalization, let me ask, when the commissions fix rates on bases that yield no more than a reasonable return on the fair value of the property dedicated to the public use, when the commissions supervise the issuance of securities, and when they prescribe accounting systems and see that the books are properly kept? This assuredly enforces conservative capitalization and gives protection to the investments in the hands of the public. Is this not an explanation for the great investment movement among people of small means and by trust institutions to buy the securities of the electric industry? In no other field is there so close a relationship between the fair value of the property assets and the securities outstanding against them. This conclusion is supported both by the accounts of the electric utilities and by the decisions of the commissions.

Property Costs and Securities Outstanding

It is possible to ascertain the relationship between the property costs and the securities outstanding for a sufficient number of individual companies, making up in the aggregate a large percentage of the total industry, and thereby establish the fact that there is no capital inflation in either the electric utility operating field or among the older and larger holding companies.

This study can be made by analyzing the balance sheet accounts of the operating companies and the holding companies, and grouping them according to their character, as follows: First, operating electric companies deriving over 95 per cent of their gross income from electric operations. Second, operating companies associated with gas or railway companies, but obtaining between 60 and 95 per cent of their total income from electric operations. Third, holding companies which publish sufficiently detailed balance sheet data of their own operations distinct from consolidated balance sheets of their subsidiaries.

Such a study has been made for the industry covering the year 1927. Let me refer first to the group having earnings from electric operations exceeding 95 per cent of their total gross revenues. This group embraces 195 electric companies which comprise approximately 50 per cent of the total investment in the electric operating properties.

According to an analysis of their balance sheets, the book cost of these properties was $4,772,781,000, while their capitalization is but $4,491,861,000, or less than the invested capital by $280,920,000. There is consequently an excess of assets over securities outstanding of 6 per cent. This, however, does not reflect the true relationship, for in utility regulation it is the fair value of the property on which earnings are computed. Neither does the par value of the securities necessarily measure the total amount that the utilities received from such securities and invested in their property and plants. Certain adjustments are therefore necessary before the true relationship can be expressed. The earning power under regulation determines what is in the last analysis the true asset value of a utility property, offset against its outstanding securities. Consideration must therefore be given to what extent the book cost reflects the fair present value under regulation.

Cost studies indicate that for many large electric utilities approximately 70 per cent of the total property now in service has been constructed since the beginning of high prices in 1917, and that much of the property that was acquired prior to that date has since 1917 been reconstructed and replaced with high-priced material and equipment. For this reason there is little to choose at this time between the original cost of many electric properties and their replacement cost, and controversy on the subject as to the relative weight to be attached to these two factors becomes merely academic. Hence the book cost of the electric utilities may be accepted as fairly reflecting the present value of the physical plants, especially since practically all of these capital expenditures have been made according to the commissions' prescribed classifications of accounts, and the capital charges have been approved by the commissions themselves.

The decisions of public service commissions indicate what additional factors must ordinarily be added to the book cost of the properties to more nearly reflect fair values. An analysis of the decisions, of which there are a great many in the official records, shows that the average allowance for working capital is equal to approximately 3 per cent of the investment in the physical property, and capital securities may be issued for this purpose. Likewise, The United States Supreme Court has long since held that the existence of going concern value in an assembled and established utility property is self-evident, and constitutes a property right on which the owner has a right to earn a fair return when the same is dedicated to public use. This language has often been restated with approval, and in one of the most recent decisions of that court it was further said that the amount generally included by commissions and courts to cover this intangible item in the appraisal of a utility property was equal to approximately 10 per cent of the value of the physical elements.

The Protective Factor

Restating now the property investment of the operating companies in terms of fair present value as defined by the United States Supreme Court, the reconciliation of the asset value and the outstanding securities becomes more interesting. The total book cost of the property of this first group, after deducting the average depreciation that exists in well maintained properties and making allowance for working capital and going concern value according to the findings of commissions and the decisions of the United States Supreme Court, the asset value of over 50 per cent of the electric industry is $4,854,000,000 as defined for rate base regulation purposes, against outstanding securities at par of but $4,492,-

000,000. In other words, these securities have a protective factor of $362,000,000.

Even this does not tell the full story. The securities of corporations are generally, in the first instance, sold at less than par, and in addition to absorbing this discount the borrower must pay the banker's commissions, brokerage, the cost of engraving and printing securities, legal opinions, etc. The question of necessary past discounts and similar expenses may have no place in a discussion of the burdensomeness of present capitalization, but it is interesting at this point to know what such costs aggregate in ordinary utility financing and that under commission regulation these costs represent a much more modest charge than they do in private industry generally.

Sale of Electric Utility Securities Analyzed

An analysis has been made of the electric utility securities that have been sold in the United States as listed in the *Commercial and Financial Chronicle* for the last seven years, and they disclose a discount below par to the purchaser of 3¼ per cent.

A study of bankers' commissions and brokerage charges in connection with the sale of many hundred million dollars of public utility securities indicated that such items cost an additional 5½ per cent, making a total burden on the financing of utility properties of 8.75 per cent. If such cost is taken into consideration in studying the present outstanding securities, it appears that but $4,098,000,000 was realized from the securities outstanding for over 50 per cent of the operating electric utilities, and over $750,000,000 less than the valuation findings supported by the United States Supreme Court decisions and the rulings of the commissions.

These facts taken together show first, that there is no overcapitalization in this group of electric utilities and, second, that their financing has been conducted on an exceedingly economical and conservative basis.

Let me next take up the second group of utilities analyzed in this study. They embrace the electric operating properties associated with gas or street railway utilities, but still deriving from 60 to 95 per cent of their total gross income from electric services. This group comprises 74 companies, the book cost of which properties is $3,714,000,000 against outstanding capital of $3,735,000,000. Here we see on the first examination a slight margin of outstanding securities in excess of the cost of the properties as disclosed by the books. When, however, we apply to the total book cost the principles laid down by the decisions of the public service commissions and the United States Supreme Court as to the proper value for rate-making purposes, such book costs, less depreciation, but including working capital and going concern value for the second group, becomes $3,778,000,000, against $3,735,000,000, or a property value greater than the amount of the securities outstanding. There is thus no evidence of overcapitalization in this group.

If now we deduct 0.7 per cent of the book cost of the utility property included in the first group, and 30 per cent of the property included in the second group to cover the non-electric property operations included therein, the purely electric investment here analyzed and covering 269 companies aggregates $7,339,696,000. Comparing this sum with semi-official estimates of $9,000,000,000 as the total amount invested in operating electric properties today, it follows that for nearly 82 per cent of the total industry, there is no justification for the charge of overcapitalization. "But," say the critics of the industry, "your figures are not convincing. Just leave it to the accountants to make your balance sheet balance. A shrewd accountant and a smart lawyer can arrange that." Such a view is interesting and also important, but here again the facts of regulation as laid down in official reports squarely meet this issue and justify the reliance placed on the books and records of the electric utilities. The utility laws require that commissions ascertain the fair value of utility properties. In arriving at such value they must give consideration not only to the book cost of the properties but also to their replacement cost, existing depreciation, and such other evidences of value as are present in each individual case. Since these decisions definitely establish the true value of such properties through the right to earn a fair return thereon, it follows that the relationship between the valuation findings by the authorities and the capitalization provides an official answer to any inflation charge.

Analyses of commission decisions covering fair value findings of entire electric properties, and setting forth also the related outstanding capitalization, show valuation findings of over $292,000,000 against a total capitalization of $309,000,000. In this comparison the securities exceed the earning value by 5 per cent. However, the combined rate base included in these decisions reflects in a number of the early cases some exceedingly heavy deductions for depreciation, and no allowance was made in the capitalization for the cost of financing. These latter costs, as already explained, aggregate on the securities in question, over $27,000,000. After making this deduction, the proceeds realized from such securities and invested in the properties appraised, were perhaps not in excess of $282,000,000, or well below the total of the rate bases found by the authorities.

Data Are a Matter of Record

In the decisions referred to, the commission rate bases exceeded the capitalization in nearly half of the instances. In only six cases did the capitalization exceed the rate base by over 10 per cent, and 85 per cent of such excess capitalization was accomplished before the adoption of public utility laws in those states where these particular properties were located. These data are all a matter of record in the files of the State commissions and are open to examination by any interested party. It may be that the advocates of municipal ownership of electric properties sincerely believe that there is overcapitalization or inflation in the electric industry, but it is only fair to suggest that before making such charges they should first acquaint themselves with the facts.

There is also no inflation in the capital structures of the older holding companies. Thirteen of such companies publish detailed reports of their own balance sheet data, disclosing the cost of the securities which they hold and have taken out of the market and the cost of the securities which they themselves have issued. The cost of the securities acquired and held by them, that is, the 13 companies giving detailed balance sheets, aggregate $1,878,643,000, and the par value of the securities which they have issued against these properties is $1,733,000,000, showing an excess book cost of the property in the treasury of these companies of $145,000,000 over the par value of the securities outstanding. The magnitude of the operations of these 13 holding companies is indicated by the fact that the book cost of their subsidiaries is almost $6,000,000,000, or 65 per cent of the total investment in electric utilities.

While the securities held by the holding companies constitute the assets against which their own capital has in turn been issued, these bonds and shares are no part of the capitalization of the operating companies. They are in no sense an addition to the securities or the capitalization of the operating companies. When this fact is understood the holding company assumes a different aspect in the investment field, for so long as it removes from the market and holds in its own treasury the securities of other companies, and against these puts out its own securities and in no greater amount, there is no pyramiding or weakening of the capital structure of either the operating company or the holding company. Since the holding company can ordinarily acquire no securities from its subsidiaries except as their issuance is approved by the regulatory commissions of the States in which such properties are located, there is little danger of overcapitalization. There is no contact between the holding company and its operating subsidiaries that is not subject to the closest scrutiny of the regulatory commissions, and any abuse of the power control can be arrested by the commissions at its inception.

A word in conclusion. Commission regulation has successfully met every test of the soundness of its policies. The utility laws have proved strong enough to protect the public, and their administration has been sufficiently flexible to adapt them to violent economic changes. Regulation, when the occasion required, has restrained tendencies leading to wrongs and abuses, and it has been found equally competent to protect the investment of the utilities and the public they serve. Although not perfect, it has nevertheless met every problem in a manner that has justified public confidence.

It is the hope of the friends of good government and of sound business generally, that this record of achievement in public administration will be maintained. Serious problems affecting the ownership and management of public utilities are on the horizon. They can best be met through a presentation of the facts, a statement of the truths that regulation has disclosed, and the beneficial results it has accomplished. Should the influence which the commissions exercise be removed, or the workings of these bodies become influenced by political considerations, both the utilities and the public will suffer. The accomplishments of commission regulation furnish the best reason for not disturbing the workings of this branch of our State governments.

I thank you. (Applause).

CHAIRMAN JONES: I am sure that paper is a bright spot on the program of this convention. It is one of the most valuable contributions to regulation and rate discussions that I have ever heard.

MR. MARTIN J. INSULL: I would like to propose that that paper be printed in pamphlet form for distribution to our membership, providing Mr. Hagenah will give his consent.

CHAIRMAN JONES: I think that is a splendid suggestion, Mr. Insull, and I am sure the incoming President will carry out that recommendation.

Mr. Hagenah referred in the course of his remarks to the fact that this industry is now being subjected to an investigation by the Federal Trade Commission. We have with us this morning a gentleman who has been representing this Association as Special Counsel before the Commission in the presentation of its case. This gentleman is an experienced public utility man, knows our problems, and I believe knows how to present them in a proper and intelligent way.

It is now my pleasure to present to you Mr. Bernard F. Weadock, Special Counsel before the Federal Trade Commission. (Applause).

FEDERAL TRADE COMMISSION'S INVESTIGATION

By BERNARD F. WEADOCK

Special Counsel

This is a day of investigations. The present investigation of the electrical industry was instituted by a member of the minority party in the year immediately preceding the presidential election. That, however, should not in any way affect the completion of that investigation by the administrative body to whom it was referred.

It has been my pleasure to consider the Federal Trade Commission in its work as a quasi-judicial body, and I have accorded to it that position. The commission, I believe, is endeavoring to execute the command of the Senate thoroughly. The public hearings have been running for a year and a quarter. They have been presided over by the Chairman, Judge Edgar McCullough, faithfully and with some patience. The matter has been presented by

Mr. Healy, the Chief Counsel, a good lawyer and a splendid gentleman, bent upon fulfilling his duty as he views it, in the order of the Senate.

The Commission has consented to give the utilities an opportunity to present their side of this matter. The exact time is uncertain, but pending that time I would rather refrain from discussing what we propose to show out of deference to the commission itself. It would be rather unique for a lawyer to discuss the character of the evidence or the testimony that he proposes to present in a case in advance of the actual hearing.

I can say to you only this: That this investigation, it will be my hope, when it is completed, will set at rest forever the insinuations, the innuendoes and the accusations in regard to this industry. It is my hope that when it is concluded you gentlemen can devote your time to the expansion of your business and your community in your usual orderly procedure, rather than to the matter of this investigation.

I said that this was a day of investigations, and so it is. The same gentleman who introduced the resolution which brought on our investigation has but recently introduced into the Senate of the United States a resolution to investigate every industrial and commercial consolidation and merger occurring within the last five years wherein the capital involved was in excess of $20,000,000. The scope of that resolution is broad enough to include practically every commercial enterprise in the nation. It is broad enough to include all sizeable business.

I think the American people today are not gravely concerned with the magnitude of an enterprise. They realize the necessity that if this nation is to continue to go forward and the industries of it are to be successful, it must be done by a large organization because of the economies resulting therefrom, which are always beneficial to the consumer.

As usual, the electrical industry is in the fore. Our investigation comes first and the others follow. I feel that when we do present our facts to the Commission that the Commission itself, the American people and the Congress of the United States will view this industry as it properly should, and that is an industry in the fore of the progress of the nation, operated by skilled men trained in the business for the good of the country.

I thank you. (Applause).

CHAIRMAN JONES: For the information of those who were not here earlier in the session, I would like to say that the report of the Constitutional Revision Committee has already been presented and acted upon. The talkie-movie for the day has been postponed until immediately after the installation of the newly elected officers. Please stay for the picture. It is on a par with the others you have seen. Therefore, I need not urge you to remain to see this one.

We will now have the report of the Nominating Committee of the officers for the ensuing year. Mr. W. W. Freeman, Chairman, will present it.

REPORT OF NOMINATING COMMITTEE

MR. W. W. FREEMAN: Your Nominating Committee takes pleasure in submitting the following nominations:

PRESIDENT, M. S. Sloan, The New York Edison Co., New York.

VICE-PRESIDENT, W. A. Jones, Cities Service Co., New York.

VICE-PRESIDENT, J. F. Owens, Oklahoma Gas & Electric Co., Oklahama City, Okla.

VICE-PRESIDENT, Marshall E. Sampsell, Central Illinois Public Service Co., Chicago, Ill.

VICE-PRESIDENT, Edwin Gruhl, North American Co., New York.

TREASURER, P. S. Young, Public Service Electric & Gas Co., Newark, N. J.

MEMBERS-AT-LARGE, National Executive Committee, to fill expiring terms of office:

P. S. Arkwright, *ex-officio,* Georgia Power Co., Atlanta, Ga. (Class "A").

Representatives of Class "A" Member Companies for Three Years

E. W. Lloyd, Commonwealth Edison Co., Chicago, Ill.

Harry Reid, National Electric Power Co., New York.

Representative of Class "D" Member Companies for Three Years

G. E. Cullinan, Graybar Electric Co., New York.

Representatives of Class "F" Member Companies for One Year

C. L. Collens, Reliance Electric & Manufacturing Co., Cleveland, Ohio.

James R. Strong, Tucker Electrical Construction Co., New York.

Respectfully submitted,

R. J. GRAF
FRANKLIN T. GRIFFITH
C. E. GROESBECK
MARTIN J. INSULL
W. W. FREEMAN
Chairman.

CHAIRMAN JONES: You have heard the report of the Nominating Committee. Nominations are in order from the floor if you care to make any.

[A motion was made, seconded and carried that nominations be closed.]

[President Arkwright assumed the chair.]

PRESIDENT ARKWRIGHT: All those in favor of adopting the report of the Nominating Committee say "aye"; contrary "no." The report is unanimously adopted.

I hereby instruct the Secretary, Mr. Marshall, to cast one ballot for the officers named in the report of the Nominating Committee.

The Secretary has cast a ballot for the election of the officers named in the report, and they are declared unanimously elected.

I would like to ask former Presidents Martin J. Insull, J. E. Davidson and Frank Smith to escort the newly elected President to the rostrum.

[The newly elected President, Matthew S. Sloan, was escorted to the platform, the audience rising and applauding.]

PRESIDENT ARKWRIGHT: Matt, the Presidency of the National Electric Light Association is one of great distinction. Its symbol of office is a badge of honor. It has been bestowed upon you by the unanimous choice of the representatives of the electric light and power industry throughout the United States. They have known you for years, observed you, and watched you. They could not have made any mistake. They have all been looking forward to the time when you would be President of this Association. They are confident that its affairs will be handled with ability and skill and tact under your leadership.

In addition to that they get gratification and satisfaction in the feeling that, not only will their Association be well conducted under your administration, but the handling of it by you will reflect pride and credit upon each one of them.

It is a peculiar pleasure and pride to me to transfer to you the office of this Association, because the same soil from which you drew your inspiration furnished the clay out of which I am made. Your traditions are my traditions. Our people are intensely proud of your accomplishments. You are entering into this office with knowledge of the business, the head of the largest single electricity company in the world, the chief executive of the first-born among us in whom we have great pride. You take with you our best wishes for your unqualified success in this position.

You have also, as I can tell you, an amazingly pleasant and inspiring experience ahead of you when you go over the country to visit the people in this industry in the various sections everywhere, and receive from them a glowing welcome from warm hearts, and you begin to appreciate what your industry means and the kind of people that run it.

I congratulate you on having the very great distinction, the very great privilege and the very great pleasure of serving this Association as its President.

Ladies and Gentlemen, I present to you our new President, Mr. Matthew S. Sloan. (Applause).

PRESIDENT-ELECT SLOAN: I want to thank President Arkwright for the fine compliment he has given me. I am deeply conscious of the honor you have done me in electing me to the presidency of our great Association. It might perhaps have been well if some other man had been chosen, for it is no small task to assume, and I have a job in New York with heavy duties and responsibilities. However, I have been chosen and subject to those duties and responsibilities I pledge you my interest, my energy and my devotion to the affairs of our Association and our industry.

Thank you very much for electing me. (Applause).

PRESIDENT ARKWRIGHT: We will now have the feature which has attracted so much interest during the week every day. I will let the man who is responsible for having it made tell you about it. I said the first day of the session that if we had nothing else in the convention but these talking motion pictures, we would have had a convention, and we owe that in large part to Mr. Onken, who went to Europe to secure them. Before going he had an agreement from the people who would take part, but after arriving there he was disappointed in not getting any of them. With his initiative he overcame his discouragement and brought us back better ones than we sent him to get.

In addition to our obligation to Mr. Onken, I want to again express our obligation to the Western Electric Company, through whose generosity all of these pictures were provided for our interest and our entertainment.

Mr. Onken will himself present this feature.

After it is over you need not remain if you do not care to. As I said earlier, there is no surprise after it is over. It will be the last half of the ninth inning, with two out and one on the bases. You know in advance that the game is going to end, by the runner being thrown out at the home plate.

JAPAN'S TRIBUTE TO LIGHT*

BY SIR KEMGO MORI, TOKYO, JAPAN

Chairman, Japanese Committee of Experts to Reparations Conference

The event we are celebrating today is not something which can be celebrated one day and forgotten the next. You will remember it every day and forever.

An invention whose advantage can be enjoyed by only one section of the community, or the people of one country, cannot be termed a true blessing. But the electric lamp is a true blessing in the sense that its beneficence extends to every man, every woman, the world over.

I am one of those who was not so blessed in his youth. My studies were made under the oil lamp. I like to think that that time is not very long back, and it is certainly a very short time for the electric lamp to have made such remarkable progress considering that, according to the statistics I have, my country was lighted at the rate of one lamp for every two people in 1927.

No later figures are available, which fact throws into a relief, as clear as the illumination I am talking about, the rapidity of the expansion this public utility is making. Official statistics cannot keep pace with its progress.

The electric lamp has a sister, equally admired, more vocal; but less enlightened. I refer to the telephone. This lady, however, is less fortunate and is often seduced in government hands. Her virtue is not, therefore, always irreproachable.

There are three virtues which are rarely possessed combined by mortals—beauty, cool head and a warm heart. The only thing I know which possesses them is a mountain in Japan. Its name, which must surely be known almost as universally, is Fujiyama. It is beautiful in form. Its head is cool in perpetual snows, and its heart is warm with internal fires. But it has its peer in the electric lamp, which is a happy mixture of these three virtues.

Let us hope that this wonderful creation may make still further progress in the days that are to come, and in its gathering strength bring light upon the questions which trouble mankind, and in the solution of which the West and the East must join hands.

PRESIDENT ARKWRIGHT: It is appropriate that this convention should fade out with the picture, and with it fade the one who has had the honor to preside over your deliberations. I thought that I would run toward the end of it, but as the end comes I find I am approaching it with reluctant feet. I have had a wonderful experience. I have been all over the country meeting all the people in the industry everywhere. With wide open arms of welcome, with cordiality that proceeds only from the warmest of hearts, I have gained a new inspiration from them, a new appreciation of them.

I appreciate more than I can say the honor you have bestowed upon me. It has been a year to me of receiving. I have received from everybody, everywhere, and I want to express to you my very great appreciation. I will remember the experience. I will cherish it always. (Applause). I think, I think, I think it's a feeling of affection I have for you.

MR. W. W. FREEMAN: Mr. President, may I have the platform for a moment?

My excuse for asking the courtesy of the platform of Mr. Arkwright for a moment is because I am acting under instructions from the management of the Association which at this time, however, is acting without the knowledge, much less the approval, of the President. I am sure we have all been profoundly impressed during this convention with the untiring zeal and the versatility of our President, Mr. Arkwright, and the Executive Committee desires to do something this year, to present a diploma which no Past-President has ever had the privilege of receiving.

I am asked by the members of the Executive Committee and given the honor, to present to Mr. Arkwright this engraved diploma, which with your permission I will read:

"National Electric Light Association, Organized 1885, *to advance the art and science of the production, distribution and use of electrical energy for light, heat and power, for public service, hereby attests and expresses its appreciation to Preston S. Arkwright, President of the Georgia Power Company, Atlanta, Georgia, who faithfully and successfully served the electric light and power industry through this Association as its Forty-second President, July* 1, 1928—*June* 30, 1929."

The diploma is signed by the Managing Director and the Secretary of the Association, and also by a representative of the Public Policy Committee.

It gives me very great pleasure, under instructions from the members of the Executive Committee, to present in your presence this very well merited diploma to your retiring President, Mr. Arkwright. (Applause).

[The audience arose and applauded.]

PRESIDENT ARKWRIGHT: Well, I have graduated. I think I would like to take a post graduate course.

Before leaving, please let me say that I do not think I have done the Association any harm, and if I get a diploma it probably means you think maybe I might have done it a little good. If I have, then being President of the National Electric Light Association is a pretty easy job. It ought to be. I don't think I have ever experienced anywhere the consciousness that came to me from association with this industry, that each seemed to be willing to give of his best in order that all might benefit. That quality and that attitude of mind exist to a most emphatic degree in the industry. Our administration has had the united support of all the industry, in addition to which I beg to repeat that you provided before I entered the office the most excellent administrative headquarters' staff. Your Managing Director is outstanding in intelligence, in character, in high-mindedness, in purity of conduct, in tactfulness, in sincerity, in initiative, and in devotion to the industry.

---

* Presented as a "Talking-Movie."

The Secretary, Mr. Marshall, is untiring in his work. No possible detail escapes him. You can go to sleep and have a convention. You know it will be all right. You can sleep at night soundly without worrying at all. Always you will find things provided for even if you didn't think of them.

So it goes with all the heads of the departments, Mr. Oxley, Mr. Herbert, Mr. Greenwood, Major Bennion, and all the others.

If you will just let me say it, I would also like to acknowledge my personal debt of obligation to Miss M. B. Woods, Secretary to Mr. Marshall. In addition to her very extensive and active duties, she is assigned the duty of training, guiding and directing the President. She not only does that, but she makes his work a pleasure.

Goodby to you. May all prosperity come to you; all clouds of suspicion be blown away from you, and your real sincerity of purpose be manifest and believed in by the people you serve so faithfully. Goodby. (Applause).

The meeting adjourned at 1.05 p.m.

ACCOUNTING NATIONAL SECTION SESSION

ACCOUNTING NATIONAL SECTION SESSION

TUESDAY, JUNE 4, 1929

[The meeting convened at 3:15 p.m. in Westminster Hall, Hotel Chelsea, Atlantic City, N. J., Mr. J. F. Ford, Chairman of the Section, presiding.]

CHAIRMAN FORD: In arranging a program for a session such as this we are having this afternoon, I had hoped to be able to call upon the various chairmen of our Standing Committees to report in person their activities and accomplishments of their committees during the year, but since time is limited and your chairman is supposed to give an accounting of his stewardship, I will endeavor to briefly summarize the activities and accomplishments of the various committees and the Section as a whole.

The Accounting National Section year 1928-29 is gradually drawing to a close. During the year many problems have confronted us and I feel that this Section has not been found wanting and has met the demands made from the many sources.

I feel that the secret of what success the Section has had has been due principally to the chairmen and the personnel of the various standing committees. I do not believe that any of my predecessors have had any more active or enthusiastic committee workers than has been my good fortune to have.

Some idea of the outstanding accomplishments may be gleaned from the following brief summarization of the activities of the various committees.

The first of which is the Classification of Accounts Committee, Mr. H. C. Hasbrouck, Chairman. I am going to ask Mr. Hasbrouck if he will stand up so everybody knows him.

[Mr. Hasbrouck arose. Applause.]

While this committee cannot point definitely to the adoption of the Standard Classification by any State regulatory commission which had not adopted it prior to the current year, however, very definite progress has been made. Two States have gone into the subject to considerable extent, one of the States having held a hearing, and indications are that it will only be a matter of time before the Standard Classification is adopted by the regulatory commissions of these two States.

The committee has been called upon to answer a number of questions throughout the administrative year, many of which have been on interpretation and undoubtedly have been of real service to member companies.

The committee has had two special problems on which they have been working, namely, Accounting for Merchandise and Jobbing activities, and Interconnection Accounting. Progress has been made and completed reports will be published in the near future.

Our next committee is that of the Customers' Records Committee, Mr. Douglas Brown, Chairman. Mr. Brown, will you stand up?

[Mr. Brown arose. Applause.]

This committee, always one of the most active of the Section due principally to the large field in which they have to work, as usual has been extremely busy.

Particular attention has been devoted to three subjects: Machine Appliances in connection with Customers' Records and Accounts; What the Customers' Departments of Some Companies Have Done to Promote Good Will, and Final Bill Procedure.

Several serial reports have been published; two more are in the stage of completion and ready for publication within the next month.

Fixed Capital Committee, of which Mr. J. A. Rockwood of the Pacific Coast is chairman, and he was unfortunately unable to be with us, and I am going to ask the Vice-Chairman, Mr. T. M. Ford, if he will stand up.

[Mr. Ford arose. Applause.]

Here again we have a committee that has been extremely active. Four serial reports are ready for publication and three others will be published in the near future.

The work of the committee for the past year has been largely devoted to the study of practical questions involved in carrying out a system of Fixed Capital Records. These studies have been summarized in a group of serial reports which have been authorized for publication as follows:

Fixed Capital Records for Insurance and Taxation Purposes
The Practical Application of Fixed Capital Records for Fire Insurance
Turbo-Generator Units, Steam
Accounting for Fixed Capital Under Joint Pole Agreement.

Further study of detailed methods of Fixed Capital Accounting with the thought in mind that eventually all classes of property have been suitably covered.

General Records Committee, Mr. K. B. Crumb, Chairman. Mr. Crumb, will you stand up?

[Mr. Crumb arose. Applause.]

This Committee, while comparatively new in the Section, has accomplished wonderful results. Two serial reports have been prepared, namely, "Filing Corporate Documents and Automotive Equipment," "Accounting Practices and Records, Suitable for Smaller Companies." The first was published in May.

A study is also being made to determine the extent to which machine systems and methods for general books and records have been developed. Information as to systems now in use was requested from a number of member companies and a tentative report has been prepared on the statistics thus obtained. This report when published will be entitled "Statistics of Machine Accounting Systems for General Books and Records."

Statistics Committee, of which Mr. Harry A. Snow is Chairman. Mr. Snow was unable to be here today and I am going to ask the Vice-Chairman, Mr. E. J. Fowler, if he will stand up. Evidently he is not here either. However, the work of the Statistics Committee for the fiscal year of 1928-29 has been centered on improving, extending and accelerating the collection of data by the Statistical Department of the N. E. L. A. Headquarters and in supervising the publication of the compiled results.

Upon assuming its duties at the start of the year the Committee found that there were a number of important companies which were not reporting regularly to the Statistical Department. They also found that many of the member companies were very slow in sending in their reports, and that certain items called for by the report forms were not being supplied by the reporting companies, particularly the data requested on the Sale of Energy to Farms.

The Committee at once undertook to improve this situation. Securing the appointment of the chairmen of the several Geographic Statistics Committees, the National Committee forwarded to them lists of delinquent companies, soliciting their cooperation in securing or hurrying up reports from the delinquents. Pressure was also brought to bear through the personal acquaintance of the members of the Committee with officers of the delinquent companies.

During the year, the Statistical Department at Headquarters, with the advice and the assistance of the Statistics Committee, inaugurated the publication of National Statistics for the Industry in the N. E. L. A. BULLETIN, which is issued regularly each month. The Committee plans to continue the monthly publication of Statistics for the Industry, and it has hopes that these statistics will assume rank with other important economic indices such as the regular reports of railroad car loadings, and of unfilled orders of the U. S. Steel Corporation, which form so important a part of the current information on economic conditions.

Budget Committee, of which Mr. B. S. Rodey, Jr., is Chairman. Mr. Rodey, will you kindly stand up?

[Mr. Rodey arose. Applause.]

For a number of years the Budget Committee was a Committee of the Accounting National Section. Several years ago, due to the varied nature of the work, it was decided to make this a National General Committee. It was felt advisable, during the past year, for the Accounting Section to again take over this Committee, and with the approval of the National Executive Committee work was started and while the year was well under way before the Committee was organized, they have nevertheless been very active and studies are being made on the following:

1. a. The functions of budgetary control in modern electric utility management.
   b. Outline of procedure for development of long term forecasts.
2. Study of the National Budget System and suggested plans and its possible application to budgets in electric utilities.
3. Relative purpose and use of budget period in electric utilities.

At this time two serial reports are in process of preparation and it is expected that they will be ready for publication within the next six or eight weeks.

Corporate Finance Committee, of which Mr. Oliver McCormick is Chairman. Mr. McCormick, will you kindly stand up?

[Mr. McCormick arose. Applause.]

For policy reasons and for question of jurisdiction, it was decided that this Committee act as a standby Committee to take up subjects as may be submitted and approved from time to time.

The next Committee is that of Purchasing and Storeroom. Mr. Wilbur G. Young, Chairman. Mr. Young, will you kindly stand up?

[Mr. Young arose. Applause.]

Here again is one of our unusually active Committees. To date, the following serial reports are complete:

A Review of Public Utility Salvage Methods
Receiving and Inspection of Material in the Stores Department.

Considerable work has been done on several other subjects, none of which, however, are ready to be released by the present committee. They have, however, recommended that the subjects be considered and finished by the succeeding committee. These subjects are:

1. A Revision of Existing Classification of Materials and Supplies
2. Unit Piling
3. Storeroom Statistics
4. Allocation of Cartage charges on Stock Material and Supervision of Employees and Equipment Engaged in Such Work.

Another, and not by any means the least active Committee, is that known as the Exhibit Committee, of which Mr. E. S. Brock is Chairman. Mr. Brock, will you stand up?

[Mr. Brock arose. Applause.]

Two years ago it was decided to hold an exhibit in connection with the Accounting Section at the Convention. The idea was advanced just shortly before the Convention which did not permit any too much time for preparation.

The purpose of this exhibit is to display forms used for various accounting functions and to have in attendance members of the various Committees for the purpose of round table discussions and for answering questions of the delegates. The results undoubtedly warranted the time and effort put forth so much so that this Committee was organized again at the beginning of this administrative year with the thought in mind that they would be in a position to collect information and data throughout the entire year. The work which has been accomplished has been most remarkable.

At one of the group meetings of the Section in Chicago, this Committee arranged for an exhibit of mechanical office appliances which was of untold value and of interest to everyone in attendance. The Committee has prepared, as most of you know, an exhibit here at the Convention and no one can afford to leave the Convention without having paid a visit to this exhibit.

They have also arranged through the courtesy of the Atlantic City Electric Co. for a practical demonstration of a machine accounting system. This demonstration will take place at the office of the Atlantic City Electric Co. at Baltic and Kentucky Avenues, on Thursday afternoon, June 6, between the hours of 2 and 5 p.m. Cards of admission will be necessary and can be secured at the Accounting Section Booth at the Convention Hall.

From time to time there has been some criticism that too much time was being devoted to work on Committees and the question asked just what is accomplished. I believe that everyone gets out of his or her work on Committees many times more than they put in it and the benefits that are derived from Committee activities accrue to the companies as well as to the individuals, otherwise member companies would not sanction the time and expense involved, and I am sure that our Section and the committees give to those who take an active part therein a broader vision and an enthusiasm that is essential in the development of ideas.

I want to take this opportunity of publicly thanking the officers, members at large, chairmen and personnel of Committees, as well as the Geographic Division Members, for the loyal and hearty support accorded me during my administration which is nearing its close.

In conclusion permit me to ask what better means has this great industry of ours for developing and improving its accounting systems than through the medium of the Accounting Section where the interchange of ideas is a constant source of improvement which otherwise would probably remain undeveloped.

That is all you will have to hear from the Chairman of the Section. (Applause).

According to the Constitution, Section 6, it is the duty of the Chairman of the Section to appoint at the first session or the beginning of the first session, a Nominating Committee, and the duty of this Nominating Committee is to select the names of 15 members of the Section or Association and report later at the Session just prior to the adjournment. This Committee that I have appointed is as follows:

Mr. C. M. Breitinger; Mr. E. A. Davis, Mr. W. Paxton Little; Mr. W. C. Lang.

Mr. W. B. S. Winants, Chairman.

This Committee will report just prior to the adjournment of this meeting.

We will now hear from one of our speakers on a subject which I am sure will be of interest to everyone in attendance here today and would also be of interest I believe to every delegate attending this Convention. His subject is "The Professional Motive in Public Utility Management." I don't know of anyone who would be better able or more qualified to talk on this subject than our speaker who is Assistant Dean of the Harvard School of Business Administration. He is also co-author of a text book on Problems in Utility Management. It is my pleasure and privilege at this time to present to you Assistant Dean of the Harvard School, Deane Malott. Mr. Malott. (Applause).

THE PROFESSIONAL MOTIVE IN PUBLIC UTILITY MANAGEMENT

By DEANE W. MALOTT

Assistant Dean, Graduate School of Business Administration, Harvard University

I ask you in the next few minutes to back away from the accounting and administrative problems with which your profession must abound—to retreat so far that the figures of your operating statements and balance sheets fade into oblivion—in order that we may take stock of the direction of your progress and examine the far horizons toward which this great electric industry, in common with all American business, is heading.

The newspapers today are filled with criticisms and suspicions, and a certain amount of fear, that the electric light and power companies have become a species of diabolical octopus, which will get out of control and choke the very life of our nation. There are charges of corruption and propaganda, of enormous profits, inflated security prices, and selfish manipulations.

Yet I lay aside my evening paper to switch on the radio, bringing entertainment from distant cities. I note the convenience, the luxury of electric refrigeration, the electric cooker, washer and ironer, which bring to my family the opportunity of a richer life—and all at a price which I must be willing to pay, or I would not have these conveniences. I am not forced to have them, for with the exception of electric lighting, there are substitutes in direct competition for all these services.

From the telephone at my elbow, I can reach any one of millions of individuals, for I am told something like 80 per cent of the entire world's telephones are at my immediate service. I ride through the country late at night and see the twinkling windows of isolated farmhouses where inside are the comforts of electric lights and other domestic appliances, where the families are served by electric motors for pumping water and doing a dozen other tasks which provide the farmer with greater comforts and easier living. There must be something peculiarly dynamic in these utility industries, something of lasting worth which gives prophecy of even greater service in years to come. Somewhere in the industry constructive imagination of a high order has been at work.

Corruption and Business Ethics

I do not say that there has not been corruption, unhealthy propaganda and short-sighted self-interest. Undoubtedly there has been, for I have observed that these elements are an inseparable part of every rapidly growing and prosperous industry. But it seems unlikely that an industry of such size could have arisen with these as the dominating motives. Largely the development of public utilities has been through the corporation, a type of organization which, contrary to popular conception, inevitably tends toward higher ethical standards, with more of a feeling of trusteeship for the public which it serves as well as for the employee and the security-holder. The big corporation stands for stability and permanence rather than for rapid and immediate profits. It is easy for one man, in a little shop around the corner, to engage in sharp practices. It is far different in a corporation where the individual executive is surrounded by associates whose respect and trust are necessary to his existence. For these corporations are no longer controlled by a few men, nor by bankers. The ownership shares are scattered throughout the land, just like autos or electric lights.

In spite of this, considerable uncertainty seems to exist as to the motives of this industry. A part of the uncertainty is the result of a mistaken idea. prevalent both in and outside of the field, that there is essential antagonism between the public on the one hand and the utility operators on the other. A wall has been reared between the two, over which the two sides are making faces at each other. This feeling has tended to aggravate itself in the attempt occasionally made by the utilities to extort a monopoly profit by charging a high unit price for their services. Enlightened economic study, however, has shown that the ideal should be not a high price with resulting high unit profit, which restricts the business, but a low unit profit, which will result in a high aggregate profit. Your business is subject to two definite economic laws. One is the law of diminishing costs; the other of elasticity. The first indicates that unit cost decreases as volume increases. The second indicates that volume increases with a decrease in unit prices. Sound practice, therefore, calls for abandonment of the attempt to collect a monopoly profit, which results in a high unit price on a restricted output, because your aggregate profit will be greater if your prices are cut to the limit. You may have seen instances within your own experience of this sort—where price reductions have led to increased consumption and increased profits —but the courage to follow this policy has been all too rare. The Hartford Electric Light Company has recognized these facts with notable success. And, after all, there is nothing in the world more obstinate than a fact.

Barrier Wall Disappears

With these economic concepts clearly understood, the barrier wall between utilities and the public largely disappears, and what is good for one is also good for the other. If the utilities' profits result from decreasing price, it is inevitable that the public, as well, receives a profit through the revision.

Europeans tell us that Americans are materialistic, money-mad, ruthless. Hence we have developed sordid tendencies toward the aggregation of wealth which have precluded any finer sensitiveness, and our foreign critics say as a result we have developed no great artists. But are the great business leaders so far removed from the great artists? The artist is one who visualizes the unseen, then through his ability turns vision into reality—on canvas, the printed page, in marble or in music. Great business men likewise bring dreams to reality. James J. Hill as a boy, sitting on a packing case on the muddy banks of the Missouri River, dreamed of a great Northwest, and he made his dream come true. Theodore N. Vail dreamed of a universal telephone service, and the dream which he projected is reaching fulfillment. Are not these the qualities of the artist—to see things which no one has ever seen before, and then with rare force and vitality to convert the vision into reality? Undoubtedly these business leaders—and you have them within your own industry—have the same powers as the artist, though they apply them to a more obstinate material.

Evolution Is Supreme Law

But you say these business leaders have now "arrived"; they have succeeded. Why worry about them at all, for life can hold for them no more. No, that cannot be, for evolution is our supreme law. We live in a dynamic, not a static, world; there must be continual change. A professional motive must be found, is being found, I think, to carry these leaders onward. No victorious army ever went into camp, with never another campaign to fight, that it did not at once begin to disintegrate. Under these conditions leadership is impossible.

American business today is at the crossroads. We have mastered the technique of it, developed mass production and mass distribution beyond the point where they have ever been developed in the history of mankind. The development of business with a material aim—the aim of mere size and for a mere profit—cannot go much further. And when the aim of business becomes merely to hold on to what we have, the end is in sight. In the early stages of individual leadership, there comes the desire for individual wealth. It is easily satisfied, and a surfeit of money does not bring satisfaction. In "Dodsworth," Sinclair Lewis' latest book, this is portrayed forcibly—almost tragically. Then comes the desire to build up a big business, to dominate through sheer size, and still there is no lasting satisfaction. There must come forth, not a materialistic aim, for that has been attained, but a new, an ideal aim to serve as the objective of progress.

Already we are beginning here and there to see some signs of it. Let me quote from the annual report for 1927 of the American Telephone & Telegraph Co., a company which has certainly reached nearly the zenith of materialistic progress and which dominates the field in its own industry:

"The American Telephone & Telegraph Co. accepts its responsibility for a nation-wide service as a public trust. Its duty is to provide the American public with adequate, dependable and satisfactory telephone service at a reasonable cost.

"Earnings must, of course, be sufficient to permit the best possible telephone service at all times and to provide a reasonable payment to stockholders with an adequate margin to insure financial safety. Earnings in excess of these requirements will either be spent for the enlargement and improvement of the service furnished, or the rates charged for the service reduced. This is fundamental in the policy of the management."

Ideals of Business

Certainly this is the beginning of a publicly announced ideal aim, which will continue the telephone industry's development and prevent a "victorious army" from going into camp.

With this sort of attitude there will develop in this country a body of business men held together by a professional *esprit de corps*. This professional motive is not new—it has dominated many of the older professions for centuries. In the early ages we find it fiercely alive in the religious leaders—Francis of Assisi, Loyola, St. Dominic. There was a considerable measure of it in the early military leaders, such as Charlemagne and Frederick the Great. The old-time conquerors were nearly all constructive statesmen. It is new only in application to business which has developed from a means of livelihood to stand for service to the community.

Among men who have vigorous, adventurous lives we have always found a strong tradition, an idealism, which has carried them to their objectives with irresistible force. The men who have followed the sea have been held together by strength of tradition, by an idealism which makes the captain the acknowledged leader. He tolds his place by respect rather than force. The great men who followed the sea built up the tradition, which in turn served to bolster up the weaker men—a phenomenon no less true in the business world.

In the novels of Joseph Conrad we see the domination of the captain's honor—more important to him by far than his life. In the story called "Typhoon" we see the traditional professional motive, which never presents alternatives, but drives straight for its objective.

Captain MacWhirr, in appearance an insignificant little runt, is on the deck with Jukes, his mate, in a storm at night which shakes the crazy old steamer from stem to stern. As Conrad tells it, "While Jukes was exchanging explanatory yells with his Captain, a sudden lowering of the darkness came upon the night, falling before their vision like something palpable. It was as if the masked lights of the world had been turned down. Jukes was uncritically glad to have his Captain at hand. It relieved him, as though that man had, by simply coming on deck, taken most of the gale's weight upon his shoulders. Such is the prestige, the privilege and the burden of command.

"Captain MacWhirr could expect no comfort of that sort from anyone on earth—such is the loneliness of command."

Later on, and the ship "was being looted with a senseless, destructive fury; trysails torn out from the extra gaskets, double-lashed awnings blown away, bridge swept clean, weather-cloths burst, rails twisted, light-screens smashed—and two of the boats had gone already. They had gone unheard and unseen, melting, as it were, in the shock and smother of the wave. It was only later, when, upon the white flash of another high sea hurling itself amidships, Jukes had a rapid vision of two pairs of davits leaping black and empty out of the solid blackness, with one overhauled fall flying and an iron-bound block thrashing in the wind, that he became aware of what had happened within about three yards of his back.

"He poked his head forward, groping for the ear of his commander. His lips touched it—big, fleshy, very wet. He cried in an agitated tone: 'The boats are going now, sir.'

"And again he heard that voice, distinct and faint, forced and ringing feebly, but with a penetrating effect of quietness in the enormous discord of noises, as if sent out from some remote spot of peace beyond the black wastes of the gale; again he heard a man's voice—the frail and indomitable sound that can be made to carry an infinity of thought, resolution and purpose that shall be pronouncing confident words on the last day, when heavens fall and justice is done—and it was crying to him as if from very, very far: 'All right'."

Behind those two words was the leader of men, impregnable in his duty. Apart from the ego-centric fears which break the weaker men, MacWhirr sees his duty, so clearly bound up in the tradition of the sea—and no danger of the physical universe can daunt him.

The Sporting Instinct

But, you say, that is not real, that is only a blind tradition, the sporting instinct. It may be a blind faith, a creed, but there are parallels. The doctor with his professional ideals, the business man, urged far beyond the point of perishable financial success, keeps on. Mr. Ford started as a tinker. He made a car, which became successful, dominated the market, and he became tremendously wealthy. Did he stop? No, because his ideal was unattainable, infinite. He visioned a cheap and a respectable car within the reach of everyone. That dominating motive drives him on.

Men everywhere, who are in positions of leadership, have come to make their ideal greater than themselves. It is a question with them of what is right, what will contribute most to the permanent welfare of the community. There are exceptions, of course, but if you look at the truly great leaders you will find their goal has absorbed even their interest in themselves. Thomas Edison, another whom you honor at this convention, long ago forgot himself in the pioneering efforts which absorbed his life. With perhaps unattainable ideals of what may be done, Mr. Edison keeps on.

Great problems confront these leaders and press for solution on every hand. An individual may want to contribute the maximum service, to do what is right, but the decision calls for rare judgment. Owen D. Young, in discussing the Golden Rule in business, says: "When you discuss what is right in business, the difficulty lies not in determining what is right in principle. It is rather in the application of the principles to the vast, complex problems of our modern business. If you ask me with reference to business what is right in principle, I answer that the Golden Rule supplies all that a man of business needs. Yet if you ask me to apply the Golden Rule to bank rates I find it amazingly difficult to do. It is like telling me to apply the multiplication table to the design and manufacture of a steam turbine. I know that principles of mathematics underlie the building of that great machine, but it is a highly difficult problem to step from the multiplication table to the steam turbine.

"What is right in business requires, in highly complicated situations, that the Golden Rule be applied by men of great understanding and knowledge, as well as conscience."

And along with the trusteeship for business itself, our leaders are faced with a great social responsibility. In the midst of materialistic surroundings such as the world has never known, clear-sighted vision and tremendous effort are required, if we are to avoid becoming so highly geared in our physical activities that we lose our sense of poise, our sense of spiritual values. Business leadership must very nearly assume responsibility for our civilization itself if our upward evolution is to continue. Loss of these values, of a necessary perspective, has caused civilizations in the past to disappear. Who will assume the responsibilities of leadership, so greatly needed to maintain the balance? When we look to our ministers, our standard bearers through the centuries, we find them top-heavy with dogma, the issues often obscured with a resulting loss of faith on the part of men and women everywhere. The lawyer, formerly the leading citizen, has devoted his abilities so largely to business interests that he is often no longer the leader of affairs—a position which he occupied back in the days of the village squire. The doctor is involved with the great problems of physical ills; the teacher is too often a lonely man, in an air-tight compartment, who fails to get a universal picture of the world's problems.

Responsibility of Business Men

Who is left? Only a large group of business men, run-of-the-mine and unimaginative, with here and there a great leader. So often the business man has not been urged by professional motives. Self-interest has been his only aim; and he leads his life, busy as a toad under a harrow, agile, but unwitting and ineffective.

Not all men, indeed, are fitted for this new leadership. Some never get into the ephemeral realm of values, which cannot be measured any more than one can define a beautiful sunset, or a human emotion. One man would drive the horses of the sun. Another is happy driving a push-cart. I have heard of a Harvard graduate who tried many occupations without success, and who finally found happiness as a street car conductor. Some think they have found their ideal, when they are merely chasing butterflies.

The very intangibleness of leadership and the professional motives which dominate it keep many from entering its realm. To him who does, however, that same intangibleness gives a thrust to his activity, which drives over mere tangible obstructions; for the professional motive is dominated by an almost mystical faith, where the end of the road is hidden; yet progress is the compass by which the journey is known and charted.

The Professional Motive

The professional motive is something bigger than the individual who possesses it, something outside of him, which takes possession of him and absorbs him in its inspiration. He acts freely, not under compulsion as a slave or a man with a vicious habit. He willingly and gladly stakes his property and his comfort. It caused a brilliant medical man to spend his life among the Kentucky mountaineers in comparative poverty; it caused a business man to give up a splendid position to become a college administrator; it caused a man like Munsey at the end of his life to give his millions to art; and it has caused many a man so to devote himself to his business, so to apply his energies, as to fulfill his dream of a business of maximum service to the community. The sporting element is always present. The professional motive does not calculate, does not weigh chances and risks like a bookmaker at a race or a cockfight. The professional man plants his feet upon a law of the universe, a great ideal, and defies chance, accident and fate.

Charles W. Eliot, one of America's keenest observers of human nature, once wrote: "The gypsy in Asia Minor makes iron nails one at a time with hammer on an anvil, much as his ancestors did before him for hundreds of years. I have seen him doing it; but I also observed that his small children were stark naked and that his larger ones had only one garment. . . . In industry and commerce all things are become new."

The one tradition, therefore, which we should hold inviolable, is the tradition of constant change. It will inevitably lead in the great industry which you represent, to the adoption of a professional motive on the part of your leaders—a motive which will still further develop your service and aid in raising the level of our nation. (Applause).

CHAIRMAN FORD: I have thought many times in the past year that we have had every reason for having a most successful Accounting Section year, with the enthusiasm and hard work of our chairmen and members of the committees, and the loyal support of my predecessors. In addition to that we have had as President of our Association this year a man who has always been a very staunch rooter and a loyal supporter of the Accountant. He has in his talks throughout the country stimulated interest in our Accounting Section activities. I refer to President Arkwright. He is here with us today, and I am sure we will all feel honored in having a few words from President Arkwright at this time. (Applause).

PRESIDENT ARKWRIGHT: Ladies and Gentlemen: I am very much pleased to see such a large meeting of the Accounting Section. It verifies what we believed to be true: that if an opportunity were given people to attend the sectional meetings they would come. If they have been smaller in the past it has not been because of a lack of interest in the subject, but because of a lack of opportunity to come.

I think we are going to have, and we are having, a very wonderful convention. I have had so many of my friends meet me on the boardwalk and say, "Arkwright, you certainly are getting the breaks." I guess they think that the President likes to have a good convention. Certainly, he does. So they say, "I think you are getting a wonderful lot of breaks."

"Breaks—what are you talking about?" I say.

"Well, the Hall down yonder."

"Well, what else?"

"The Fiftieth Anniversary of the 'Lamp.'"

"What else?"

"Well, the fine weather you are having."

You don't call those accidents, do you?

Why, they have been building that Hall down here for three or four years, and we got it ready just in time for this convention as the first one. You don't call that an accident. That was designed, and if you don't believe it was designed, how do you account for its being located on Georgia Avenue? (Laughter and applause).

And then about the light. You know the Lord knew that I was going to be President of this Association in 1929. If He knew anything—and He knows everything—He knew that (laughter), and He had Edison invent the lamp in 1879 so we would have a Golden Jubilee when I got to be President. (Laughter.) No accident about that. That was planned, predestined. The Lord takes care of His own. (Laughter).

They say, "Well, about the weather."

I say, "That is not an accident, either. If it doesn't rain, if it holds like this the balance of the week it will be the first week in the year 1929 that it didn't rain all week long." (Laughter.) I know the rain falls on the just and the unjust alike, but I tell you, the bright, clear sunshine for a whole solid week shines only on the just. (Laughter.) So it is sort of cherished up at the end of the year to make up for the troubles we imagine we have, to sort of take out the worries and the wrinkles and dissolve the cobwebs. To let us feel that there is hope and there is reward in good work no matter what people may happen to say about us.

Records Are Essential

I saw it stated by some accounting firm that there couldn't be a decent, successful business executive that didn't have an understanding of accounts. I think that is so. He can't control one of these businesses. They have grown too big. You can't know them all. You can't keep all of the revenues in your own pocket and count up what you have got left at the end of the day and tell how the business is going. It can't be done that way. They are too big. You have got to keep records. You have got to know what the expenditures are. You have got to know what the history of the business is, if you are going to forecast what you have got to have in order to meet the demands on you to keep your business growing.

"I Can't Understand Figures"

I had a rate case once. I pulled a bone in it. It went to the Supreme Court of the United States. It was decided at the same time as the Bluefields Water Works, at the same time as the Southwest Bell case. Justice Brandeis rendered the decision, it is true, but if you can distinguish it between these other cases I will give you this badge, as much as I prize it. It is indistinguishable, directly contrary to them. I want to tell you why we lost it. We had a fine lawyer, a big-brained fellow, forceful, sound fundamentally, a fine speaker and advocate with deep understanding.

He argued that case, and I went to him and tried to explain it to him, and had a lot of figures that somebody had explained to me, and he said, "Oh, I can't understand figures, I can't understand figures."

I said, "If you can't understand figures you can't understand rates. If you can't understand accounts, you can't conduct business. It can't be done."

I talk so much about this business, myself, the wonderful steam stations, beautiful water power plants and fine public relations, interesting the public. I want to render them a useful service, but do you know we are not in business to build magnificent water power plants or fine steam stations. That is a part of our business, yes, a part of it. That isn't the object of this business, to have stations we can brag about. We are not in business to lay out fine transmission lines. That isn't the motive that got us into this affair.

Why, I have seen treasury departments who think the purpose of the business is not to take any risks, so they never will have an uncollected account. (Laughter). That is very nice, but that isn't what we are in business for, to keep from losing money, I mean a little money sometimes. Of course, we can't lose it on the average, but that isn't the primary purpose of this business. We are not in business to be loved by the public, as much as we need their help and support. We want to render a useful service. We want to give value received and brimming over for what we get. It is a great delight and pleasure and a function of our business, a stimulant to it, but it isn't our motive. We are in business to get net earnings (applause) and we have got to get net earnings in order to render the service. We have got to have net earnings in order to raise the new capital to make the necessary extensions, to give the additional service necessary to the growth of the territory. We have got to do it. We have got to have net earnings in order to build nice-looking power plants, modern, efficient and economical. We have got to have net earnings to get the capital to build the interconnected transmission systems that take our service everywhere, the little town, the big farm and crossroad settlements. It is as much in the public interest that we should have adequate net earnings as it is in our own.

We can't get net earnings in a slipshod-run concern. We can't get net earnings with our moneys wasted. We can't get net earnings ignorant of what things cost us. We can't get net earnings or fulfill our commercial possibilities without knowing what the territory will yield to us or whether the business can be run at a profit, and we can't run the business and get net earnings or build plants or render good service until we have accountants and accounting systems. So I say accountants are fundamental to the business.

I don't think that we fulfill our duty if we run a business wastefully, we run it shiftlessly, we run it without proper control, we let the people waste our money here and there and spend it without proper records—why, that business would die and fulfill no longer any useful function. Of course, anybody that is interested in the success of this business and interested in making the business able to meet the need for its service, is bound to be interested in accountancy so there can be no possible question about it.

You know, we are growing rather large in our various communities. Most of us are the largest institutions in our respective territories, outside of the very largest city, perhaps. There is a danger in it to some of us if our companies are so big that we think we can do what we want to. I say that no company can ever grow big enough to impose on anybody. I don't care how much apparent power it may seem to have, that mere size may give in other businesses, it doesn't and cannot in this business give power to impose. It is regulated. It is run by permission, by public sentiment, because our very life is dependent upon the continued confidence of the public, so that we may never impose, we may never grow large enough to abuse the power of size, and therefore there isn't the same danger in our size that there may be in the others, but there is to the individual who thinks he has a powerful company behind him so that he can trespass and run over somebody else.

I didn't come here to make a speech. I came merely to bring the badge of the office of President of the Association to the Accountants' Meeting, to let you know the regard in which the whole industry holds its accountants, and to convey to you the appreciation we have for the work you have done in past years, and for the work particularly that you have done this year. (Applause).

CHAIRMAN FORD: The Convention or the Program Committee that has to make the plans and arrange for a meeting such as we have here today are so often confronted with many disappointments. That has been true of our committee. I believe that if we had been able to secure all of the speakers we endeavored to secure we would have an audience or an attendance that would more than have filled the auditorium in the Convention Hall, where the exhibits are now. These disappointments happen up to the last minute, so this is true of our next speaker. While he is here at the convention, he is, unfortunately, not in the best of health today. However, our disappointment sometimes brings us good fortune. I think that is true today. Fortunately, our next speaker had prepared his talk, and he has sent in his place a substitute, one of his very able assistants, and one of our most loyal workers and a past chairman of this Section. I am now going to call on Mr. W. B. S. Winans to present the next talk. Mr. Winans. (Applause).

MR. W. B. S. WINANS: When I left my home to come to this Convention I congratulated myself that I would have no official duties. Instead, I find myself trying to act as a substitute for Babe Ruth, Mr. W. A. Jones.

In talking to Mr. Jones this morning he asked me to convey to you his regrets at not being able to be present, and to tell you that he still retained his interest in this Accounting Section's work. You will remember that he was at one time the Chairman of this Section. He also asked me to tell you that the only thing that prevented him from getting out of bed and attending this meeting was the stubbornness of two doctors and one wife. (Laughter).

Fortunately, Babe Ruth left his bat with me, the speech which had already been prepared. I will read it to you.

THE ACCOUNT AND MODERN BUSINESS

BY W. ALTON JONES,

First Vice-President, Cities Service Company, New York

There was recently published in the city of Madrid an accountant's report of the cost of the discovery of America. This accounting, which was taken from documents discovered in Genoa, disclosed that Columbus spent a total sum of $6,000 in his first voyage across the Atlantic. A prominent American newspaper in commenting on this accountant's report concludes that the return on the investment has been "pretty fair," and I think that most of us here would be inclined to agree with this conclusion.

It is interesting to note, however, that a resident of Philadelphia has raised a question as to the wisdom of the venture and the amount of profit, if any, which has resulted. This Philadelphian points out that, had the $6,000 been placed out at interest in the year 1492 and the interest compounded at fair rates, the present value of the $6,000 would be $500,000,000,000. He further observes that, from what he believes to be reliable records, he finds the estimated wealth of the Americas is something like $400,000,000,000. We might, therefore, conclude that from a dollars and cents viewpoint, Columbus' voyage was not a success, and the resultant accretion of capital has not adequately compensated for the great hazards of the undertaking.

I would not suggest that this Accounting Section undertake now to settle any controversy with respect to the wisdom of Columbus' voyage to America, for I am sure the controversy would be long drawn out, and, even if it were finally decided beyond a reasonable doubt, I would question the value of such determination to the light and power industry. The fact is that 437 years ago Columbus did prevail upon Queen Isabella to finance this expedition, and according to the records he spent $6,000 in his undertaking. Whether this money was wisely spent or not is "water over the dam."

Accountants Busy 500 Years Ago

It is, of course, of some historical interest to accountants to learn that 500 years ago accountants were employed and careful records kept of business undertakings. If we delve into the pages of history, we find that even before the time of Columbus the accountant had a place of more or less importance in the scheme of things. Almost from the dawn of civilization accountants were used, and, while in the early days their methods were crude, they did exist and served a useful purpose. Long before the time when there was a business institution in the modern sense of the word and, in that period when men engaged in only two lines of endeavor, agriculture and war, there was need for accountants to reckon the number of men and the amount of property so necessary to the propagation of war.

It is a far cry from the duties and functions of the accountant or keeper of records of ancient times to the skilled student of accountants and economics so necessary to the conduct of modern business.

This 20th century in which we live is the high-speed age of history. Each new day sees a new record established in the speed with which we may travel from place to place, the speed with which our mail is carried from one point to another, the speed with which the human voice is transmitted from one country to another, and, above all else, the speed with which a business transaction may be conceived, financed and consummated. Sometimes we look upon these new speed records in the abstract, with little thought of how they will directly affect our business. But sooner or later we must gear ourselves up to these modern speed trends, or we fall behind in the march of progress.

The Speed of Modern Business

Time was when a business man went about his business in a leisurely fashion, weighing and deliberating, considering and debating, calculating and reconsidering as to how his proposed business venture could be brought to fruition without the loss of his original capital outlay. This day in which we live, however, is one of quick decisions, for we often see a business venture conceived, financed and consummated in one-tenth the time which a business man of other days took to weigh such an undertaking. This speed in modern business is not always accompanied by carelessness or increased business hazards for in most industries worthy of the name of a business organization the machinery is "tuned in phase," and with the new tools we have to work with it is possible for business executives to give thoughtful and careful consideration to problems in a shorter period of time than was dreamed of a hundred years ago.

These new tools of modern business are numerous, and each has its respective value. Among these tools might be enumerated modern office machinery, highly trained specialists, carefully trained research departments and certainly as not the least important of all, I would list the modern accounting methods.

I use the word "accounting" here in its broadest sense. A limited definition of the term, such as "keeper of records," has no place in this discussion, for I believe the time has long since passed when the successful business executive can afford to spend much time in a lengthy perusal of the accomplishments of past years. I agree that the accomplishments of the last decade, the last year or the last month are of interest to the executive, but not of primary importance in the conduct of his business.

We in the light and power industry may be interested to know that not so many years ago electrical energy was sold for 15 cents, 20 cents or even 25 cents a kilowatt-hour, and that not so long ago it required 5, 6 or even 10 pounds of coal to generate a kilowatt-hour of electrical energy, but these facts are not of primary importance to a light and power executive. He is vastly more interested in knowing what it will cost him to serve his customers next year and the year after, and at what rates he can hope to meet competition, hold his present customers and attach new business.

A Pertinent Question

If you agree with me that the modern business executive is more interested in the determination of future costs than in the perusal of old records of performance, I would like to invite your attention to the consideration of a question, the answer to which I believe in a large measure rests in your hands and which, in my opinion, is of the greatest importance to light and power executives everywhere. This question is: How can the accountant better serve the light and power industry?

I have said that the answer to this question rests in your hands, which is another way of saying that I am not going to attempt to answer it here, but with your permission I will leave with you some suggestions which may assist in arriving at the answer. These suggestions have to do with the current problems confronting our industry, a better understanding of which is needed both within and without our industry.

An agency of the Federal Government is now conducting a searching investigation of the light and power business. This investigation was prompted by questions raised on the floor of the United States Senate by men who contended, among other things, that the light and power business has reached that stage in its development when it should be controlled or regulated by some agency of the Federal Government; and the Federal Trade Commission has been directed to make such investigation as may be necessary to determine whether or not Federal legislation to that end should be enacted.

Whether Federal regulation of the light and power industry would be good or bad for the public is a broad question of public policy, on which there is a wide difference of opinion; and I have my own decided views, as have most of you, on this subject.

The facts are that this industry is confronted with an examination; and before this examination is finished light and power companies everywhere will be required to answer many questions about their business.

So far as I know, there is no disposition on the part of the light and power companies anywhere to refuse to disclose pertinent facts about their business to bodies duly authorized to examine into the facts. But I am sure there is concern in many places that incomplete facts gathered here and there about certain phases of our business may lead to erroneous conclusions and may have a far-reaching effect on the minds of those men charged with determining whether or not there should be Federal legislation looking to the regulation of our business.

Therefore, in my opinion there is confronting the accountants of this industry the grave responsibility of seeing to it that in the course of this Federal investigation such facts as are required of us be presented in such a manner as not to lead to hasty or improper conclusions on the part of those who will be called upon to consider them, and who may be less familiar with our business than they should be.

It is well to bear in mind here that whatever may become of this present investigation, because of the quasi-public nature of our business, the light and power industry will always be subjected to some form of regulation by municipality or state. Fair regulation without intelligent information is impossible. I realize that through your Committee on Uniform Classification of Accounts much effective work has been done toward standardizing report forms for various state commissions, but the work of this Committee is far from complete. I believe you should consider the reorganization of the committee along broader lines to the end that the member companies of this Association may be able to get better advice from your Committee on this subject.

Accounting Aspects to Interconnection

The interconnection of large power systems throughout the country has now reached the point where it touches hundreds of communities and involves the purchase and sale of electrical energy between various companies. Each year will see more and more of these interconnection agreements in the interest of greater economies and better service to the public.

I believe this work would move forward much more rapidly if the accountants of this industry were more conversant with this problem. Here is a case where the engineer and the accountant should work very closely together and often failure to interconnect one system with another, or an isolated plant with a large power line, is due to improper allocation of costs. I would commend this question for your consideration, as one of very great importance.

Proper Accounting and Competition

There are still some people who hold to the opinion that the public utility business is non-competitive. This was never true of the light and power business, although I regret to say that some light and power men still seem to think so.

Approximately 61 per cent of the electrical energy sold in this country is sold for power purposes. Much of this energy is sold in direct competition with other forms of power, such as steam, Diesel engine, natural gas, etc. Many of the individual power customers of our electric companies are so large they are fully able to finance the cost of a private power plant when they are unable to get better service at lower costs from the light and power companies.

Only the great economies effected by the installation of large and highly efficient generating units have made it possible for our companies to hold some of their most valuable business and with the advent of improved Diesel engines, power companies everywhere are further threatened with the loss of business.

In many instances the determining factor in holding a power customer is the proper determination of his own over all costs of manufacturing power. The accountants of this industry could render a very valuable service, if they would give further attention to the matter of the proper determination of service costs for isolated plants. Some people may hold that this takes the light and power accountant outside of his own sphere, but I feel that any study of this kind that will throw additional light on this important subject is the public utility accountant's job.

Better Cost Records

America is known the world over for mass production and with this mass production in recent years has come lower unit production costs. No other industry has shown greater improvement in production efficiency than has the light and power industry. In fact, the point has been reached in some cases where the production cost of our product is negligible. Much of this improved efficiency has come about through new inventions and new and improved processes and equipment.

It is to be regretted, however, that little or no progress has been made in reducing the cost of distribution. We do not differ from other industries in this respect and, if we carefully analyze the family budget of the average American home, we will find that a large part of the cost of living is made up of distribution costs. All industry is directing its attention to a more careful scrutiny of this problem.

It is of vital importance that the light and power companies give this matter more serious consideration. In order that we may intelligently approach this problem, a more careful analysis of distribution costs is necessary. This problem is decidedly one for our light and power accountants to handle.

There are also large savings to be effected in what we term in this business "customer's expense." which for the most part falls under the direct supervision of the accounting executives of the various companies.

The Accountant and Proper Rate Structures

There was a time when the public utilities had a reputation for charging "all the traffic would bear." It may be that the industry earned that reputation, but few public utility executives are interested in this question today. They are more often interested in the question of how cheaply they can sell their service and still make a reasonable return. The most progressive light and power executive today realizes that our greatest ultimate success depends upon the widest economic use of our service.

In the intensive development of business, the light and power companies in many parts of the country are introducing promotional rates, rates for off-peak load, preferential rates for high load factor business, etc. All of these departures in the development of business require the most careful cost analysis. If our commercial departments are to be properly guided in attaching to our lines business that can be economically served, we must know more about the cost of various classes of service. This again is an accounting job and, while it needs engineering interpretation, you are the men who will have to marshal most of the facts with which to solve the problem.

The Accounting Problem of the Government in Business

In spite of the fact that this country has made the greatest progress of any nation in the world under the rule of private initiative in business, there are still many people to be found in this country who believe that we would have made even greater progress under government ownership. And, what is more to the point, many people throughout the country are openly advocating the political ownership of the light and power business.

Some able men who have studied this problem contend that back of this movement are the leaders of communistic thought, other people hold that many of our Socialists are responsible for this doctrine of the "government in business." But, I am satisfied that there are some people, who listening to these doctrines and being sincerely impressed by them, would immediately desert such doctrines if they had a better understanding of the economics involved in government ownership.

Many successful politicians are gifted orators, and often unhampered by facts, they are able to sway public opinion in favor of unsound doctrines. In the end, however, one who pleads at the bar of public opinion in this country must use facts and not fancies.

I am of the opinion that there is enough factual information available to prove to almost any open-minded American citizen that the Government should keep out of all lines of business, but I am equally certain that far too little real factual information about this subject has been presented to the American public. Too many of the people who oppose government ownership deal in glowing generalities and do not marshal the most effective arguments against it. As I see it, here is another problem which may properly commend itself to your attention.

I have offered here several suggestions for the consideration of the Accounting Section. Some of you may say that much of what I have said has more to do with economics, engineering and management than with accounting. But, to those I would answer with an expression which I shall borrow from that baby of industry in America, Aviation, which has adopted as its slogan "Lift up Your Eyes." for as I see it the accountant who wishes to best serve his industry must do that very thing in order that he may better view the problems which confront us to the end that he may aid in their solution.

CHAIRMAN FORD: Mr. Brock, Chairman of the Exhibit Committee, has asked me to call your attention to these little cards, a schedule of meetings or the times at which the various committees will be on duty, to furnish you with any information or answer your questions. They will be on duty at various times at the Accounting Section booth at the Convention Hall. You can secure these cards at the rear of the hall as you pass out after the meeting is over.

In trying to find out what to say about the speaker in introducing him, I endeavored to find out some things about our next speaker, not knowing at the time that I had already had the pleasure of meeting him. One of the things I found out about him, which must be good, is that he was born the same year I was. I don't know whether that is a handicap to him or not. However, many of you have had the pleasure of hearing our next speaker, you as his unseen audience. He has talked many times over the radio. His subject to day will be "The Trend of the Times." I know of no one more capable of talking to you on this subject than would be the President of the *United States Daily*. It is my privilege and pleasure to present to you Mr. David Lawrence. (Applause).

THE TREND OF THE TIMES

By David Lawrence

President, The United States Daily

I was wondering, as I came into the hall, what I could say to accountants, but there came instantly to me the refreshing thought of the many hours that I have spent in the last several years in studying phases of accounting that relate to the National Government, and I thought perhaps I might impart to you the wholesome respect that I have come to feel for those who are engaged in the accounting business in this country.

You naturally have a feeling of what I might call detachment toward government nowadays, and perhaps you are not as ready to see the good in some of the things that are happening. And perhaps, too, you feel that you are in the middle of a controversy and you are not willing to pass judgment upon the merits thereof. But when the income tax was first imposed it was viewed as a matter of great irritation, and I dare say since that time American business has come to understand that there is an affirmative value in a real system of taxation. And I doubt whether any single force, any single influence in educating the American business man has been as potent as proper accounting, which has been taught involuntarily through the income tax.

You are a group of men interested primarily in the financial side of the industry, and not in its public relations, and as the preceding speaker indicated, you are the ones from whom the facts will be sought when the time comes to pass judgment upon the merits of your policies. I have my own ideas as to the stage through which we are passing now, and perhaps I am an insufferable optimist, but I think that when all is said and done, and all the inquiries have been made, you will yourselves view what has happened as very largely constructive.

Education Requires Time

I go on the theory that it takes time to educate the people who are unfamiliar with the facts, but if the facts are legitimate it doesn't matter how long the time; they are their own reward. So I say to you that while your attitude at the moment may be one of hesitancy with respect to the operations of a Government that inquires minutely into your affairs, this is, nevertheless, a great cooperative influence which we may attribute to government, and the significance of which we cannot possibly escape in this modern age of ours.

We are passing through a stage, an economic stage, which is not easy to understand. We are given to temperamental attitudes, perhaps, because no one year is like the other. The American business man is so inclined to view his own affairs in the light of 90 days, especially if he is dealing with a bank, or in the light of a year, if he is dealing with an annual balance sheet, that he sometimes forgets we are a part of an epoch, part of a decade, part of an era, and that no one year is necessarily illustrative of the particular epoch. And you must take the whole in order to get a fair understanding of what is happening.

We need only to look back ten years to recognize how fleeting are our impressions of the future and how wrong might be our prophesies, and how easily they are unfulfilled.

Ten years ago we were talking in terms of prewar standards. The war had ended and the whole trend of thought was that we must return instantly to the base year, 1913. The economists were talking of everything in relation to 1913. We rarely hear about that now, because we have searched and we are groping for a norm which has no relationship to 1913. And, broadly speaking, we thought at that time that we had reached the peak in our industrial development. The great war machinery, the facilities for expansion, we regarded as merely the episode of the war. We thought it had no relation to our future. Perhaps mass production would have come anyhow. It was accelerated by the war. But we faced a large expansion of industry and we thought that the only way we could make ends meet was to deflate labor. We talked about Europe as if Europe was done for, and as if for generations to come, certainly within our lifetime, we would see chaos over there.

World Has Been Linked Up

We had the idea, too, that peoples would be distant; that this reconciliation might follow after 25 or 30 years, that it certainly was far off. We had no idea that the world would be linked up as quickly as it has since been linked up.

You know we had the opinion that the Allies wouldn't pay their debts, that the Germans would default, and we had one or two experiences which rather corroborated that tendency early in the decade. But ten years have passed and none of these things has happened. Instead of a Germany defaulting we have a Germany paying her debts, annually, punctually and in full. We have the Allies definitely on the dotted line, and many of them have already paid us. We are discussing at the moment a revision of the financial plan whereby reparations is being paid. We are discussing the refinancing of Germany, on the basis of an index of prosperity. And it is only fair to say that Europe has made an unprecedented recovery herself. The stabilization of her currencies, the rearrangement of the whole world of finance, has come about in these ten years. And as for ourselves we haven't deflated labor. We have increased the production of the labor dollar instead. We have gone forward to an expansion unheard of. In fact we have at times over-emphasized this expansion, so much so that we have been drawn occasionally into speculative excesses, as a result of that over-emphasis.

But to keep track of the thread that has gone through these last ten years in order that we might better understand the trend of the times that are coming, we must bear in mind that a war of the proportions which we witnessed brings its own unprecedented convolutions in the post-war period. And yet the United States, in these ten years that have passed, having solved the problem of production, and having made real progress toward distribution, now is confronted with the question of getting markets to absorb our immense surpluses.

Our whole politics is colored with economic conflict. We are concerned now in government with a proper balance between government and the economic growth of the country. You are constantly aware of the regulatory power of the Government; you see always the restrictive, the police power, the indirect coercion, you might call it, whereby Government enforces the statutes, or expresses its views on things that are not necessarily statutes.

But, as I see it, in an atmosphere of government from day to day the big thing of the hour is the cooperative side of government. It is the side which is seeking to give to industry its real impetus. It is the side which is searching for the facts. It is the side which is trying to coordinate industry and encourage greater progress.

The most significant movement of our times is the trade association movement. Say what you will, if you are the literary cynic who talks about the Babbitts, we know that the progress of this country is directly related to the trade organizations and the units that have been built up in business for the exchange of ideas. We know, too, that trade associations have become the greatest influence in the elimination of waste, in bringing about better understanding of industry among competitors within industry. We know, too, that government has played a part in bringing together discordant elements within industry.

Government Cooperation

The time will come, in my judgment, when the Government will be able to serve in a cooperative influence even in your industry, and when I utter the word "government," I mean it in its generic sense, because it is not merely the development of government in the federal idea, along cooperative lines, which is coming in America; it is the development of state government and state institutions too, which we are bound to find growing in that direction, because we are leaning on organizations, we are leaning on central institutions, in order that we may coordinate the interests of the public. That may sound vague to you and it probably is nebulous yet, but it is one of the distinct trends of the time, the necessity almost for cooperation between governmental bodies and industries.

I might say, parenthetically, that there will also grow up a definite and a real relationship which is not nebulous and which is not vague as to the proper responsibility of government and industry. There is in this a mutual obligation. In some infant industries in the early history of our Republic we found the Government extending direct aid. We find even today in such an industry as aviation, the Government extending direct aid.

With the last several years the Government has been a great factor in stimulating the growth of an American Merchant Marine. But there arose the desire, the natural desire, of the individual for the possession of that instrumentality which would assist him in realizing his destiny and today we have a policy established whereby the Government slowly relaxes its hold as a possessor, as a competitor of business and acts in a transition sense in order that the merchant marine may be established through private initiative and private ownership. That transition is an interesting one because involuntarily the Government was forced into the shipping business in the war, and yet public opinion has said that where the private industry can do a job effectively, efficiently, that is the function of the individual; that where the Government can cooperate to stimulate an industry to larger growth by contact with its trade associations, by assisting frequently in coordinating discordant elements in an industry, that can be the function of government.

And so, it is quite natural that in many industries where there is not even a suggestion of the regulatory power, this great cooperative influence proceeds and is making a very remarkable record.

The automobile industry is a good example of that. Government cooperation has assisted that industry materially. The gathering of facts from all parts of the world, the establishment really of a clearing house in Washington for the exchange of information relating to the export trade has made it possible for the motor industry to realize the great export market which it has available today and which indirectly is responsible for the continuance of the mass production machinery in the great motor centers, and which in turn has made possible the low-priced American car with the excellent design, within the reach of a great many more people.

It is that particular function of government, the extension of its aid in stimulating an industry and assisting it in reaching out for its markets, which is a proper function, and about which there can be no debate. It is on the question of the regulatory side of government that we have differences of opinion but there, too, as I said at the outset, I think you will find in the long run that the pressure of time will transform that influence into a cooperative influence.

Problems Largely Economic

The problems with which we are dealing in the central government are so largely economic, they are so largely the result of group action, sectional interest, commodity pressure, that sometimes I wonder how the person outside of Washington can get a fair impression of what is really happening in the center. You see these fragments of governmental action and sometimes you are led to judge of all government by these fragments. The most difficult job that we have today is to make the American people thoroughly conscious of what their Government is. So much happens because they are not only unconscious but they are indifferent. Time and again, men are appointed to public office who ought not to be appointed and the people who are affected thereby discover it months and years afterward. And it is not a solution for people to turn up their noses and say the whole thing is wrong, and, "I will have nothing to do with it," just because some of it is irritating and some of it is distasteful.

The attitude of mind of people outside of Washington toward Washington is the only thing that will purify the air and rid us of the inefficiency which we have and bring a true economic mind into government where it belongs, because government is no longer merely a political institution. There isn't a single question today which is strictly political with the possible exception of reapportionment, and even that might be drawn into an economic question, if you really took the time to find out its relationship.

If you are examining a tariff, you are touching an economic question. If it is the question of revision of the tax laws, it is the distribution of the tax burden—primarily an economic problem. If you are touching on railway consolidation, it is an economic question. If you are dealing with these surpluses that have grown up in agriculture, certainly there is nothing more complex than agricultural economics. Even the great subject of prohibition will have as the debate proceeds its economic aspect emphasized in relation to production and it will be decided in the last analysis to a large extent on whether it is beneficial to the large majority or whether it is merely an irritant for a small number.

So as you look over all the questions with which we are dealing in the Federal Government, or as you take the questions with which the States are dealing, you come face to face with that fact: that this is an era of economic emphasis and that government is feeling the pressure of the whole economic age in which we are living.

It means therefore all the more that people who are either in the legislative branch or in the executive branch should know their economics. I think it is partly because people are not interested in what we might call "dry reading" or partly because they don't understand how sensational some of this "dry" material is that we have only a relatively small group of persons interested today in government. That group must enlarge.

Finance Becomes Interesting

I remember when I first was engaged in writing and I had the newspaperman's attitude of aloofness from everything that concerned the industrial side, I had the feeling that all business was something apart, and so far as the Treasury Department was concerned in Washington, that was the department I was inclined least to visit, because it had to do with this complicated question of finance.

Then I went into business for myself and I found I spent all my time with the accountant, with the treasurer, and today it has become to me the most fascinating side of the businesses in which I am engaged, because I have come to realize that the accounting side really gives you a picture of the entire structure and guides you frequently when you are on the wrong track.

So, often things which seem uninteresting become interesting. Often, this question of information from the Government, this matter of the Government's relation to industry seems uninteresting, and we don't take the time to find out how truly sensational it is. Sometimes long after a fact is known we recognize its significance.

I am not a pessimist, and I am not discouraged because a relatively small number of people are vitally interested. I think the number is growing and rather rapidly, too. It will grow in proportion to the way in which this relation between government and business grows, and to the extent that people realize that the regulatory power can become license and that the cooperative influence can really mean progress. Those two separate parts of government, the regulatory power and the cooperative end of it will have to be thoroughly understood in order that government may function at its highest point. And in the period in which we are now living, the period that is coming, the Government's power to influence the situation will not diminish, in my judgment.

Regulation of Credit

No subject for example is more vital to us today than the regulation of credit. Since February we have observed carefully the influence of a governmental body on the credit situation acting, some think, with arbitrary power, others think constructively—certainly, the responsibility is imposed by law upon that body to act prudently and cautiously. And in the several months that have just passed we have witnessed perhaps a transition in this whole seven-year cycle which began in 1921. It may be that we have discovered the proper use of credit in America at this time. It may be that we have restrained the excesses. Time alone will tell. But certainly the responsibility was imposed by law upon a body to see to it that the credit of this great banking system of ours should not be used for wrong purpose. So I say to you, in conclusion, that the Government which just now happens to have its hand in an industry, in a sense, perhaps, regarded by you as an unwarranted intrusion, may in the end prove to you that the exposure of facts is the most enlightening self-help you could have administered.

Thank you. (Applause).

MR. C. M. BREITINGER (The Philadelphia Electric Co., Philadelphia, Pa.): Mr. Chairman, I move a vote of thanks and appreciation of the National Accounting Section be extended the speakers who have given their time and effort to address us this afternoon.

[The motion was seconded.]

CHAIRMAN FORD: It has been moved and seconded that a vote of thanks be extended to the speakers who have given of their time to address us this afternoon. I am going to ask those who will give their consent to kindly rise.

[Carried by a unanimous rising vote.]

CHAIRMAN FORD: The next order of business on our program is the report of the Nominating Committee. I will now call on the Chairman, Mr. W. B. S. Winans.

Nominations

MR. W. B. S. WINANS: The Nominating Committee has had several sessions endeavoring to determine the list of names to be presented. It has waited from time to time for political approaches and felt that here was an opportunity for remuneration for the Accounting Section, but has had no overtures of any kind. Its report, therefore, is rendered to you, as I believe all past reports have been, solely from the viewpoint of availability and desirability. The list is as follows:

W. R. Emerson, Oklahoma Gas & Electric Co., Oklahoma City, Okla.
Franklyn Heydecke, Public Service Electric & Gas Co., Newark, N. J.
J. H. Lobban, The Detroit Edison Co., Detroit, Mich.
J. E. Loiseau, Public Service Co. of Colorado. Denver, Colo.
B. F. Brahaney, H. M. Byllesby & Co., Chicago, Ill.
Oliver E. McCormick, Middle West Utilities Co., Chicago, Ill.
H. C. Hasbrouck, Associated Gas & Electric Co., New York.
E. S. Brock, Public Service Electric & Gas Co., Newark, N. J.
G. U. Stewart, The Philadelphia Electric Co., Philadelphia, Pa.
J. A. Rockwood, Portland Electric Power Co., Portland, Ore.
B. F. McGuire, Commonwealth Edison Co., Chicago, Ill.
C. E. McBride, Electric Bond & Share Co., New York.
Frank C. Gordon, New York & Queens Electric Light & Power Co., Long Island City, N. Y.
Thomas M. Ford, Philadelphia Electric Co., Philadelphia, Pa.
R. O. Launey, Brooklyn Edison Co., Brooklyn, N. Y.

CHAIRMAN FORD: You have heard the report of your Nominating Committee, what is your pleasure?

MR. DOUGLAS BROWN (New York & Queens Electric Light & Power Co., New York): I move, Mr. Chairman, that the report be accepted and the nominations closed.

[The motion was seconded, was put to a vote and carried.]

CHAIRMAN FORD: I hardly need to inform you that the next order of business is adjournment. All those in favor?

[Upon motion regularly made and seconded, it was voted to adjourn, at 5.10 p.m.]

COMMERCIAL NATIONAL SECTION SESSION

COMMERCIAL NATIONAL SECTION SESSION

WEDNESDAY, JUNE 5, 1929

[The meeting convened at 3 p.m., Mr. Marshall E. Sampsell, Chairman of the Section, presiding.]

CHAIRMAN SAMPSELL: The meeting will please come to order.

As provided by our Constitution, our Executive Committee has named as the Nominating Committee the following gentlemen: Mr. E. W. Lloyd, Chairman; Mr. George E. Miller, Mr. M. E. Skinner, Mr. M. C. Huse and Mr. D. Smith. We will have the report of this Committee at the conclusion of our meeting.

At this morning's session the report for the Commercial Section was read, and, therefore, your Chairman in his desire to give each of the Vice-Chairmen full opportunity (at least as full as we can under the circumstances) to present the activities under the Committees in his bureau, will say nothing except to emphasize again the appreciation every one of us in this section has for the work of the other.

We will now hear the report of the Lighting Bureau by Mr. T. O. Kennedy, Vice-Chairman, Ohio Public Service Co., Cleveland, Ohio.

REPORT OF LIGHTING BUREAU

BY T. O. KENNEDY, *Vice-Chairman*

(For Bureau Personnel, See Appendix 4)

Fifteen minutes is just the right amount of time for the report which I am going to make of the Lighting Bureau, because the Lighting Bureau this year has been fortunate in having that kind of personnel constituting its Committees of which it can be truthfully said, "By their works ye shall know them." If, by any chance, there are any in the audience who are not fully conversant with the activities of the Lighting Bureau during the past administrative year, then I will say that the time at my disposal is entirely inadequate for proper halo polishing on my part. Therefore, I shall not attempt it.

I am going to talk now about some of the things that the Lighting Bureau cannot claim credit for as much as it would like to so claim credit. I refer to the permanent lighting exhibition maintained by the lamp manufacturing companies at Cleveland, Harrison, Chicago, and the new and elaborate exhibit at the Grand Central Palace in New York. I refer to the Lighting Festival here at Atlantic City, which is ushering in the celebration of Light's Golden Jubilee, marking the fiftieth anniversary of the development to perfection of the incandescent lamp, by Thomas A. Edison.

Industry Has a Job to Do

The Lighting Bureau believes that the electric light and power industry is away behind in its work when it comes to awakening the public consciousness to the benefits of proper illumination. The Lighting Bureau has hoped and has tried to inspire the member companies of the N. E. L. A. to do in a few years what it has failed to do in the past fifty.

A study of the development of the electric light and power industry in the United States shows a remarkable growth of the use of central station power in manufacturing establishments. Not only have other forms of power been very largely replaced, but new and additional uses of electricity for power and heating purposes have been devised and adopted.

Electric lighting has almost entirely supplanted other forms of illumination in cities, towns and hamlets, and even in rural districts.

To make electric service so universally available, the electric utility companies have invested fourteen billions of dollars in generation, transmission and distribution facilities and, in so doing, have made a material contribution to the prosperity of the nation and to the improvement of living conditions.

The industry has a greater obligation, however, than merely making electric service available. It must promote, encourage and make possible the use of that service by each customer to the maximum extent that the customer can use it for his benefit.

It follows, therefore, that in addition to the highest type of managerial and engineering ability for construction and operation, the industry must have outstanding commercial talent with vision and aggressiveness.

We will have to confess that we have done a poor job of selling our service during the forty-seven years that our industry has been in existence. We can take small credit for the extensive use of electric power in manufacturing. The power users themselves, quick to take advantage of every possible opportunity to increase efficiency, have applied electricity in their production processes. We did not sell our service to them—they bought it.

These industrial users, however, constitute only about 5 per cent of our total customers. The other 95 per cent, more than twenty-two million customers, are yet making but meager use of our service. Here is our opportunity and no less our obligation.

Without question, the most valuable service we have to offer these customers and the service they most lack and need is proper illumination.

The Lighting Bureau has attempted to awaken the interest of the N. E. L. A. member companies in the development of additional lighting business, and has tried to formulate specific plans that could be put into effect by member companies desiring to accomplish this purpose.

Home Lighting Committee

The Home Lighting Committee under its Chairman, Mr. W. T. Blackwell, has done excellent work. One serial report was prepared outlining the organization and duties of a home lighting service department, and it also contains suggestions covering the selection of the personnel of a home lighting service department.

The second serial report of this Committee embodies a critical analysis of various refixturing campaigns carried on by utilities throughout the country, and recommends a suggested form of refixturing activity for the guidance of member companies contemplating such work.

The Committee also arranged for the preparation of literature for distribution to prospects by home lighting specialists connected with member companies. To meet this need a special edition of "Beauty at Home" was prepared by the Bowser Service Corp. This literature is available to any company desiring to use it.

Commercial and Industrial Lighting Committee

The Commercial and Industrial Lighting Committee, under the chairmanship of Mr. J. Daniels, has done most effective work in promoting better contact between architects and lighting service men of the member companies. Two schools have been held, one at Harrison, N. J., and the other at Cleveland, Ohio, in order to acquaint lighting men with the information and methods that they should use in contacting architects. Both of these schools were very well attended.

A list of central station lighting men has been made up and furnished to the American Institute of Architects in order that they may advise their men where authoritative information on lighting and wiring could be obtained.

The Committee also prepared wiring specifications or recommendations that enable an architect to insure the installation of adequate wiring in new buildings. These recommendations, when embodied in the wiring specifications prepared by the architect, will provide for future increases in the standards of illumination.

The American Institute of Architects has accepted the Committee's efforts in this connection most cordially, many of the institute members being in attendance at the two schools above mentioned. Mr. L. E. Kern, Secretary of the American Institute of Architects, has cooperated with our Committee in promoting this work.

The Committee has assisted The Society for Electrical Development in preparing three sets of broadsides covering commercial, industrial and new building lighting. These very effective mailing pieces are available for the use of member companies in opening the prospect's door for their lighting salesmen.

Street and Highway Lighting Committee

The Street and Highway Lighting Committee, under the chairmanship of Mr. R. J. Malcomson, reports that during the year there was a marked tendency toward the use of higher intensity street lights, many cities making complete changes in their street lighting systems to eliminate small candle power lamps. The street lighting of a town reflects the character of commercial lighting and, to a certain extent, residential lighting. Good street lighting is usually accompanied by good window and store lighting, while, as a rule, poor street lighting is accompanied by poor commercial lighting.

The Committee has endeavored to call this fact to the attention of member company executives, so that they would recognize that the development of the street lighting load not only is a service to the public but is a definite step toward building up their entire lighting business. It has been the attempt of the Committee to impress upon member companies that street lighting development is a commercial responsibility and as such should receive the same active and aggressive attention of the commercial manager as do other forms of load development.

The Committee has endeavored to show the economic fallacy of the use of lamps of low intensity. In conjunction with the Illuminating Engineering Society committee on street lighting, definite progress has been made on eliminating lamps of an intensity of less than 250 candle power.

A survey is now under way showing the type of lighting in various cities in this country so that a basis for street lighting measurement can be formulated. It is expected that this survey will be completed before the end of the summer, and recommendations will then be given as to the definition of adequate street lighting and a measure by which every member company can compare its street lighting load.

The Committee is cooperating with the Rural Service Committee in developing highway lighting as an aid to non-congestion of highways at night and as a means of providing rural lines for farm customers.

Work of the Electrical Advertising Committee

The Electrical Advertising Committee, under the chairmanship of Mr. C. J. Eaton, has been most aggressive throughout the year. Considerable work has been done on the formulation of a model sign ordinance, which will be complete at an early date. The need of such an ordinance, which will be fair to the general public and to the lighting industry, is generally recognized.

The Committee has in preparation a number of articles dealing with the subject of sign maintenance, and these articles will be published in the near future in various trade papers and also in the N. E. L. A. *Bulletin*.

Electrical advertising schools have been sponsored by the Committee. These schools were conducted by the Great Lakes, New England and East Central Division with most successful results.

The Metropolitan Section of New York has made definite plans for a school, and at least three other divisions have made tentative plans for similar activities.

As a result of the Committee's activities, the Geographic Divisions are paying particular attention to the subject of electrical advertising, and the Committee Chairman recommends that everything possible be done to maintain this interest through the prompt reappointment of Geographic Division Committee Chairmen.

The Committee has cooperated with the publication, "Signs of the Times," in conduct of a national contest for electrical advertising. As a result of the Committee's activity, the Federal Electric Co. award is being competed for by member companies, the winner for 1928 being announced at today's session.

"The Symposium of Electrical Advertising," in the form of a serial report, has been distributed to member companies. This report covers the three sections: Commercial, technical and accessories, and is very valuable as a ready reference or text book.

The Society for Electrical Development, in cooperation with the Committee, is formulating a plan book dealing with the mechanics of the sign business.

Your special attention is directed to the exhibit of the Electrical Advertising Committee at this convention.

Geographic Division Groups Cooperate

A report for the Lighting Bureau would be decidedly incomplete if specific mention were not made of the valuable cooperation which the Bureau has had from the Geographic Division organizations. The Committee wishes to point out that in its mind the greatest result in the development of public consciousness for better illumination can be better promoted through the activities of the Geographic Sections than through any other means.

Every talking movie should have a theme song. I am not going to sing, but I would like to suggest a theme story dedicated to every member company of the N. E. L. A. that is not making now a sincere effort to develop additional lighting business. Two negro boys were taking a short-cut through a cemetery. This was in the daytime, and in walking along and reading the epitaphs, one of them read from a gravestone, "Not dead, but sleeping." He read it out loud to the other one, who said, "That fellow ain't foolin' nobody but hisself."

Thank you! (Applause).

CHAIRMAN SAMPSELL: The next will be the report of the Power Bureau by the Vice-Chairman and Chairman of that Bureau, Mr. V. M. F. Tallman of Charles H. Tenney & Co., Boston, Mass.

REPORT OF THE POWER BUREAU

BY V. M. F. TALLMAN, *Chairman*

(For Bureau Personnel, See Appendix 4)

Commercial action is called for, not only by every executive who has been upon this platform, but also called for here in this convention hall in symbolic form.

Some time ago several enterprising men of this city conceived the idea of building an auditorium. We have the privilege of being the first to use it. Those men had a commercial idea. If you don't believe that they built for commercial action, look at the symbols on every one of these curtains, and over my head—"C.A."

Now, gentlemen, if you get no other thought from this little talk of mine before this Convention, I ask you to take home with you what that means—*C.A.* It means *Commercial Action*. It means that every man in this business must get that thought into his head and see that it is carried out. It is a constant reminder of our obligations.

We have been told that two-thirds of the energy which we manufacture is sold for power and heating purposes. That is sold, as you know, at relatively low rates.

It seems to me, therefore, that it is all the more important that we not only get additional power and heating business, but also that we endeavor to maintain and keep all of the present business which we have. That, in my opinion, is a harder job than getting new business.

The competition which we have in the power and heating business today is tremendous. It is on every hand. Every time our salesmen go out they meet competition. It may be competition in power, it may be competition with some form of heat, but it is there.

Therefore, *commercial action* is necessary and mandatory.

My purpose is three-fold: first, to show you briefly what has been accomplished by the committees which are in the so-called Power Bureau. Those committees are the General Power Committee, the Commercial Cooking and Heating Committee, and the Industrial Heating Committee, all of whom have actively carried out, in my opinion, and in the opinion of the officers of our Association, an outstanding job.

Second, I want to point out some of the problems which we young men see ahead of us in developing this commercial and industrial power and heating work.

Third, I would like to make some specific recommendations which I hope will at least arouse the executive interest and the interest of the commercial men in carrying out the job ahead of us.

An account of our stewardship would not be complete if I did not tell you that it had been devoted largely to the training of men, to the training not only of central station men, but to supplying information to those men in the many factories and industries to whom we sell our service. This training has been carried on in several ways by the different committees which I have had the pleasure of sponsoring. The committees have also prepared and published many reports which we could not, in the brief time given to us, tell you about. I wish to call them to the attention of the commercial men, the power men, and the heating men, if they have not already seen them. Get them, study them, read them, present them to your executives with your recommendations as to how they should be put into effect in your companies.

Commercial Cooking Committee

The Commercial Cooking Committee is preparing a paper on Marketing Electricity for Commercial Baking, which is one of a series of reports on Marketing Electricity being prepared under the supervision of headquarters.

General Power Committee

The General Power Committee has prepared several papers dealing with the competitive situation of power, and the Industrial Heating Committee has prepared some excellent articles on the application of electric heat to industry.

During the year two schools have been held to train the central station men. One of these schools was held last fall in Chicago; it was held by the Commercial Cooking Committee. Sixty men were trained in the art of applying electricity to cooking and baking problems on a major scale.

Perhaps someone will say, "Well, what is the opportunity in this commercial cooking business anyhow; what does it give us, the central stations? It is a fine thing, but what do we get out of it?" I have two examples here of the value of the baking load, which I would like to present to you for what they are worth. In a city of 100,000 population, there is a cooking and baking load of 8000 kw. That returns a revenue equal to the revenue returned by the lighting load of a neighboring city with 25,000 population. Gentlemen, I ask you if any load which will return, in a city of 100,000, a revenue equal to the total lighting revenue of another nearby city of 25,000, isn't worth going after? Two-thirds of that load is off peak, which makes it all the more attractive. I am told that much of it was taken on without any substantial increase in the investment. That ought to appeal to the officers of the company and to the stockholders.

In another city of 100,000 population, there is one hotel at which I have been many times, where the cooking and baking load is equal to 500,000 kw-hr. a year. The lighting and power kilowatt hours are also equal to 500,000 kw-hr. a year. In other words, this cooking and baking load is equal to the sum of the lighting and the power load.

Now we believe this, that whichever fuel is best adapted to do this heating and cooking work, that it is the fuel which our men should recommend. If they don't recommend the best fuel from the customer's standpoint, but put in an application which isn't proper, that application will not be permanent and we will be the ultimate losers.

Industrial Heating Committee

The Industrial Heating Committee has also carried on schools. During the past eight years, under the direct auspices of the Industrial Heating Committee itself, we have carried on schools at the works of the General Electric and Westinghouse Companies to whom we owe our sincere thanks. These manufacturers have spent thousands of dollars to educate our men. This year we thought the scope of the school might be broadened if it were held at some centrally-located technical school. By this means we could select the speakers from the best men in the manufacturers of electrical equipment and the central stations, to talk to our men as to what electrical heating would do. We had an attendance of eighty men at that school from all over the United States, Canada, Mexico and even South America. This advanced school was held, as you may know, at the Case School of Applied Science, last May.

We recommend that that method be carried out in the future.

During the year we have also tried to carry the message to the users of electric heat. We had many conferences. Three conferences have been held at universities, Penn State College, the University of Michigan and Massachusetts Institute of Technology in Boston. These conferences gave the prospective users of industrial heating the opportunity of listening to worthwhile papers presented by the heating men in our industry.

As an example of what has been done, at the conference in Boston the latter part of February and the first part of March, we had an attendance, gentlemen, of 1200 men coming from the industries of New England. These men were the ones who actually used the service. We believe that is a good way to get our message to the ultimate user.

Valuable Promotional Effort

We have carried on another feature in our work. We have a film called "Electric Heat in Industry," which was written, filmed, and presented by this Committee. At the National Metal Exposition in Philadelphia last October, your Committee presented this film to over 3000 people. Those people were the executives, the plant engineers, the metallurgists, and the purchasing agents coming from industrial plants all over the United States. They were looking for new developments in equipment for use in the industrial arts. Your men showed them the applications of electricity for those purposes. We believe that the educational and sales promotional value of our exhibit and contact with these men cannot be fully estimated.

Plans are now under way for another exposition at Cleveland next fall, where several new features will be presented.

In January, 1929, in California, at the Western States Metal Exposition, some work was carried on in industrial electric heating through the Pacific Coast Electrical Association under the auspices of the National Industrial Heating Committee. At that exposition the film was shown. There was a total attendance at the exposition of over 52,000 people. So we think that is a good way of telling our story.

We have held geographic schools. We have carried on publicity in the trade papers and a further program of publicity is now being prepared. This has already been given indorsement by the Executive Committee of the Commercial National Section, and we hope that the publicity program will be carried out in the future.

Some Sales Problems

Second, I would like to make some general observations as to what we are up against in the sale of power and heat. As you well know, the development of the internal combustion engine has presented a problem to our power sales engineers which makes it mandatory for us to do several things. In my opinion, every central station must give heed to its power rates. Some of those rates have not been redesigned for many years. They are obsolete in form; they don't recognize load factor. There are many things about them which must be changed. Some of them are almost flat straight line rates. They may be too low for the small business; they may be too high for the big business. There may be a point in the middle of those rates where they are too high to get certain medium-sized business.

Gentlemen, I recommend sincerely that you look over your power rates and take into consideration competition where there are other forms of power-producing apparatus; take into consideration the load factor of business which is obtainable. Don't forget to take into consideration the proper cost analysis to make sure that your power rates bring to you a reasonable return on the investment devoted to that class of business. If you do this, it seems to us you will put into your power salesman's hands one working tool which is absolutely necessary.

We also believe in this competition we must have more contact with our power and heating customers. We believe, with the competition ahead of us, closer contacts, more direct contacts must be made. Our commercial men must know the problems of our customers just as well as those customers know their problems themselves. Our power men have to be highly trained technically; they have to be good economists in our business; they must in our opinion be good economists in the business of their customers if they are to succeed in putting over our sales programs.

We believe our men must be trained. We have called upon the manufacturers to train those men in the past. We have called upon the manufacturers to supply us with all sorts of technical information. Gentlemen, how long we can continue to call upon the manufacturers we do not know. They have been more than kind, they have been liberal and generous in what they have done.

Selecting and Training Personnel

Third, I would like to recommend to the executives, commercial action of this kind: First, that the executives see to it that you have an adequate commercial personnel as regards power, cooking and heating. Go to the colleges this year. Talk to the graduates of the colleges. Tell them your story. Other industries are out ofter those graduates. They are taking the pick. I wonder if we are going after our future executives now as we should.

Take those men you pick now and give them every opportunity to train themselves. Teach them. Give them rates to go out and sell the service. Tell them, more important, what your policy is in every respect so that they know what they can do for the customer. Encourage them to come back to the office with the customer's viewpoint and ask to have things done for the customer. My prediction is if you will do that you will build up a staff of men that will carry on our business as it should be carried on. The competition for the investor's dollar today is such that unless you do it your company will fall by the wayside.

Study, Study, Study!

To the commercial men I would like to make these recommendations: Train yourself. Study, study, study! There is no end to it, gentlemen. You must know your customer's business; you must know the routing in his factory; you must know his production costs; you must know all about his business as well as all about your own. May I recommend that you commercial men, power sales engineers, heating and cooking engineers, and industrial and electrical heating engineers, invest in your company. I sincerely believe that a company worth working for is worth investing your money in. Go out and borrow the money if you haven't got it, but invest in it, and you will get a new slant on your job. Then when you go out to sell the customer, assuming you have invested your own money in your company, you will make that dollar you have invested work overtime night and day. Make the load factor of that invested dollar return double what it is doing. Gentlemen, it can be done.

I would like to also ask the commercial men to no longer be "yes" men. Too many perhaps have been known to say and do only those things which were easy to do. I do not believe your executives want a commercial man who is a "yes" man. I believe they are paying us to bring to them ideas to develop our business. I believe they want us to come to them with well-thought-out programs, so they can say "Go ahead." I think they would much rather do that than turn you down.

Commercial men, please have a well rounded-out program when you go to your executive. Otherwise, you'll have nothing to say about the executive not backing you up unless you can present to him full rounded-out plans, programs and recommendations.

Finally, commercial men, know your job! Know it from the central station viewpoint; know it from the viewpoint of your stockholders; know it from the competitor's viewpoint. Know how to meet that competition and, finally, but most important, know it from your customer's standpoint.

Gentlemen, the architects of this building designed it for us better than they knew, for not only did they give us these symbols "C.A." around here as a constant reminder of our obligations to carry on a *Commercial Activity,* but they also gave us another symbol which I believe we would do well to contemplate. That symbol is up in the center front: "Libra"—the scales or balance.

When we give an account of our stewardship of the commercial business of our companies, let us not be weighed and found wanting.

I thank you!

(Applause).

CHAIRMAN SAMPSELL: Mr. F. D. Pembleton, Chairman of the Merchandising Bureau, will now make his report. Mr. Pembleton of the Public Service Company, of Newark, N. J.

REPORT OF MERCHANDISING BUREAU

By F. D. PEMBLETON, *Chairman*

(For Bureau Personnel, See Appendix 4)

Your Merchandising Bureau undertook its work with the strong purpose of accomplishing definite results which could be adopted by and reflected in the field work of the various companies. The degree to which the purpose has been fulfilled is shown by the respective reports of the Committees comprising the Bureau.

Mr. C. L. Dunn and his Committee on Refrigeration have prepared a most comprehensive plan of educational publicity which it is believed will develop a very large volume of refrigeration business. This plan has already been put into operation.

Mr. Norman T. Wilcox and his Committee on Electric Water Heating have compiled a great deal of valuable data on various problems which will be very helpful to companies planning the development of electric water heating business.

This information will soon be given to the industry in the form of serial reports.

Mr. Wilcox and his Committee have not been able to complete the compilation of all of the data necessary to a comprehensive report on water heating and it is hoped that the incoming administration will decide to continue Mr. Wilcox's Committee in order that its valuable work may be completed without interruption.

The Domestic Electric Range Committee, under the very able direction of Mr. Frank A. Coupal, set itself the task of clarifying much of the discussion that has taken place in regard to electric ranges and to compile definite data which could be given practicable application in the development of range business.

This data, as outlined in the report of the Range Committee, given herewith, has been compiled in a very thorough, painstaking manner. It is now available to the industry in the report entitled "Marketing Electricity for Domestic Electric Cookery." This report presents, under one cover, much, if not all, of the information that a salesman will need in the development of electric range business.

The report is a very accurate reflection of the enthusiasm and energy that has actuated your Range Committee.

Your Merchandise Sales Committee, under the Direction of Mr. C. L. Harold, approached its work with a very clear and comprehensive understanding that it was confronted with a number of problems that offered both opportunities and responsibilities.

The Committee undertook to handle these problems in a manner that would develop the greatest results and at the same time promote harmony throughout the industry.

Through the work of the Farm Equipment Subcommittee, an effort has been made to develop a plan of organization and work that would promote a very much broader use of electric service and appliances on the farm.

The details of this work, with which the Merchandise Committee was affiliated, are presented very thoroughly in the report of the Electric Farm Equipment Subcommittee.

In an equally comprehensive manner, your Merchandise Committee has endeavored to develop a basis for better trade relations, for maintaining quality standards and to develop a larger sale of current for residence uses, all of which are outlined in the accompanying report of the Merchandise Sales Committee.

The maximum sale of current for residence purposes will be made only when, in addition to a generous use of light, there is also, in most homes, a very general use of a larger variety of electric appliances.

Must Create Public Appreciation

What the electrical industry needs, insofar as residence business is concerned, is the creating of a great public appreciation of and greater indulgence in the comforts which complete electric service provides.

The magic of electricity must be made spectacular in order that it may catch and hold public interest, as radio and aviation have held the interest of all people.

The electrical home must be made a fad among housekeepers and home builders.

Electrical methods must be set up as a style of housekeeping and a craze for it created just as the demand for color in kitchen and bathroom was created; and as demand for electric refrigeration is now being created.

The speed with which the style of electrical housekeeping will be established will depend upon the degree of sales promotion given to the appliances that perform the house work that is hard to do. Other appliances will follow the trend of the style.

The appliance with the largest over-the-counter demand, the electric iron, eliminated hard, hot, tiresome effort; the second largest selling appliance, the vacuum cleaner, and the third largest selling appliance, the washing machine, eliminated the hardest, most disagreeable and unhealthiest of all household duties. That is why they are the largest sellers.

A recent survey developed the information that 55 per cent of the owners of electric refrigeration purchased them to eliminate the inconvenience and labor of using ice. Less than 10 per cent purchased for reasons of health.

To catch and hold the public interest, to overcome the fixed ideas and habits of housekeepers, and to set up a style or craze for electrical methods of housekeeping, requires the use of every known promotional method used with such intensity and skill as to sway a whole nation and accomplish in months a degree of progress that would otherwise take years. Such are the methods that are building the electric refrigeration business. They should be applied to the sale of all electrical appliances, regardless of type or current consumption.

The present national volume of electrical retail sales, including appliances and accessories, has been estimated to be a little over $750,000,000.

It is neither exaggerated nor unfair to say that volume of sales has been accomplished with efforts that were, in many localities, very inadequate.

So it seems rational to state that, with a great combined industry, effort that is national in scope, thoroughly balanced in organization, sincerely cooperative in spirit, operated with intensity and skill, the present electrical retail sales can be doubled in less than five years.

It also seems obvious and logical that the whole central station industry, including the executives, should immediately take a more earnest attitude toward the electrical appliance business and aggressively promote it in a comprehensive manner that eliminates indifference and mediocrity.

Service Also Interpreted Through Appliances

With a more whole-hearted interest in electrical merchandising on the part of the executives of central station companies, their respective merchandising departments can be made to win admiration for their company's efficient methods and to develop a very great degree of good will and predisposition favorable to the company, because it is through the medium of appliances, almost as much as through the medium of lighting equipment, that the company's service is interpreted to its customers.

A well organized and properly managed merchandising department is a logical and legitimate part of the central station's organization, because the department completes the central station's whole service to its customers.

Because it is a part of the company's service and because it has such a direct and powerful influence in presenting the company to the public, the merchandising department of a central station should be just as carefully and completely equipped as its generating station. Both form a part of the basis of the company's complete service to its customers. As such, both are equally important.

A central station company's merchandising methods should be based upon the economical and psychological principles that have been developed through years of study and research, and which have a basis just as scientific and irrevocable as the principles underlying the central station's engineering practices. Results in merchandising can now be predetermined with a remarkable degree of accuracy.

Retail Stores Set the Standard

There are hundreds of stores in Philadelphia all using practically the same merchandising methods, yet none have perfected those methods equal to Wanamaker. In San Francisco there are many stores selling oriental goods; but nowhere in that city nor anywhere in this country is there an oriental store equal to Gumps. In almost every large city there is some one firm which has developed its merchandise practices to a degree far superior to that of most of the stores in the city. These leaders illustrate the art and science to which merchandising has been developed. They set the standards by which central station merchandising will be measured by the public.

If there should be too great a difference between the practices of the leading merchandisers and the central station merchandise departments, the comparison is likely to reflect unfavorably upon the entire central station organization.

There is no real reason why there should be any great difference.

The merchandising methods that should be used are obvious to anyone who really wishes to know.

There is sufficient money and executive ability in the central station industry for it to bring its merchandise departments to the highest standards that have so far been established.

All central station executives should, with enthusiasm and pride, spend the money necessary to equip their salesrooms with the most modern store fixtures in a manner that compares very favorably with the stores of the leading merchants. Many central stations have done that.

If the central station sells appliances at all, then the public will expect to be able to secure from the central station any type of appliance that has been widely advertised and established to a reasonable degree.

The public will expect the central station to know about all appliances and to display a wider assortment of appliances than perhaps any other dealer; and the central station serves its own interest by doing so.

The slogan, "He profits most who serves best," applies to the central station that provides its customers with the opportunity to buy any type of appliance for which there is a reasonable demand, regardless of its current consumption.

Sell All Types of Appliances

The complete electrical equipment of homes will be attained quicker, and there will be a larger demand for each type of appliance, if an aggressive effort is made to sell all types of appliances, because then the electrical method will be earnestly promoted at every opportunity.

If a central station merchandises on any other basis, it defeats the real purpose for which its merchandise department was established; it brings about an unbalanced marketing condition; and thousands of dollars spent by manufacturers for advertising will not be given the full local support that it would otherwise receive.

So the central station should carry the most complete line of electrical appliances in the city and aggressively sell each type.

Through its merchandise sales force, a central station makes a very large part of its customer contacts.

Central station salespeople should be so thoroughly educated regarding electric appliances, and so well trained in the art of selling them, that the central station sales people will be far more expert in the sale of electric appliances and render a much more satisfactory sales service than the sales people of other merchandisers. The public expects such ability and sales service from central station's sales people.

A central station's advertising on appliances should be the product of professional experts and never that of one untrained in advertising.

When central station executives will take cognizance of all these factors and put their respective merchandising departments on a high grade basis comparable with the best merchandising firms, and render their customers a more complete service, there will be no real reason for criticism of central station merchandising practices. Then the time will be advanced when every home will enjoy a more nearly complete electric service, and insofar as the merchandise department is concerned, the central station will enjoy the respect and good will of the entire community.

Reports of Chairmen of Committees of the Merchandising Bureau follow:

REPORT OF REFRIGERATION COMMITTEE

By C. L. DUNN, *Chairman*

(For Committee Personnel, See Appendix 4)

Your Refrigeration Committee during the fiscal year which closes with the Convention at Atlantic City, in June, took for its work a closer coordination of efforts in the refrigeration industry. We found that each manufacturer of refrigeration equipment was carrying on his sales and promotion work without any regard as to the work being accomplished by his competitor.

We believed that it was possible to bring the industry closer together and work out a cooperative national educational program that would tend to sell the American public on the possibilities of electric refrigeration from the standpoint of health and food preservation.

National Food Preservation Plan

After several meetings of the Committee, a plan was formulated for the purpose of carrying on this national food preservation movement, which incorporated every manufacturer, jobber and dealer interested in refrigeration. This plan also called for the indorsement of every national and local group interested in health and food preservation, such as National Dairy Association, Federation of Women's Clubs, Medical Association and others.

This plan was approved by the Executive Committee of the Commercial Section and by the N. E. L. A., with the understanding that the N. E. L. A. Headquarters would not only approve it, but actively sponsor and direct it from headquarters through the office of Mr. C. E. Greenwood, the Commercial Director.

The plan stated that all finances connected with the national committee which would direct the activity be raised through subscription by the manufacturers of electric refrigeration and ice boxes, and that all local promotional expense be borne by the local utility and all interested groups. At this writing approximately $200,000 has been subscribed to carry on this educational program, and the Millis Advertising Agency of Indianapolis has been employed to assist in directing the movement.

Two Main Achievements

We feel the Committee accomplished two outstanding achievements:

1. By getting a cooperative spirit existing among the refrigeration manufacturers.
2. By securing their help in promoting this national educational program which will not only make our customers conscious of the fact that there is a food temperature for proper maintenance of food, but there is a heat temperature for comfort.

It is an outstanding opportunity for the N. E. L. A., as it should do more toward promoting better trade relations than any movement recently undertaken.

This entirely finished plan of operation has been turned over to the N. E. L. A. for execution as representing the Committee's work for the year.

REPORT OF ELECTRIC WATER HEATING COMMITTEE

NORMAN T. WILCOX, *Chairman*

(For Committee Personnel, See Appendix 4)

This Committee was organized with an active personnel, consisting entirely of central station men from various parts of the country, as evidenced by the list of members.

The representatives of some of the leading manufacturers have sat in with us at most of the meetings, and have been of great assistance in discussions and in obtaining necessary information for a report.

The first two full sessions were held in New York City in October. Another meeting was held in Detroit Feb. 5, which was well attended by representatives from all parts of the country, there being two from the Pacific Coast.

Useful Information Obtained

The statements by members from various sections of the country resulted in bringing out much useful information concerning conditions of operation and local limitations peculiar to the particular parts of the country in which the service is rendered.

This meeting was particularly satisfactory in that it gave the various members of the Committee a comprehensive idea of the breadth of the problem and the variant conditions under which water heating service must be rendered.

This discussion also emphasized the fact that customers of apparently the same capacity were using very different amounts of energy for hot water service. It is apparent that a satisfying hot water service must precede a full development of domestic water heating.

A third meeting, held in Chicago in March with the group meetings of the Commercial Section, was not quite so representative as the Detroit meeting, although the representative from the Pacific Coast who attended this meeting had not been able to be at the previous meeting. This meeting was also successful in bringing out some additional information for the report.

Studied Water Heating Tests

In addition to some work in the field, water heating tests from various sources have been studied. A short but comprehensive questionnaire has been circulated to various companies, who are known to be supplying a considerable amount of water heating service. Tests have been standardized so as to make them truly comparable.

Arrangements have been made for tests to ascertain diversity for various kinds of water heating equipment. The first of these tests is being made in Seattle. This part of the work will not be completed for some time, owing to the limited number of instruments available.

The material for the body of the report is well in hand, so that we expect to have the main part of the report, exclusive of the diversity tests, ready for publication at a comparatively early date. If the report is made at an early date, of course, the diversity tests and some incidental information will need to be carried over into next year's report, which should be supplemental to the main report now being prepared.

REPORT OF DOMESTIC ELECTRIC RANGE COMMITTEE

By F. A. COUPAL, *Chairman.*

(For Committee Personnel, See Appendix 4)

At the first meeting of the Domestic Electric Range Committee in New York on Oct. 15, 1928, it was very definitely the unanimous opinion of the Committee that the excellent work of the 1928 Electric Range Committee meetings be continued, especially with reference to promoting a greater interest in the "Plan for Electric Cookery."

A complete resumé of what has been accomplished convinced the Committee that a compilation of pertinent information, relating to the advantages of the electric range, would be acceptable, provided it was put in a brief and readable form. The Committee addressed itself to this problem, and at its meetings on Feb. 5, 1929, in Detroit, and on March 21, at Chicago, was developed and completely outlined this year's report, which will be issued at the Atlantic City Convention in June, under the title of "Marketing Electricity for Domestic Electric Cookery."

The work of this ambitious publication was divided among a number of subcommittees, and it is with considerable pride and pleasure to inform you that these Committees have worked very carefully and faithfully to the end that a creditable report will be produced, and in the opinion of many of the Committee will be accepted as a report concerning electric ranges, which every commercial manager and sales manager, as well as executives of the various electrical and combination utilities, will desire to have available in their offices for reference.

This report is not the work of one man, but the work of some twelve individuals, all of whom have had considerable experience in their special lines.

It was hoped, however, that it might be possible for some spectacular presentation of the report to be made at the convention in order to direct the attention of those interested in commercial activities toward this important report, but unfortunately the procedure for the presentation of the commercial program prevented any such presentation.

However, the Committee through the Commercial Director, Mr. C. E. Greenwood, has been permitted to make an attractive and interesting display in the commercial booth, which will be on the stage of the new auditorium at Atlantic City, and although it will not be as dramatic a presentation as had been planned, it perhaps will fulfill the purpose of directing, as much as possible, the attention of those attending the convention to the Committee report on electric ranges.

Furthermore, plans are now in the making, so that all the range manufacturers who will exhibit at the new auditorium in Atlantic City shall cooperate to direct attention to the report, for the manufacturers themselves are firmly convinced that the report should answer any reasonable question which might arise with any utility considering the advantages of the use of the electric range.

In conclusion, I desire to particularly call attention to the splendid cooperation given the Range Committee by the S. E. D. through Kenneth McIntyre, who placed at the disposal of the Committee George Jaquet, who has made possible the collection and briefing of an immense amount of data, as well as formulating the outline for the presentation of the report, as it will be in its final stage.

REPORT OF MERCHANDISE SALES COMMITTEE

By C. L. HAROLD, *Chairman*

(For Committee Personnel, See Appendix 4)

The Merchandise Sales Committee has advanced the work of the preceding year with the following objectives which have been pursued by the respective subcommittees:

Merchandising Advertising
Oil Burner Sales
Quality Standards
Radio Merchandising
Trade Relations.

In addition to the continuation of the foregoing activities, a new subcommittee of great importance, namely the Subcommittee on Electric Farm Equipment, was created and has already prepared a report, to be printed in serial form for general distribution during 1929. The activities of this subcommittee have produced for the guidance of all member companies interested, much valuable data which the published report will contain.

Farm Equipment Sales

The electric farm equipment market is being explored by many member companies, and the Committee is endeavoring to discover and present to the industry the most effective methods of building this type of load. Its scope, for convenience, includes not alone appliances for use in farm residences, but all practical equipment for farm operation generally. It is recognized that the development of this farm business calls for specialized attention and specialized men for promoting the sales. At every point in its work, the Farm Equipment Subcommittee is closely cooperating with the Rural Service Committee of the N. E. L. A., from which latter group two members have been drawn and assigned to the Electrical Farm Equipment Subcommittee. While the farm market development is not an engineering job, the subcommittee has concluded that the salesmen employed by the power companies must be equipped with extensive experience or training so as to talk the language of the farmer and adapt themselves to the practical needs of the farmer. This is one of the reasons why the selling activities should be so closely related to the rural electrification work of the utility.

Data in Committee's Reports

The forthcoming report of the subcommittee will contain charts showing how the power company should organize for farm salesmanship. It will point the way for various companies differently situated in the country at large. The subcommittee will list all the applicable publications which should be read by salesmen to better fit them for handling the market. All data as to performance value of various farm issues now on the market, and which may be placed on the market from time to time, will be assembled and a description thereof included in reports to be made available to member companies.

It is believed that this phase of the work can be best handled by the Geographic Division Subcommittees, most of which have already been formed and are functioning in close cooperation with the National Subcommittee.

The National Subcommittee will act as a clearing house for information concerning, and criticisms of, equipment having objectionable features which should bar them from the approval list until the manufacturers, having been informed of such criticism, may remodel their products or correct them. The subcommittee deems it exceedingly important to push the sale of only the apparatus which gives reliable and satisfactory service. It is recognized that the farmer, unless safeguarded against disappointing electrical machinery, becomes a hard prospect after experiencing or learning of inferior machines being tried out.

Typical analyses of farm appliance markets are to be made and presented to member companies by the National Subcommittee, indicating the basis on which sales should be made and credit extended as determined by the kind of crop or product of the farm territory comprising the market. Formulæ are to be developed for determining the purchasing power of farms in various sections of the country and of the territory covered by the particular member company.

Advertising

Besides the customary concurrent advertising program, the Subcommittee on Advertising is undertaking to relate more intimately the advertising men and appliance managers. It is deemed advisable to develop a better understanding of their mutual problems. Conferences through possible joint committees are to be encouraged with the hope that appliance advertising methods may be adapted to the exact though changing sensibilities of the user of domestic appliances. Also, a unique kitchen calendar, tying in with the concurrent advertising schedule, has been prepared by this subcommittee and will be made available for 1930.

Radios

The Radio Subcommittee has expressed the belief, after careful consideration of the experience of many member companies, that with the stabilization of radio sets, merchandising by central stations of this class of electrical goods may be undertaken with advantage in building load. This subcommittee expects to assemble data showing the trend of experience by central stations which have already engaged in this class of merchandising.

Oil Burners

The Subcommittee on Oil Burners is preparing, and will make available during the current year, a commercial supplement to the oil burner report prepared by the previous committee. The basic report has been of great value in reviewing the technique of oil burners, performance, load value, etc., but did not provide what the pending supplementary report will undertake to do, namely, canvass the marketing methods showing the salability of electrified oil burners. Considerable effort has been expended by this subcommittee in assembling this information from all parts of the country.

Quality Standards

Much study has been devoted by the Subcommittee on Quality Standards of Merchandise to determine whether it would be wise to attempt to develop and promulgate minimum standards of quality for electrical goods. Several of the leading manufacturers of electrical appliances responded to questionnaires on this point. While many of them responded to the idea of possibly setting minimum standards as to the .performance of various popular appliances, the subcommittee is not yet prepared to go further with any recommendation other than to adhere to standards which will reasonably insure the safety of apparatus in respect of fire and life hazards. Such insurance, in large measure, is automatically vouchsafed by the approval of the Fire Underwriters Board and compliance with the National Code.

Trade Relations

The Merchandise Sales Committee has encouraged, in its several meetings of the Merchandising Bureau and in conference of the Merchandising Bureau and Commercial Section, the adoption, so far as practicable, by member companies, of the declaration of merchandising principles, jointly subscribed to by the N. E. L. A. and various national dealer organizations, as to fair competition and ethical salesmanship. It will continue to further such trade relations without attempting to police the industry, but constantly reminding member companies of a certain moral obligation to maintain wholesale trade relations on the basis of cooperation.

CHAIRMAN SAMPSELL: I think you will all agree with me, after hearing the three reports by Messrs. Tallman, Pembleton and Kennedy, that this Commercial Section has been in good hands this year. I wish to thank each one of them here because I have not had sufficient opportunity in introducing them to do so.

It would be a very great honor to us if Mr. Swope, Mr. Martin J. Insull, Mr. Freeman and Mr. Groesbeck would take the seats that are being vacated by the Vice-Chairmen. I should like you with us. I am not going to say one word of praise about any one of these gentlemen because if I tried to do it, if I were able to properly do it, I would spend the time that they have been good enough to come here to devote to this great, inspiring meeting.

[The above-named gentlemen came to the platform. Applause.]

CHAIRMAN SAMPSELL: The next gentleman, Mr. Zimmerman, who talked this morning at the General Session—and we consented he should again talk because we believe it is of most importance that he give his message to everyone—has agreed with me that he would not get overly enthusiastic and take more time than the schedule formally gives him.

I have great pleasure in presenting Mr. Zimmerman to you.

NATIONAL FOOD PRESERVATION PROGRAM

BY P. B. ZIMMERMAN,
Secretary, National Food Preservation Council

In a recent radio address, Dr. Royal S. Copeland, formerly the Health Commissioner of New York, now a United States Senator, and a man who is closely followed because of his writings on food, and particularly health, made the statement that millionaires had offered great fortunes—Woolworth buildings or practically anything within their reach—if they could be given an extension of ten years of life, that by listening to a very simple recipe he would guarantee an extension of many years to the average individual. His recipe was this: Make certain that the food you are to eat is kept in a good container maintained at a temperature of 50 deg. or below.

He further stated that small, hidden enemies have caused most of the grief of the world, the germ life of which we know little, and it is the germs that have not been perceptible to the human eye that have been the cause of much of our ill-health.

Progress Made in Refrigeration

We have made a great deal of progress in refrigeration. Some 40 per cent of the American homes have refrigeration of some type; some 6 per cent have electric refrigeration. The family food bill is some $629, and we have a tremendous wastage sufficient to pay for all refrigeration costs if we could make this saving in food stuffs.

It was with these facts before them that the Refrigeration Committee of the Commercial Section suggested the program we have been discussing today. The National Food Preservation Council as it is now organized and incorporated, consists of Matthew S. Sloan, President; J. E. Davidson and C. E. Greenwood, Vice-Presidents, and Mr. Marshall E. Sampsell as Chairman of the Executive Committee. Associated with them are representatives of a new group to this industry, the food industries. They have invited to sit on this board representatives from the American Medical Association, American Federation of Women's Clubs, the Ice Industries, the Ice Cabinet Manufacturers, the National Dairy Council, and many other groups that are interested in this common development work.

The activities as shown in the folder that will be given to you are suggested both for national and local work. A fund has been created by the national manufacturers interested in the movement to defray the expenses of the national offices in the preparation of material that will be helpful to local activities. The campaign is essentially a local one. The time has been set for the month of September, at which time it has been suggested that local Food Preservation Councils be formed, composed of the utilities, the ice people, the milk people, the refrigerator dealers, and any other local interests that may want to participate. Those groups will endeavor to make their residents conscious of a food temperature.

The specific aims of the program, as given in the prospectus, are as follows: First, to establish the cause of food decay and bacteria growth; second, the relationship between food spoilage and health; third, the vital necessity for proper, all-the-year-around refrigeration; fourth, to establish in the public mind a perishable food temperature of 50 deg. or less.

If we could boil this down to an insignia, and could so present it to every electric customer in the United States, one that would be emblematic of this design before you, so that the customer would feel that a food temperature of 50 deg. for health is just as important to them as a heat temperature of 70 deg. for their comfort, then we would have accomplished much. So about all that has been suggested in the Refrigeration Committee is that we pool our resources, all our activities, and we support the National Electric Light Association in this one-month campaign in September, in presenting to the public this story of the relationship between better health and food conservation and preservation, and, to make it specific, we definitely establish for all time a food temperature.

Yesterday the Regional Directors were organized. The country is divided into twenty sections. We will have their sponsorship and activity in each district. We believe we will have the active cooperation of the Electric League in the larger cities. At the National Headquarters office will be ten specialists who will become field assistants to the Regional Directors and will endeavor to help them organize local groups.

An avalanche of publicity material is being prepared. National advertisements and all types of local material on the food temperature will be distributed by the millions, all tying up into an interest-getting contest in which $25,000 has been appropriated for a model home, a Cadillac car and many other worthwhile prizes. We should have at least 1,000,000 essays submitted in this contest.

We have an opportunity of working with the food industries. They are a fine group and they are carrying on a fine work of their own. If we work with them I believe we can form a permanent association. They can help us very much in our other work, and they will assist us in this. We ask everyone to make it their business to inquire locally as to who will head the Food Preservation Council in the city in which he resides. We solicit your most active cooperation. (Applause.)

CHAIRMAN SAMPSELL: It is my very great pleasure to merely mention the name of the next speaker, Mr. Gerard Swope, President of the General Electric Company. (Applause.)

FROM THEORY TO ACTION

BY GERARD SWOPE
President, General Electric Company

When Mr. Sampsell asked me to speak before you, it seemed to me that I had a good deal of boldness and temerity to come before you and talk to you about your job. I began to think what I should say and tried to put myself in your place to see how I would try to develop a business if it was my responsibility to do so. Then I listened yesterday, and especially this morning, to the very illuminating and magnificent addresses of Mr. Sampsell and Mr. Sloan, and I came to the conclusion that you do not need any thoughts of mine; you know the theory, all you have to do is to play the game. It boots us but little if we know what is required of us if we don't do it, and that seems to me the situation.

The figure Mr. Sloan gave, showing the average consumption of kilowatt-hours per family in the United States being 456 per year, was even smaller than I had thought. Really, in a way, if you will allow me to speak frankly, it is an indictment of the industry that we have done very little to establish ourselves in the home.

Then Mr. Sloan went on to say that one company, or several groups of companies, had sold 735 kw-hr. per year per family; in other words, a range of 65 per cent. If the first figure is an average and the second figure of 65 per cent bigger, I do not need to tell you, even if you are not expert mathematicians, that there must be many central stations that are selling even less kilowatt-hours per year than 456.

Of course, it would be out of place for me to mention anything about rates, inducement rates or anything else. It seems to me again that one need not do anything further than to read the papers that have been presented. If you gentlemen didn't hear Mr. Sampsell and Mr. Sloan, I urge each one of you to read their papers. I hope they will have a very wide and careful consideration because therein is expressed the fundamental theory of central station development of kilowatt-hour consumption in the home.

Education, Price and Cooperation

Therefore, assuming that you know the theory, then there is only one thing to do, and that is to do it. I am only going to mention three points, and in this order: Education, price, cooperation.

By education, I mean the education of the public to the use and advantages of electrical appliances in the home. I believe it is of greater service and value to the public service company to give a specific illustration of how electricity can help the family, than it is to have institutional advertising to tell the virtues of the central station and the fine service that it is giving. In other words, if you will be concrete, definite and specific, and the rate structure has been fixed so that every family can have a range or a washing machine, or a refrigerator, or a vacuum cleaner, or other household conveniences, then it seems to me you will be carrying the message right home very definitely to the family itself. If you do that you will be showing initiative and energy, and it will be convincing to the families themselves that you are really seeking to give better service and to a larger part of the community.

Furthermore—of course education has another effect—it stimulates the industry. It singles you out as a leader, because then people recognize that you are trying to do something constructive, that you are trying to make two blades of grass grow where maybe none grew before; that you are trying to induce people or lead people to see the advantages of electrical service in the home, not to advocate necessarily any particular appliance, though the advocacy of any one is better than none, but to advocate the use of electrical appliances in the home.

The Question of Price

Second is the price. There has been a good deal of discussion, and maybe there is some difference of opinion, and if I speak quite definitely, for I believe in what I say, please bear with me because I am speaking from my standpoint and from my experience, and I may be wrong from the viewpoint of a central station. I think in setting a price for electrical appliances, if the central station is going to sell them it should take into consideration all the elements of cost, including the education I have spoken of, which is advertising, and then furthermore allow a margin which is a reasonable return on the time, on the effort and the investment in this part of the business. The public do not ask that we give them anything for nothing. They are perfectly willing to pay for service rendered. Neither do they ask for inducements for them to buy electric appliances. You haven't any better demonstration of that than the way in which big automobile companies and others have built up their business on a perfectly definite price basis which has left them a reasonable margin for a return upon their investment and their effort, because without that of course they couldn't go forward and make improvements in the art, and be of greater service.

Nor is price the sole and only consideration from the standpoint of the public. Remember what a man from Missouri once said, that "The remembrance of quality remains long after price is forgotten." It is the character of the appliance and the service that is given that is immeasurably of more importance than the first price. There are so many people in this country with the high standard of living we have now who can afford to buy appliances on a reasonable price basis, that one need not worry about the first cost standing in the way of use.

Very much more important is the rate structure than the initial price of the appliance, because the appliance you sell but once—if it is good. The rate is a continuing source of revenue for the public service company. I think if these two elements are rightly considered—and other elements such as terms of payment for appliances spread over a period of time, but not so long as to be unsound; indeed, the central stations might offer financing service on time payments for appliances used on their lines irrespective of whether the purchases are made from the central stations or from dealers in their community —if these are well done, then you do not need to worry about cooperation in the industry; you will have it.

Mr. Sampsell spoke very eloquently of the cooperation of the four arms of the big electrical industry this morning. He has been sincere in the time and effort he has given to bring it about. But cooperation will never result unless you have a reasonable satisfaction on the part of each branch of the industry represented in the group, and the best basis of reasonable satisfaction is to have the central station take the leadership in the education of the people by advertising the advantages of the use of electric appliances; secondly, that its price should be so made, including the reasonable margin and the return upon the investment I have spoken of, that other branches of this large industry may also sell their particular appliances in the same market.

Remember this: That although the central station, rightfully it seems to me, enjoys a public franchise which gives it 100 per cent of the business of serving the public, there is no organization on earth, no matter how efficient, no matter how good, that will ever sell all the merchandise in a community. There will be differences in taste on the part of the public that you serve, even if there may not be differences in quality of the apparatus that is sold. Different manufacturers are going to bring out their wares and are going to seek their market. They are doing a national campaign of advertising. It is for the central stations in their particular fields to back up that advertising and bring it home to the particular householder in his territory.

As I said, no central station, no matter how efficient, will sell it all.

Recognizing these various elements I have spoken of, if you can take the leadership in the educational campaign, then really the work of the electrical leagues is done. You won't have to preach cooperation then because they will recognize that you are practising it, that you are giving each man a chance, each company, each branch an opportunity to serve as best it can. Then, it seems to me, will the central stations take their rightful position of constructive leadership, of an educator of the public, putting the sales on a basis where all other parts of the industry can cooperate with them to the full, so that the ideal may be reached of not only a greater kilowatt-hour consumption per capita, but also through the cooperation of the group, as Mr. Sampsell has said, we can look forward to a greater use of electric appliances in the home and in the workshop, which means, of course, greater comforts and conveniences, and greater efficiency.

You know the theory. Will you do it? I thank you. (Applause.)

CHAIRMAN SAMPSELL: Now, another name, and that will be enough. My good friend Mr. Martin J. Insull, President of the Middle West Utilities Company. (Applause.)

SELLING DIVERSIFIED KILOWATTS

By MARTIN J. INSULL

President, Middle West Utilities Company, Chicago, Ill.

My feeling this afternoon is one of congratulation to you because, first of all, if anyone asks me what was the keynote of this convention I think I should have to reply, "Commercial Development." Therefore, I think you are to be very much congratulated that your branch of the business should take such a prominent position in one of the most successful conventions that this association has ever held.

I was particularly impressed this morning with Mr. Sampsell's report for the Commercial Section, and if I caught his thought correctly, what he had in mind the Commercial Section should do was not only to sell kilowatts but to sell diversified kilowatts. It seems to me there is a very considerable difference between the selling of kilowatts and the selling of diversified kilowatts. Fundamentally, as our business grows, if it is properly handled the price of our service should go down. On the other hand, if our business grows and it is not properly handled, the price of our service has to remain about the same. The only way we can properly handle our business is to be sure that we are taking on diversified load.

Mr. Sampsell also referred to cooperation, particularly to cooperation outside of our own particular industry, and yet it brought to my mind that what is needed as much as anything else at the present time is cooperation inside of our industry, cooperation between the commercial departments and all the other departments of the various operating companies, so that they may be all working toward the end that the tendency of our business is such that we may continue to bring our rates down.

I was particularly impressed with that point of view from the figures that Mr. Clapp used yesterday, and Mr. Sloan again used this morning, and that was that in 1922 this industry had $4.72 invested for every dollar of income, and yet in 1928 that figure had increased from $4.72 to $5.58 per dollar of income. I have thought a great deal about those figures since yesterday morning, and I am wondering if some of the trouble that is represented by those figures is possibly due to the fact that we have not paid enough attention to the selling of diversified kilowatt-hours, and have been satisfied just to sell kilowatt-hours.

It seems to me you may be congratulated from another point of view in that you commercial people are just about on the edge of where you have got to pay more attention to the fundamental economics of this business than you have to purely getting orders. Therefore, your position is going to be a very much more prominent one in the future of this industry than possibly it has been in the past. I do not want you to misunderstand me in any sense. The work you have done in the past has been a great work for this industry, but it seems to me, sitting here today and yesterday listening to Mr. Clapp and to Mr. Sampsell, that your work in the future must be of a higher grade, more scientific, more economic work than you have been engaged in, and that the cooperation to which Mr. Sampsell referred will be a cooperation between you, the financial departments and the operating departments of your companies, and in those conferences your position in the future will be found more important than it has been in the past.

Therefore, I feel that I can congratulate you. It flashed across my mind this morning that possibly I had been thinking that way a great deal before I came to this Convention, but having the privilege of hearing these things talked over, it crystallized my own thoughts in my own mind. I remember only a few weeks ago I picked up what is known in our organization as the *Intercompany Bulletin,* which is published every week, and always contains a record of the various commercial departments of our different operating companies. It sort of staggered me when for two weeks running I noted that the aggregate commercial business of our operating companies was running something over $300,000 a week. It rather scared me, and I wondered what it would lead to. Was it the right kind of business?

After I had seen that I went to our commercial manager and I said to him, "Mr. Eaton, the men who work on all our various operating companies understand kilowatt-hours. They understand we want the right kind of kilowatt-hours so that our load factor is not torn down."

"Yes, Mr. Insull," he said, "we are giving great attention to that."

That rather satisfied me.

You gentlemen have got a great opportunity before you. Bear in mind that one of the greatest charges against this industry is interest, and when the investment per dollar of income goes up, interest goes up. You gentlemen in the commercial departments, if you carry on your business based on good economic principles you can keep that interest down.

Again I congratulate you on the important part that your Section has taken in this Convention. I see in it that same ability for organization and negotiation of your Chairman which has been of such help to me in the last seventeen years. (Applause.)

CHAIRMAN SAMPSELL: That last sentence was thoroughly unexpected by me, but nevertheless has affected me very deeply.

It is our pleasure now to hear from another gentleman whose name is enough, Mr. C. E. Groesbeck, President of the Electric Bond & Share Company. (Applause.)

COMMERCIAL DEVELOPMENT

BY C. E. GROESBECK

President, Electric Bond & Share Company, New York

Vice-President Owens said when he entered this box yesterday that he was nervous, very nervous. I have never had an opportunity of standing in a pulpit or in the prisoner's box before. I will probably never stand in the pulpit. (Laughter.) If any of you think Mr. Owens was telling you an untruth, just come up here and take my place.

This convention has been, so far, the most interesting one I have ever attended. It has been such in my opinion because a large amount of the work has been devoted to the business development end of our business, that is, the commercial end, and, after all, it is the commercial work that makes all the rest go. If we do not have good commercial policies, if we do not get new business, and if that new business isn't profitable, the rest of us, the engineers, the management, the financiers of the company are helpless in our efforts to make our companies grow.

Getting back to this radio thing for a moment, this is my first experience, and I hope if this is going over well I will get a few post cards telling me so. (Laughter.)

Many interesting statistics have been presented to us. They are sometimes tiresome, but, after all, they form the background of our history and give us the basis for our work in the future. I do not know that the following facts have been brought out, so I am going to take the liberty of citing a few figures to you.

For the year 1917 the gross operating revenues from all of the central stations in the United States amounted to $521,000,000, while for the calendar year 1928 this figure was $1,980,000,000, an increase of $1,459,000,000, or 280 per cent from 1917 to 1928.

The light and power customers increased during this period from 7,178,000 (I will leave off the odd hundreds) in 1917 to 23,400,000 in 1928, an increase of 16,000,000, or 69 per cent.

The interesting thing to me—and I think it will be to you—is that while our consumers increased 69 per cent our revenues increased 280 per cent. Now we all know there have been very material reductions in rates during that same period, so I think this shows impressively the result of the work the members of this Commercial Section have been doing. The business per consumer has increased, rates have gone down. We have had a very satisfactory increase in number of consumers and a more satisfactory increase in dollars revenue.

Mr. Sloan gave us some very interesting capital expenditure figures this morning, but it must not be assumed by anyone that this increase of $1,459,000,000 or anything like that amount represents an increase in distributable net earnings. It is the increase in gross earnings, and a tremendous amount of new capital had to be expended to get that increase.

The census shows that in the year 1919 the total horse power required to operate all the industries in this country was 28,297,000, of which only 31 per cent, or 9,200,000 h.p. were driven from central station service. For 1928 the comparable figures are total horsepower for the nation 39,040,000, of which 19,144,000, or approximately 50 per cent of this power, was derived from central station service. In other words, over the period from 1919 to 1928 the use of central station power for industrial purposes increased from 31 per cent to 50 per cent—another very satisfactory showing for the members of this section.

All of this indicates that the commercial departments, the new business departments, of this industry have been doing a wonderful work. These figures also indicate, particularly the last figure I have given you, whereby we find that only 50 per cent of the industrial power used in the country today is from central stations, that we still have a tremendous job ahead of us. Most of our companies, I think, are well organized in their efforts to get after the industrial power, the motor load. It is big enough to be spectacular, and warrants special attention.

I am very interested in seeing that one of the principal themes of this convention is the building up of load factor on residential consumers. That is where we are going to get our most stable business. The residential consumer forms the backbone of our business. If times are bad, the industries may drop off and curtail manufacturing, curtail output, and consequently curtail the use of power, but the household use must go on, and does go on. The household business can be increased with much less new capital investment per dollar of gross earnings than usually can the power consumer, and that is very important to the company and to the financial end of the company.

The Inducement Rate

We have heard at this Convention much about the inducement rate. It is the thing that is going to encourage the more general use of electric appliances and electric energy in the household. It is a subject we should all give great thought and study to. Rates are closely involved with the question of politics and policies. The man who wants to attack the electric company and get some newspaper publicity starts in on the top rate. The nature of our business is such that it is very difficult to explain to the public and have them fully understand that we are rendering a service, and that we are not selling a commodity. The average man will understand what you mean when you say you want your dollar to earn interest all the year round, and not for two or three hours a day, and not on Sundays, but he overlooks the fact that we have got these dollars in plant and property, and that we must pay our charges on them, our interest and our dividends for twenty-four hours a day, 365 days in the year, whether he uses any service or not. He would like to pay on a kilowatt-hour basis, but in order to serve him on a kilowatt-hour basis we would, as you all know, have to charge small householders such a high rate that it would discourage or prohibit the use of appliances and even lighting, and would also subject us to very severe attack on the part of those who through lack of understanding or from ulterior reasons are prone to deal with top rates only.

The Political Factor

The political factor, the public relations factor of the inducement rate is to my mind just as important as the inducement of new business. If your top rate is 15 or 16 cents, and the people read in the paper that some large city is getting a 7-cent, or an 8-cent rate, the fellow that wants to attack you starts in on your top rate regardless of what the real facts and equities are. Considering the value from every point of view of our service our rates have always been attractive. We are still getting them down. We are rendering the cheapest service the householder gets, and we are now beginning to state our rate schedules in forms the householder can understand. Of course, we must protect our investment, and that means on these inducement rates a higher demand charge, or some sort of a fixed or minimum charge to protect us against the customer with a large connected load and a low load factor.

I am sure all the members of your Section, Mr. Sampsell, have all this in mind, and that they are all working accordingly. We can get more dollars of revenue with less capital investment from the increased use of these appliances; we can get a more stable business than from any other department of our industry. I hope your Section will foster this inducement rate, and work in conjunction and cooperation with the rate departments of the companies and of this Association to accomplish that end.

Thank you very much. (Applause.)

CHAIRMAN SAMPSELL: It struck me that perhaps some of you may not have arrived here early enough to see our President, and with the help of Mr. Insull who went out and recovered him (I saw him escaping), we brought him back to the platform. It is a great honor to introduce Mr. Arkwright, our President, to you.

PRESIDENT ARKWRIGHT: It has almost come to be an obsession with me this matter of having these meetings meet on time, move rapidly and adjourn shortly. I would not spoil that record by attempting to make any kind of a talk.

I merely want to call your attention to the fact that Mr. Sampsell was Chairman of the Commercial

Section before he was a Vice-President. The Nominating Committee of this Association selects ordinarily the Vice-Presidents, who, generally, if they behave themselves and are not found out, succeed to the presidency after a while, but this particular year one of the Vice-Presidents resigned and I nominated Mr. Sampsell myself. So I know he is a good one. (Applause.)

Also, by the time he gets to be President, when he has served the Commercial Section for a year and gone through all the others, he is going to be the best qualified President the Association has ever had.

I also am glad to be here to see the verification of what our idea was, that if we did not run these sectional meetings in parallel we would give opportunity to people to come where they wanted to come, and they would be here. Your presence proves the wisdom of that plan. I do not believe there has ever been so large an attendance at the Commercial Section. We are having a wonderful Convention. Everything seems to conspire for good.

A gentleman met me on the Boardwalk and said. "Arkwright, you certainly are in luck to have this wonderful new Auditorium open for your convention."

I said, "What do you mean luck? That wasn't luck, that was planned and designed. You don't think they could build this house in a night! We started it three or four years ago and finished it just in time for this convention, not too late for it and not too early that someone else could meet in it first.

"Well, it was designed. If you think it was an accident, then how do you account for the fact that it is located on Georgia Avenue?" (Laughter.)

Then he said, "The sun is shining brightly this week, and you know that must be an accident."

"Oh, no, not at all," I said. "Look at the electric lights we have, the wonderful lighting in the room, the great display of lighting on the Boardwalk. Why, the sun didn't want to be put to shame, and all day long he has been shining his brightest. No luck about that."

I only come to indicate the interest of the Association in the Commercial Division, and only for that purpose, and not to make a talk. I do not care what the industry is, or what the enterprise within it is, or how large it is, or what its past reputation is, or anything about that, if it loses, or if it doesn't possess an active, energetic spirit, it is on its last legs. I am firmly convinced of that, and I know, therefore, or, rather, I believe, therefore, that there is no more important activity in the electric light and power industries and its companies and this Association, than a continued, intelligent, energetic, enthusiastic commercial spirit throughout the organization. That is what you are engendering and pushing forward, and I come only to make acknowledgment of your contributions to the industry and this Association, and to thank you so far as I am permitted to thank you for it. (Applause.)

CHAIRMAN SAMPSELL: Now, another name, Mr. W. W. Freeman. Although he has many titles, it is my pleasure to introduce him as President of the concern where he does not get any money for bread and butter, The Society for Electrical Development. (Applause.)

THE ELECTRICAL INDUSTRY SALES CONFERENCE

BY W. W. FREEMAN,

President, The Society for Electrical Development, Inc.

Please understand at the outset that I am not in competition with the speakers who have preceded me. When these gentlemen can be brought together to discuss any subject, it is needless to have anybody follow them and undertake to say anything they have left out, or to add to what they have said. My task is slightly of a different character. They have undertaken to completely answer the why of this commercial problem, and I am certain that after you have heard them and the speakers at the previous sessions, no one can possibly raise the question of why we should be concerned in furthering our commercial activities.

The job that has been assigned to me for a few minutes, as I understand it, is to talk about the how of the problem rather than the why of it. Mr. Sampsell had the precaution to send me very specific instructions, stating what he was asking me to say at this afternoon's session, and taking no risk that I would not be advised as to these instructions, I have his letter stating at this afternoon's session of the Commercial Section, Mr. Freeman, President of The Society for Electrical Development, will discuss the present status of this plan, referring to the industry's sales conference plan; "its value as an agency for intensive development of our market; its advantages as a messenger of good will, and its far-reaching benefits to all elements in the electrical industry." With that as a text and my instructions, and with ten minutes allowed me, of course the task is easy.

I am also instructed to make a report concerning this industry's sales conference plan, and I have been handed since arriving here this morning a half dozen or so documents that might properly constitute that report. I have only been able to glance through them and pick three or four that I think should be mentioned as evidence of the rapidity with which this work has been carried on, taking into consideration its great scope and its importance.

More than a year ago the plan was conceived of forming an industry sales conference in which we could focus the experience and the judgment of the various branches of the industry in formulating an effective and sound plan for saturating the homes of our country as rapidly as may be possible with electric service. Each branch of the industry was invited by The Society for Electrical Development, that being the organization which seemed perhaps closest to these various branches of the industry by means of its structure, to designate official delegates to such an industry conference. Those delegates were appointed.

They found shortly after they began their studies that in their opinion they needed information which it would take time and money to acquire, but which in their judgment was essential to the formulation of a sound plan. That work was financed, and an agency was engaged to make a survey according to the ideas of the members of this conference. It took months to complete that survey. A report was submitted to the members of the industry sales conference, and by them to the directors of the Society under date of Jan. 16 last. I want to read just two extracts from the report of that survey:

Purposes of the Survey

"Among the specific purposes for which it was planned are the following:

"1. To learn the adequacy with which typical American homes are wired: ,

"2. To find the number and nature of electrical appliances in the typical household.

"3. To study consumer interest and appreciation of the value of electricity.

"4. To determine ways and means to develop a large market for electricity in the homes of America."

Here are five conclusions following the months occupied in making that survey in enough cities in the United States to represent really a cross section of the country:

"1. The American home offers a large, undeveloped market for wiring, electrical appliances, and an increased use of electrical current.

"2. There was no evidence that the housewives interviewed had ever been approached with any plan to introduce into the household the use of electricity in a comprehensive way.

"3. The appliances most aggressively advertised and merchandised had by far the widest distribution, pointing very definitely the way by which the market can be cultivated for much larger purposes.

"4. Inadequate instructions to educate the housewife in the effective use of the appliances she possesses is generally reflected in many abandoned appliances found in the homes.

"5. The absence of a rate graduated to volume is not only discouraging toward the acquisition of more appliances, but productive in many cases of bad feeling toward many of the central stations."

With a survey along those lines the industry sales conference undertook to prepare a specific plan for promoting sales in the household. They submitted that plan on Jan. 1. It developed in a discussion of the plan between the members of the industry sales conference, some 25 men, the best commercial men that could be picked, representing the several branches of the industry, and the directors of the Society, which also represented the various branches of the industry and had the benefit of the presidents and the managing director of each of the national associations on the board, that there was some difference in viewpoint, as one would naturally expect, with regard to certain features of the plan.

Subcommittees were appointed to discuss the matter further, a committee from the directors and a committee from the industry sales conference, Mr. Sampsell acting as chairman of those combined subcommittees.

Those committees made a report again to the directors under date of May 10, and further reported at another meeting which was held yesterday, and following those reports this resolution was adopted by the directors of the Society:

"On motion seconded and unanimously carried, the modified program as submitted was approved in principle, and the committee continued with Mr. J. E. Davidson added, with instructions to complete the advertising copy, supporting literature, the details of local tie-in plan; submit the complete plans to the several associations; make recommendations as to financing and proceed with the securing of the underwriting of the national fund required."

I must try to condense the rest of this in just as few minutes as I possibly can.

What I would like you to understand is that we are very near to the culmination of a very sincere and a very definite effort to focus, as I said before, the experience and the judgment of our industry in all of its branches, into the best, most effective, most definite plan which can be generally followed in our various communities in promoting increased sales of energy in the households of our country.

Approved Plan Will Be Definite

If this plan is not workable, it will be because the industry itself hasn't the capacity to develop such a plan. Any such suggestion as that is, of course, unthinkable because we know we have. This plan when submitted, as it will be in a very short space of time, for complete operation throughout the year 1930, will be definite and will have the specific approval, before presentation, of the official boards of each of the branches representing the various divisions of our industry.

It will be a plan which each of those divisions of the industry has passed judgment upon favorably. It will be specific and definite, and the how of solving this problem will be suggested so that it can be carried out in your discretion in each local territory.

We have had suggestions in past years of possible conflicting interests in the industry, that what the central station people think should be may conflict with the best interests of the manufacturers, or vice versa, or of the jobber, or of the contractor-dealer. If this plan which is submitted is not accepted in good faith by individuals in certain communities as not being in line with their best interests, it merely will mean that their judgment is in conflict with the judgment of the men whom they have placed in charge of the protection of their interests in their respective national organizations.

This program will represent an absolute agreement between these divisions as to plans that are sound, fair and reasonable, and plans which, if executed in good faith and with enthusiasm, will solve this problem that we are discussing.

I take very great pleasure, indeed, and very great pride in being able as the representative of these various interests to report the progress that has been made to date in the cooperative movement. The plan will be definitely presented, as has been stated, as soon as it is completed. Where we may fail in any of our local communities to realize the results that speakers have told us should be realized, the fault must rest upon the people in the various localities for their failure to take advantage of the judgment of the industry and of the tools which this Association, in cooperation with other associations, are prepared to furnish to them. (Applause).

CHAIRMAN SAMPSELL: With no desire to do other than exact justice to the gentleman who has just left the platform, I want to say that, when this plan is finally worked out and approved, it will be due more to him than to anyone else.

Mr. Earl E. Whitehorne of the Residence Kilowatt-Hour Contest Committee, will now announce the prizes.

AWARD OF PRIZES OF KILOWATT-HOUR CONTEST

By EARL E. WHITEHORNE

Residence Kilowatt-Hour Contest Committee

It is to be my very great pleasure and privilege to present $9,000 in prize money to the winners of the Commercial Section's Kilowatt-Hour Contest. To make the transfer of the money complete, and to demonstrate the fact that the Committee is letting go, no matter how much it hurts, I am going to ask those gentlemen who have been notified of their good fortune in this contest to come forward on the platform, please.

Two years ago at the Convention in Atlantic City the Commercial Section announced a contest to be participated in by Class A companies of the National Electric Light Association. The objective was to see how great an increase in average kilowatt-hour consumption per residence customer might be achieved by a competitive spirit in the industry. A purse of $9,000 was raised by small contributions from a large number of manufacturers who felt that this project would have a worthy influence.

Purpose of the Contest

There were two purposes in view. First, we wanted to focus the attention of the industry on the importance of the average annual consumption per residence customer as a measure of public service. Second, we wanted to stimulate a closer scrutiny, a closer comparison, between the average in one city and the average in another. The terms of this contest were as follows:

> That the competing companies should register with the Committee the average kilowatt-hour consumption per residence consumer, metered current, in their communities for the year 1927; then keep a record and report at the end of 1928 the average total kilowatt-hour consumption per residence consumer for that year. The greatest increase would indicate the greatest achievement. Companies competing were classified under three heads:
>
> Class A companies, those who in the year 1927 had an average total consumption per residence customer of 451 kw-hr. or over.
>
> Class B, those who had a total average consumption of 351 to 450 kw. per year.
>
> Class C, those companies who had an average consumption of 350 kw-hr. or under.

One hundred and fifty-seven companies participated in this contest, and the awards are six prizes, three first prizes of $2,000 each in cash, and three second prizes of $1,000 each in cash. The winners are as follows:

Cheney Power & Light Company

The first prize in the contest among the Class A companies, that is, the companies who in 1927 had an average of 451 kw-hr. or over, has been won by the Cheney Power & Light Co. of Cheney, Wash. This company, although operating in a small community, having a small number of customers, increased its average residence consumption from 491 kw-hr. to 686 kw-hr., a total increase in the year of 195 kw-hr. (Applause). I might say that this company entered the contest with considerable misgivings, because they had only 336 residence customers, but by the enterprise and energy that they displayed, and the good work that they did during the year, this result was achieved.

San Joaquin Light & Power Company

The second prize for the Class A companies was won by San Joaquin Light & Power Co. of Fresno, Cal., with an increase of from 625 kw-hr. in 1927 to 724 kw-hr. in 1928, a total increase of 99. (Applause).

In this class honorable mention is extended to the Portland Electric & Power Co. of Portland, Ore., for an increase from 760 kw-hr. in 1927 to 853 kw-hr. in 1928, a total increase of 93. (Applause).

Alabama Power Company

In the Class B group, being those companies whose average in 1927 was between 351 to 450 kw-hr., the first prize has been won by the Alabama Power Co. of Birmingham, Ala., for an increase of from 433 to 496, a total increase of 63.

Western Public Service Company

The second prize in Class B goes to the Western Public Service Co. of Scottsbluff, Neb., for an increase of from 387.3 in 1927 to 449.1 in 1928, or a total increase of 61.8. You will see that they are very close to the record of the Alabama Power Co.

In this Class B honorable mention is extended to the Durham Public Service Co. of Durham, N. C., for an increase from 437 in 1927 to 495 in 1928, or a total increase of 58. Honorable mention is also extended to the Southern Colorado Power Co. of Pueblo, Colo., with an increase from 387 to 441, or a total of 54.

Central Power & Light Company

In this competition between the Class C companies, that is those companies having in 1927 an average of 350 kw-hr. a year or under per residence consumer, the first prize is awarded to the Central Power & Light Company, of San Antonio, Tex., for an increase of from 256 to 415, or a total increase of 159.

Western Public Service Company (Texas)

The second prize goes to the Western Public Service Company, of Beaumont, Tex., with an increase from 264 to 367, or a total of 103.

Honorable mention in this class is extended to the Annapolis and Chesapeake Bay Company, with an increase from 331 to 431, or a total of 100, and to the Montana Dakota Power Company, of Minneapolis, Minn., with an increase from 314 to 398, or a total of 84. Honorable mention goes also to the Michigan Electric Power Co. of Lapier, Mich., for an increase of from 331 to 412, a total of 81. (Applause).

There will be published very shortly a complete report of this contest, in which will be listed the names of those manufacturers too numerous to read here, who have so generously provided the fund for this contest.

Analysis of Contest

There are one or two points I would like to make in closing. First, an analysis of this contest has shown that those companies that have recorded the best achievements have been those that were particularly fortunate in having the heartiest kind of executive support. Also, in every case, employee interest in the campaign was actively solicited. Every company who did an outstanding job was hitting on all six. By "all six," I mean these six selling points which seemed to be particularly stressed as effective in this campaign:

1. The stressing of heavy load builders.
2. Increasing the wattage of sockets.
3. Consistent, continued, cumulative campaign effort.
4. Coordination of home service department in these contacts with the home-maker.
5. An effective and consistent program of advertising.
6. A hearty and healthy degree of dealer cooperation.

I have here the checks. Is the representative of the Cheney Power & Light Company present? (Not present.) Then there's $2,000 left over for the committee.

Is there a representative of the San Joaquin Light & Power Company present? (Not present) Ah! another thousand for the committee!.

Alabama Power Company? (Not present) Now that's too bad. Where's our old friend Ash. Collins?

Western Public Service Company, Nebraska? (Present.) Well, that's better. I take great pleasure in presenting this prize to you, and I congratulate you, sir. (Applause).

Central Power & Light Company? (Present.) I take great pleasure in presenting this prize to you, and I congratulate you, sir. (Applause).

Western Public Service Company, Tex? (Present.) Splendid. I take great pleasure in presenting this prize to you, and I congratulate you, sir. (Applause).

CHAIRMAN SAMPSELL: I have asked Mr. J. E. Davidson to announce the winner of the Federal Electric Company's prize of $1,000 given for the best promotion of electrical advertising. After all, the success of this Section is largely due to the two hard years Mr. Davidson put in as Chairman, and to those put in by Mr. Lloyd and the respective predecessors. Mr. Davidson!

AWARD OF FEDERAL ELECTRIC COMPANY PRIZE

By J. E. DAVIDSON

President, Nebraska Power Company, Omaha, Neb.

The field of electrical advertising offers one of our major opportunities to build commercial load. The liberal offer of the Federal Electric Company to stimulate further interest in this phase of our lighting and sales work was, therefore, willingly accepted.

The Federal Prize is a Gold Medal to the Company, and $1,000 to the responsible individual of that company who made the greatest contribution to the promotion of electrical advertising in any one year.

As happens in most contests, my associate judges, Mr. Paul Holister, of Batten, Barton, Durstine & Osborn, advertising advisers, Mr. Earl Whitehorne, of the *Electrical World*, and I had difficulty in determining the winner. However, we were unanimous in our decision in declaring as winner a company that we often find in the prize-winning column of other achievements, the Edison Electric Illuminating Company of Boston. (Applause).

A close competitor for this honor was the Electrical Advertising Division of the Penn-Ohio Edison Company, which received honorable mention, and we cite the commendable activity of the New York Edison Company.

As chairman of the Judges, it becomes my pleasurable duty to award a gold medal to the Electrical Illuminating Company of Boston, represented here by its President, Mr. Charles L. Edgar, and to present a check of $1,000 to Mr. R. B. Brown, head of the Electrical Advertising Division of that Company. (Applause).

I wish that I might have the descriptive powers of Graham MacNamee so that I could describe to you the beauty of this gold medal. I might say in passing that it is so heavy that should I carry it into Wall Street I am sure it would have a stimulating effect on the stock quotations. (Laughter).

It is a very great pleasure to hand this medal to a gentleman of our industry who has done so much over a period of years, not only for the National Electric Light Association, and the Association of Edison Electric Illuminating Company, but also for his own company that has had an outstanding record for many achievements and operations in selling its service and merchandise.

It is with great pleasure, Mr. Edgar, that I present to you this beautiful medal.

Before I leave this "pulpit" I shall present to Mr. R. B. Brown the check for $1,000. I congratulate you both.

MR. CHARLES L. EDGAR: It is needless to say that we are greatly pleased that the Federal Award should be given to my company. In the promotion of the use of electrical advertising in our territory we have not alone directly promoted the use of the electric sign, but have taken every opportunity to improve the status of the sign manufacturers and our cooperation with them. Our local Associated Sign Craft have aided in every way in all our promotional activities, and we feel that the success is in a great measure due to our friendly relations with this group.

We thoroughly believe that at no time in the history of our industry has there been such an opportunity for commercial development as at present, and we will consider our achievement this year not a finished program, but part of a continuous business-building effort.

I accept this medal with a great deal of satisfaction. I am going to take it home with me and put it alongside the Coffin Medal which we were fortunate enough to win two years ago. I do not know what Mr. Brown is going to do with his $1,000, but as far as I am concerned he is instructed to divide it between himself and his eight or ten associates who actually have done the work.

I thank you. (Applause).

Nominations

CHAIRMAN SAMPSELL: Mr. M. C. Huse, will you kindly report for the Nominating Committee?

MR. M. C. HUSE: Mr. Chairman, your Nominating Committee has been given the task of submitting fifteen names from which will be elected the officers of the Commercial National Section. The names are as follows:

Marshall E. Sampsell, Central Illinois Public Service.

J. E. Davidson, Nebraska Power Company.

S. L. Nicholsen, Westinghouse Electric Mfg. Co.

T. O. Kennedy, Ohio Public Service.

C. L. Harold, Brooklyn Edison Co.

A. C. McMicken, Portland Electric Power Co.

M. E. Skinner, New York Power & Light Co.

M. C. Huse, Philadelphia Electric Co.

A. K. Baylor, General Electric Co.

A. P. Good, Commonwealth Edison Company.

H. C. Thuerk, Associated Gas & Electric Co.

J. Daniels, Edison Electric Illuminating Co., of Boston.

J. L. Pollard, Pacific General & Electric Co.

F. D. Pembleton, Public Service Electric & Gas Co., of Newark.

V. M. F. Tallman, Charles H. Tenney & Company.

CHAIRMAN SAMPSELL: You have heard the report of the Nominating Committee. Do I hear a motion for its adoption?

[A motion was made and seconded.]

CHAIRMAN SAMPSELL: Are there any other names to be submitted from the floor as provided by the Constitution? If not, all in favor of the motion, properly seconded, will please say "aye." It is adopted.

I should like also to have a motion thanking Messrs. Swope, Insull, Groesbeck and Freeman, with their appropriate initials and titles, and also our President, for the words of advice and encouragement they have given us this afternoon, in order that we may have the lasting record of their interest in this Section's activities.

[A motion was made, seconded, and carried to thank the above-named gentlemen for their contributions to the Commercial Section.]

CHAIRMAN SAMPSELL: Unless there is objection, the meeting stands adjourned.

The meeting adjourned at 5:30 p.m.

ENGINEERING NATIONAL SECTION SESSION

ENGINEERING NATIONAL SECTION SESSION

TUESDAY, JUNE 4, 1929

[The meeting convened at 3 p. m. in the ballroom of the Atlantic City Auditorium and Convention Hall, Atlantic City, N. J., Mr. E. C. Stone, Chairman of the Section, presiding.]

CHAIRMAN STONE: I will ask the meeting to please come to order.

The first thing I have for you this afternoon is that we are honored by the presence of our President, Mr. Arkwright, and I am going to ask Mr. Arkwright if he will be good enough to say a few words to us. Mr. Arkwright! (Applause.)

PRESIDENT ARKWRIGHT: Having known Mr. Stone and watched his work, I will swear to whatever he says, because I know it will be true.

This is the first meeting of the Engineering Section that I have attended. I don't want you to think that is because of a lack of interest. Perhaps it is a shrinking due to the feeling that I don't know the business. When I first went into the electric light and power business it came as a very great surprise to me, and I said, "Why, no, I can't take the job; I don't know anything about the business." And the gentleman who owned the company said, "All right, you don't need to know anything about it; we will get a lot of engineers who do know about it, and they will run it for you." So it is that whatever we may say about the other branches of the business we all know that this business primarily rests upon the engineers. There is no question at all about it.

While I say I feel a lack of knowledge of the business because I haven't the engineering talent or engineering education or comprehension of what is necessary in so technical a business, I think the engineer maybe sometimes labors under the handicap of knowing too much about the business. I don't think that everybody should be a speaker. I really think sometimes that it gets to be a disease, this speaking stuff. I don't know that I care very much for the engineer orator, if that is all he is. Nevertheless it is also true that if you know a matter very thoroughly, are extremely familiar with it, you think everybody else ought to be familiar with it. Consequently, it isn't worth telling.

At times when I have wanted to talk about my own business down home I would naturally go to the engineer to find out something about it, and I would almost have to take a corkscrew to him to get it out, and when I did get it out I found something of intense general public interest, of the romance of the business that was useful to tell the public.

So I say that it is pretty bad not to know enough about the business, but sometimes maybe we suffer a little handicap from knowing too much about the business. Which brings me back to the statement that perhaps only applies to talking about it. Sometimes people who talk about things seem to get the impression that talking about them is doing them—no such thing. We can't get along in business except by the doing of the business, and for that we look primarily to the engineers. The advance in this business did not come from any other department, fundamentally, except the engineering. The type and the character of the business is such that always and forever the greatest advance in this business is going to come from the knowledge, the experience and the devotion of engineers who understand and work and plan.

Thank you so much for letting me talk to you. I wish to express my appreciation to you for your contributions, not only to the industry but your devotion to this Association and all its members through the work you have done in all the years, and especially in this one. Thank you very much. (Applause.)

CHAIRMAN STONE: In accordance with the Constitution, the Executive Committee of the Section has appointed a Nominating Committee, who will report at the close of this meeting and submit the nominations covering fifteen members of the Association, from which names the officers for next year will be selected. The Nominating Committee appointed consists of C. M. Allen, Chairman; Howard Cole, R. F. Danner, R. D. DeWolfe, and B. E. White.

Before proceeding with the rest of our program I will call upon one of our Past Chairmen of the Engineering Section, Mr. Moultrop, for a resolution which he has. Mr. Moultrop!

MR. I. E. MOULTROP: Mr. Chairman and Members of the Engineering Section, I want to speak of the sad loss that one of our old and valued members suffered a few days ago. I refer to the death of Mrs. A. D. Bailey, which occurred in Chicago through an automobile accident on Decoration Day.

Now this suggestion may be a little bit out of place, but in view of the fact that Mr. Bailey is one of our old members, almost one of the original members, a Past Chairman of the Prime Movers Committee, and the Vice-President of this Section, it seems to me it would be very appropriate at this time for this body to pass a resolution of sympathy to be sent to Mr. Bailey on the matter of his sad misfortune.

Mr. Chairman, I move you that that resolution be forwarded to Mr. Bailey, the exact wording to be prepared by some one who is gifted in saying the right thing in the right way.

[The motion was seconded, was put to a vote and carried.]

CHAIRMAN STONE: I am told that in London there are 38 different kinds of electric power for sale in different parts of the city. I am also told that the per capita use of electric power in London is something less than half of what it is in New York. I believe the two things go together largely, although, of course, there are other factors in the situation.

The standardization in the power industry that has gone on over the past years has certainly been one of the very important factors in bringing about the enormous development that has taken place, and I am therefore very glad to have on the program today a talk on the Practical and Economic Aspects of Standardization. The speaker is, I believe, the man in our National Electric Light Association who is best fitted to discuss this subject because of the fact that he has been associated with it from some of its earliest manifestations, and has very closely followed the developments in standardization, and has been a very important force in bringing about much of the useful standardization that our industry has accomplished.

I am very glad, therefore, to present to you Mr. L. L. Elden of the Edison Electric Illuminating Company of Boston. Mr. Elden! (Applause.)

PRACTICAL AND ECONOMIC ASPECTS OF STANDARDIZATION

By L. L. ELDEN
Technical Advisor, The Edison Electric Illuminating Company of Boston

Standardization is not new in industry, although the intensive efforts of recent years are indicative of new interest in this subject.

Competition for industrial and commercial supremacy has forced a new order of things, in that production and marketing methods have been developed on a scale hitherto unapproached in business life.

In most standardization work it is difficult to distinguish between simplification and standardization, yet in the end it is a combination of both, coupled with methods for eliminating waste, that prove to be fundamental factors underlying the success of most undertakings.

Many standards are temporary and subject to change to conform with progress in any art or industry. To accept as final any given development would be fatal to national progress. Research and invention will ever continue to develop new materials and processes, which in their commercial applications will displace many existing standards in favor of newer methods.

Under the present high pressure urge to extend standardization to include every possible activity, material progress is being made toward the desired end. Through the cooperative efforts of international and national organizations, societies, corporations and individuals, standardization is being continuously extended into new fields of endeavor, with results which must in the end favor the ultimate consumer.

Early Standards Utilized

Critics who for various reasons deplore the slow progress which is being made toward complete standardization appear to lose sight of past accomplishments, or the extent to which early standards are still utilized. The adoption of standard gages for railroads and vehicles were events of national importance in the light of later experience. Standardized steel products, now indispensable in all construction work, quickly revolutionized many processes upon their introduction, following the invention and development of modern methods of producing steel.

The old time lamp wick still enjoys extensive use in oil burning devices, as does the open flame gas burner in its respective field, where it has not been replaced by the more efficient mantle burner.

Bolts, nuts, screws, nails and tacks still retain the general appearance of their early days, although new manufacturing methods have refined and cheapened these products to a remarkable degree.

Writing materials, ink, paper, postage stamps, our national currency, and tables of weights and measures, all long since standardized, are continued in daily use without a thought of their status in the field of standards.

Governmental and other agencies have largely standardized almost everything that comprises the home, including the materials used in its construction, the clothing we wear, and the food we consume. Even the humble cow must provide milk conforming to prescribed standards, or she is taboo.

Examples of both existing and obsolete standards might be multiplied indefinitely without further effect other than to present more evidence of tangible results which have already been accomplished in work of this character.

Turning to the present we find in the telephone, our sister industry, the most highly standardized undertaking in the electric utility field anywhere in the world. This status has been reached by successive steps, only, as the result of intensive research and experimentation by a highly trained organization, without which the present day perfection of communication facilities could never have been attained.

Lack of standards during the first thirty years of the electric light industry was undoubtedly responsible for serious losses in many directions. This situation was but the natural outcome of independent development of systems and apparatus in a new industry.

The combination of numerous frequencies and voltages, direct and alternating currents, series and multiple systems, and overhead and underground distribution methods, were handicaps which would have destroyed almost any other new industry. In this case, the world-wide desire for better illumination provided the necessary incentive to continue development work in the hope of ultimate reward.

Minimum Number of Types

Most of these troubles are now behind us. The adoption of sixty cycles as a national standard, supplemented by twenty-five cycles for special applications, solved the frequency question and paved the way for the development of systems and standardized equipment on a scale even now unapproached elsewhere in the world. Concentration upon a minimum number of types of systems for generation, transmission and distribution, and the elimination of the many odd and special voltages utilized in early practice, have been contributing factors to present success.

With these fundamental factors established, progressive standardization has followed in other branches of the business, all designed to secure maximum operating efficiency.

For steam plants the designs and construction of boilers, piping, fittings, and associated equipment have been reduced to definite standards through the creation of standard specifications.

The designs of generators, converting and switching apparatus, and overhead and underground construction have also been more or less standardized at intervals in recent years, although such standards have been subject to frequent changes to keep pace with a rapidly changing industry.

Insistence on special designs and failure to adhere to the use of existing standard apparatus have materially retarded efforts toward standardization in many directions. In view of such success as has been attained in recent years it may be of interest to comment upon some outstanding examples of standardization which have been of major interest to utility interests and their customers.

Incandescent Lamps

The present day incandescent lamp is perhaps one of the best known examples of accomplishment through standardization. Progress in this work from the days of the carbon lamp has been reflected, insofar as public interest is concerned, in a steady improvement in efficiency accompanied by heavy reductions in selling prices.

Efficiencies of one-half to one watt for modern lamps may be compared with five and six watts or more per candle for early carbon lamps. Selling prices have been reduced 53 per cent since 1914, and 50 per cent since 1920. Two 40-watt lamps, for example, may now be purchased for the price of one in 1920.

Important factors in this accomplishment included the adoption of the Edison screw base as a national standard for lamps, sockets and fuses. A single standard base thus replaced twenty-six types of bases.

Standardization of lamp voltages within a range of 100 to 130 volts in 1914, reduced the number in common use from 20 to 5. Similar action in 1924 further reduced this number to three.

A new standard line of internally frosted lamps, comprising five or six units, introduced in 1925, replaced 45 individually different types of lamps then in general use.

Concentration of demand on a few types and sizes, the extensive use of automatic machinery, and the introduction of mass production methods have in this instance, as in many other lines of business, effected large reductions in the cost of the manufactured product.

Recording Wattmeters

Twenty-five years of intensive effort in the development of recording wattmeters have produced the present simplified and standardized product. This work has involved the closest cooperation between manufacturers and utility interests in order that meters might be produced which would be accepted as country wide standards for general use. This policy is in direct contrast with foreign practice where it has been customary for different countries and even individual companies to require meters of special designs. Under our national program, meters have become a thoroughly standardized product embodying many features contributing to substantial savings in all directions.

Interchangeability between the product of different manufacturers has been secured through the adoption of designs embodying uniform dimension and terminal chambers.

Marked improvement in the appearance and safety of modern meter installations, and appreciable reductions in installation labor costs, have been effected through the utilization of other standard materials including standard switches, cutouts, connectors, and last but not least, identified wiring.

Refinements in design have added materially to the speed and accuracy of calibration in the shop and field.

Meter performance has been so improved that a high degree of accuracy is maintained under overloads of three to four hundred per cent. Temperature compensation is so perfect that the effects of high and low ambient temperatures at meter locations may be disregarded. Meter overload capacities for short time loads have been substantially doubled.

Potential coil losses in the most used sizes of meters have been reduced from two and one-half watts to one watt. In a large system with 1,000,000 meters, such a reduction is equivalent to a reduction of 1500 kw. in the generating capacity required to energize the meters, and over 13,000,000 kw-hr. in the non-productive annual output of the system.

In the face of enormous development costs, the average selling price of a-c meters has been reduced from $11 to $9. On an annual production of 1,500,000 meters, the saving to purchasers of this single commodity reaches $3,000,000.

Transformers

Distribution transformers have undergone many drastic changes in design before reaching their present day perfection. To effect desired standardization and meet changing operating requirements, air-cooled transformers have been largely superseded by oil-cooled types, sheet steel has replaced cast iron cases in many sizes, special steels have been developed for core structures and many electrical and mechanical features introduced to improve transformer product as a whole.

New insulating materials have replaced inferior types, some of which were unsuited for use in conjunction with modern insulating oils. Electrical and operating characteristics have been steadily improved until standardization of performance characteristics and tap connections to conform with recently approved voltage standards appears to be all that is required to complete the standardization of this product.

Voltage standardization has been an important factor in transformer development through making possible substantial reductions in the number of sizes and types of transformers regularly manufactured. Through the joint action of N. E. L. A. and N. E. M. A. interests in 1924 in agreeing upon a schedule of standard voltages, a reduction of 50 per cent in the number and sizes of ratings was affected.

For this greatly improved product, selling prices have been steadily reduced to about 42 per cent of 1896 prices and are now only about 7 per cent higher than 1914 costs in the face of higher general costs now prevailing which exceed 1914 costs by 46 per cent for raw materials, 72 per cent for living costs, and 140 per cent for cost of transformer labor.

Motors

Motor standardization has long been required for economic reasons. Recent progress in this direction has fully justified the extended efforts which were required to secure general agreement upon satisfactory performance characteristics and rating methods controlling the design of the great bulk of motor production. Settlement of the long standing controversy between advocates of 40 degree versus 50 degree bases of rating, by the adoption of a single standard of 40 degrees plus a service factor, as the future basis of motor rating paved the way for general standardization.

Selling prices of motors now reflect in part the results of this work, for example, three one horsepower general purpose motors cost slightly less than one similar motor in 1902. Another example is the well known one-quarter horsepower washing machine motor costing $25.00 in 1921, which now sells for $9.50.

In this development nothing has been taken away, but on the contrary operating characteristics have been improved through improvement in efficiency and power factor, features of the utmost importance to both utility and consumer.

Manufacturers have recently concentrated their efforts upon a simplification program directed at standardization of motor parts and dimensions. In a single step one manufacturer reduced the number of bearing sleeves required for its product onehalf and in a final adjustment now requires but fourteen sizes for thousands of motor ratings.

All such developments make for volume production with favorable effect upon the entire product even though the output of certain individual units contributes little to the output as a whole.

Rating Standards

The rating of electrical machinery is one of the most important problems before the industry. Failure to adopt methods of rating which will insure the maximum possible output for a given investment results in an economic loss to all concerned. Temperature being for the most part the limiting factor in the performance of all electrical apparatus, standards have long been established, indicating the maximum temperature at which various types of insulation may be safely operated, as determined by standardized methods of temperature measurement. These standards while primarily designed to be utilized for test and guarantee purposes, have also been regularly employed to control the loading of apparatus in service to the disregard of existing temperature conditions favorable to securing greater output.

Under pressure of utility engineers, previously existing standards have been modified to provide supplementary ratings for apparatus under "service conditions." Recognition of this principle, as already applied to general purpose motors and transformers, permits an increase in the rating of these specific classes of apparatus, ranging from 15 per cent upward under prescribed temperature conditions.

The inclusion of "service ratings" in all rating standards based upon limiting temperatures, should engage the attention of all standard making interests, pending the time when rating standards based upon maximum temperatures may be properly substituted for prevailing methods.

Voltage Standards

The establishment of voltage standards has been of paramount importance to every branch of the electrical industry. Even the earlier indecisive efforts in this connection were important in their effect on lamp production and the development of appliances and much of the vast array of apparatus now in general use.

Concentrated efforts on this general problem have finally resulted in an agreement upon a new basis for voltage standardization which recognizes for the first time in the history of the industry the various steps in voltage regulation from power house to the consumer, which are necessarily encountered in actual practice.

These standards as now constructed are primarily based upon delivered voltages and, therefore, include specifications for primary and secondary transmission and distribution voltages with the necessary tap connections required under standard operating procedure. Under this program we may anticipate rapid concentration upon the use of not more than two lamp voltages under conditions which will react favorably upon the design and operation of a multitude of miscellaneous appliances and kindred apparatus.

International standardization of voltages appears impossible at the moment, largely due to long standing differences in national practices which now preclude wholesale changes in construction and operating procedure to secure international agreement on this question.

Miscellaneous Standards

Further examples of electrical standards which have been developed to overcome obvious defects in equipment and system operation, incident to the prevailing large scale development of the industry, would include many individual undertakings of this character.

Cable insulations have undergone complete revision, insulators for high tension service have been redesigned, switch performance and design have been improved, and insulating oils for transformers and switches have been reduced to a common standard which is approved for general use in a vast amount of equipment within prescribed voltage limits.

Various organizations working in special fields have created standards which have assumed national importance. Prominent in this field is the Board of Fire Underwriters whose work in developing standards for wiring and wiring equipment is well known to all.

To those who are familiar with efforts of this character it will be evident that such a list could be expanded indefinitely to cover actual accomplishments.

Standardization to be effective naturally requires the closest cooperation between affected interests and in this respect utility interests may be well satisfied with their participation in this work.

From the very nature of their position it has been necessary to evaluate the merits of almost every new piece of apparatus by actual trial on their respective systems. While their contributions have been large through personal effort, and absorption of the cost of development and experimental work in the cost of apparatus, it has only been through actual use under service conditions that the merit of most equipment has been demonstrated.

From this "cut and try" experience numerous constructive suggestions have been advanced by utility engineers and it has been their continuing spirit of cooperation and compromise that has led to the approval of those acceptable standards which are controlling factors in the advancement of the industry.

So far, attention has been directed to certain examples of standards which affect quality, performance, and finally the cost factors of products in their particular fields.

There remains a vast array of miscellaneous standards which deal with processes, dimensions, materials, and construction, or take the form of specifications, rules, regulations, and codes. Each has its appropriate application, but whether its existence is justified or not depends largely upon the economic advantages derived from its use. We may view many standards with unmixed satisfaction, knowing their effectiveness in application, while others less productive of good results may be appraised upon a less favorable basis.

In the matter of safety codes designed to reduce life and property hazards, no one will dispute the desirability of such guidance, yet the inclusion of mandatory provisions governing construction details may require excessive investment for outweighing any possible advantage secured through their use. Failure to control the personal equation has been a fatal weakness in most safety code standards.

On the other hand, regulations requiring standard coupling and breaking systems for railroads and uniform braking and gear shift controls for automobiles have been welcomed as a national asset promoting the safety of the general public.

In the preparation of standards designated as "Codes," the present tendency to resort to details or to prescribe specific construction methods detracts materially from their merits. Standards of this character should preferably contain no mandatory provisions and be limited to general recommendations if they would be of practical value. The administration of mandatory codes by local authorities inevitably leads to conflict and losses through inability to take advantage of improved methods not recognized in a prevailing code standard.

The advantages derived from simplification and elimination of waste in any undertaking should be too well known to require enumeration at this time.

The manufacture of munitions during the late war furnished an outstanding example of the adadvantages derived from simplified manufacturing processes in developing volume production.

Business Procedure and Processes

Standardization of business procedure and processes has not infrequently restored a failing business to prosperity. The success of the Pullman Company has been built upon standardized construction and service methods. In the automobile field the name of Ford has long been synonymous with efficiency and simplification in manufacturing and marketing processes. Waste materials early claimed his attention and in this phase of his operations he came to emulate Swift and Armour in their utilization of waste products.

Certain undertakings, for example, the gas, copper and oil industries, have found the development of marketable materials from otherwise waste products a practical means of increasing revenues.

Standards, to be useful, must be practical and capable of application. No standard should be created until its need is fully justified. Economies or other favorable developments should follow their adoption. Standards once established should be adhered to in practice, as long as they are useful.

The continued requirements for special apparatus often indicate failure on the part of many engineers to recognize the advantages of standard equipment.

Important manufacturers of electrical apparatus report that orders for specials constitute 50 per cent of their operations. A full realization of the costs involved, and injury to the interests of the purchasers, should lead to an early discontinuance of this practice.

Standardization must continue at all events if for no other reason than in self defense of our national institutions and personal welfare.

Foreign countries now engaged in rehabilitating their business interests through the prosecution of intensive standardization programs, will inevitably become formidable competitors in the future when the full benefits of their present efforts are fully reflected in the cost of their products.

With all that has been done in our own industry, many important projects require further study and possible standardization. Rating standards, switching apparatus, high tension insulator design and performance, lightning protective equipment, distribution systems and their allied devices, cable insulation, insulating oils, appliance performance, service regulations, and motor rules, are all projects warranting continuous efforts toward complete standardization.

The cost of prosecuting this work is high, involving the time and efforts of hundreds of individuals supplementing annual expenditures variously estimated at from $8,000,000 to $10,000,000.

Standards may be nothing to enthuse over, yet there is a considerable measure of satisfaction in viewing past accomplishments in the standardization field. It is apparent on every hand that this work has already contributed to the welfare of the ultimate consumer and the public at large in such a liberal measure as to warrant recommendations for continued support and prosecution of standardizing activities on behalf of the electrical industry.

I thank you. (Applause.)

CHAIRMAN STONE: One of the many results of the extremely rapid growth of power systems particularly since the war, has been the discovery of the necessity for planning ahead for future system development. One of the first companies to see this situation and to take advantage of the possibilities of it was the Detroit Edison Company, and I am therefore very glad to be able to present to you this afternoon the man who has fathered the handling of this subject and the development of systematic planning in the Detroit Edison Company ever since its inception some tyears ago.

Mr. A. C. Marshall will speak on the subject, "Shall We Grow Like Topsy or According to Plan?" Mr. Marshall! (Applause.)

SHALL WE GROW LIKE TOPSY OR ACCORDING TO PLAN?

By A. C. MARSHALL

Vice-President and General Manager, The Detroit Edison Company

American business today is a science, and the successful business man is a real scientist whether he knows it or not. A manufacturer asked a college professor how science could help business, and he replied, "Where would the suspender business be were it not for the law of gravitation?" (Laughter.)

The public utility business is a science, and the successful utility man is one who studies his business from the scientific viewpoint. In any such study there are two ratios that stick up like a sore thumb. The first is the investment per dollar of earnings, and the second is the operating ratio, or the ratio of direct operating expense to gross earnings.

While these two figures are vitally tied into the prosperity of a company, still they are independent figures. Changing one does not necessarily change the other, but conditions of solvency sometimes require that if one is changed, the other must be.

Consider for a moment the first figure, the total investment per dollar earned. In water power systems this will be higher than where steam generated power is used. But in such water power companies the operating ratio is low, so a return can be earned on a larger investment per dollar of earnings. In companies of which all or a large part of the output is generated by steam, the investment is about four to five dollars for every dollar of annual gross earnings.

My first point is that there are developments in the industry tending to increase this figure, in spite of rapidly growing earnings. Contrary to the opinion of some executives, I believe an increase is a very real possibility. There is an increasing amount of necessary expenditures especially in our larger cities that do not bring in a cent of additional earnings. Some of these are as follows:

A. Replacing poles and overhead wires with underground lines in greater and greater areas, not only in the congested downtown districts, but in more and more cases of rather important streets throughout the city.

B. Cost of better and more ornamental substation buildings to conform to high grade residential or commercial environments.

C. The increasing necessity for reliability of service requires expenditures continually for better equipment, more stand-by or reserve in lines and stations, and better relay protection. This greater reliability is necessitated by the development of new uses for power, such as the use of oil burners, refrigerators, and ranges in residence service; and increased use of power for heat treating and basic processes where an interruption will result in large loss, in addition to the mere loss of time and output. We can no longer look with toleration on even comparatively short interruptions in residential or industrial service.

D. The trend in all industry toward replacing man power with mechanical power is being felt in our own operations. In other industries this change results in great benefit to our business, as every such move requires a greater use of mechanical power which it is our business to furnish. In our own operations, while it may result in decreased operating expenses, it also increases the investment per dollar of earnings. This change is going on not only in outside plants, such as the development of automatic substations and water power plants, and automatic equipment like post hole diggers for maintenance work, but in other departments as well. Mechanical accounting devices are an illustration. Our accounting departments are beginning to look like fine machine shops, and the end is not yet.

E. The large capacity of our interconnected systems has increased the duty on circuit breakers and other equipment. This has required increasing expenditures for larger and better circuit breakers, the cost of which has risen following an alarmingly steep curve.

F. The lure of greater economy of generation is leading power plant designers to constantly strive after higher steam pressure and temperature and to incorporate more and more new and costly features. The result is that in spite of 150,000 kw. turbines, the total cost of power plants per kw. does not seem to be decreasing.

Two Classes of Expenditures

It will be noted that these expenditures fall into two classes. None of them contributes to earnings, but those in one group do result in lower operating expenses, while the others do not, or at least do so in a very indirect manner. These latter are contributions to civic improvements or to the requirements of a higher grade of service.

It is admitted that there are a few developments tending the other way. That is, toward getting increased earnings from the same investment. Residence service is promising. We certainly expect to increase materially the annual sale of kilowatt hours per residence customer. Here again, however, the electric range, one of the most promising sources of increased revenue, requires a considerable increase in investment to service it satisfactorily. The refrigerator and oil burner are almost pure gain, as they require very little, if any, additional equipment. But earnings, in dollars per residence customer will not increase as fast as the kw-hr. consumption. The kw-hr. sales will increase because of lower rates. As an extreme example, in one water power city the average annual use of all residence customers in 1928 was 3384 kw-hr. but the average rate was so low that the earnings per customer were less than $30 per year. This adjustment of rate or of rate form to increase residence consumption is good business, and we can well afford to do it, but it may not go very far toward reducing our investment per dollar of earnings.

So I still think that on the whole the developments tending to increase the investment per dollar of earnings are going to over-balance the contrary tendencies, and there is almost surely going to be a net increase in this figure during the next ten to twenty years. Those utilities now attempting to make forecasts for ten or more years confirm this opinion.

How to Offset the Increase

Assuming then for the sake of the discussion that the total investment per dollar of earnings is going to increase for some years to come, a serious question arises as to how this is to be offset. If we want to retain approximately our present return on total investment, there is just one remedy. That is, a reduction in the operating ratio. This is the ratio of direct operating expense to gross earnings; as usually used the operating figure includes taxes, but no appropriations to depreciation or retirement reserve. Expressed as one figure, it is the amount of every dollar of earnings that must go for this direct operating expense. It is usually lower for water power systems than for companies generating their power by steam. For the latter type of companies, the ratio will probably fall between 50 and 60 per cent.

There seems to be no way of getting around this fact that, if the investment per dollar of earnings increases, to earn the same return on the investment the operating ratio must fall. Like all ratios, this value can be altered by changing either term of the ratio. We can reduce the operation ratio either by reducing operating expense or by raising rates. You will remember the story of the sick darkey, as told by our old friends, the two Black Crows. He was advised by his doctor to eat chicken broth every day, and stay in nights, "and everybody knows you can't do that." That applies with equal truth to the matter of raising rates. "Everybody knows you can't do that." The only alternative is to reduce operating expense.

It is easy to figure the reduction necessary for a given increase in the investment per dollar of earnings. Consider an increase from four dollars to five dollars (which has occurred in the property of some companies in a comparatively few years). If, as an illustration, 13 per cent is required to cover return, fixed charges, except taxes, but including depreciation reserve, then an increase of one dollar in the investment per dollar earned means that out of every dollar of gross earnings there will be required 13 cents to cover the cost of this extra dollar, in addition to the 52 cents required to carry the original four dollars. This makes a total of 65 cents for fixed charges, leaving 35 cents for operating and taxes. "And everybody knows you can't do that." In other words, for every increase of one dollar in the investment per dollar of earnings, the operating ratio must drop 13 per cent to maintain the same rate of return unless rates are raised.

Decreasing Operating Rates

At the risk of tiresome repetition let me summarize. If there is going to be for some years to come a tendency to require more capital per dollar of earnings, and if we want to maintain or improve our present rate of return, a quite decided reduction in the operating ratio will be necessary. If an increase in rates is impossible, then the operating ratio can only be decreased by a decrease in operating expense; and to lower operating expense by an amount corresponding to or required by an increase of, say, one dollar in the investment per dollar of earnings, is almost impossible.

Now that is rather a long introduction to a rather short conclusion. That is nothing new; you all know that. It is only putting in unit figures for the sake of emphasis what we all know, and setting it forth here is to emphasize one effort that may be made which will improve the situation at both ends. That is, will tend to decrease our investment per dollar of earnings, and at the same time reduce operating expense. This is to get more and better system capacity per dollar of investment. One way to approach this is by better and more comprehensive system planning.

Most of our systems have "just growed" like Topsy. The result is they have been rebuilt time and again to meet the duties imposed by increased system capacity. The responsibility for this condition is not entirely on the engineers; in fact I am not attempting to place the responsibility. If the executives did not foresee the great growth of the industry it is no wonder the engineers did not do so. Also, equipment has not been available except as developed by the experience of living with these high voltage and large capacity systems. Some of our companies have rebuilt substations several times, each time putting in the very best available equipment, and each time seeing the whole thing scrapped in a short time because it failed to meet new duties.

Executives, engineers and manufacturers have all had a part in this lack of comprehensive system planning, but our present purpose is not to place responsibility, but to discuss remedies.

It is unnecessary to go into detail to show how costly this method of growth has been. Millions of dollars have been spent for transmission lines, circuit breakers, and substation equipment, that have proved inadequate and have been retired long before the end of a reasonable life. In spite of many drastic write-offs, plant account is certainly much greater than it would have been if it had been possible to develop a system plan years ago that would have provided indefinite expansion without going back and scrapping the beginnings.

As to the other term of the ratio, operating expense, this inadequacy of equipment has decidedly increased operating and maintenance expense, as these early and frequently recurring failures have caused abnormally high maintenance expense.

Orderly Development Desirable

Are we going to keep on growing like Topsy? If Eva typifies orderly and thoughtful development, as contrasted to the haphazard growth of Topsy, should we not emulate little Eva for a while? The time is surely ripe for definite system planning on a permanent basis, and this is up to the engineers as to the details of the plan and to the executives to visualize the problem. The past methods have worked fairly well in the sense that reasonably good service has been given, but they have proved expensive because of retirements from service long before the end of reasonable useful life.

Any system that does not provide for indefinite expansion without going back and tearing out the foundations, is all wrong. A master plan is necessary. This master plan should be flexible; it should be capable of adaptation to meet shifting conditions, and it should provide for almost indefinite expansion. Master plans which do not avoid inherent limitations to the growth of a system, such as the presence of excessive short-circuit currents, the lack of adequate quantities of condensing water, or streets choked with conduit runs, and so forth, are not suitable. There must be a prearranged solution to such foreseen difficulties, which are bound to arise as the system grows, and investment made in accordance with the plan should remain useful for a normal period of life. It should not be rendered obsolete in a few years because an unexpected growth has made necessary a complete rearrangement.

As a concrete illustration, assume that to serve a certain district a company has built a substation of 40,000 kw. capacity. The load grows rapidly until it is evident that very soon an additional twenty, thirty or forty thousand kw. will be needed, and it is not thought advisable to increase the capacity of that one substation. Is it too much to ask or unreasonable to assume that the system has been designed so that all that will be required is the construction of another substation of similar design to serve the increased load, and that it will not be necessary to rebuild the first substation as well as building the second; and that it will not be necessary to go back to a power plant and install new circuit breakers that cost many times the price of the discarded ones?

Once again I am saying that our business could have developed otherwise, but I am pleading for a start now toward a comprehensive system planning that will make for a different situation five years from now.

Distribution Development Slow

As to that part of the general system most susceptible to improvement, it would seem that distribution, in theory, practice and equipment, is far behind generating plant, transmission lines, lamps or meters. There has not only been slow development of distribution equipment that will operate satisfactorily on our present high voltage and large capacity systems, but there is an absolute lack of agreement among the engineers of large companies as to the best method of distribution for a large city, served by several power plants and many substations, through both overhead and underground lines.

It is no doubt inevitable that in the rapid development of a complicated industry, some parts of it will be perfected and standardized more quickly than others.

Budget control of both construction expenditures and operating expense is a great help to the executive and to the engineer in working out a comprehensive plan of system development. The budget provides a convenient and automatic method of a review by the executive of the engineers' plans and estimates. The engineer, if he avails himself of it, finds the budget a convenient means of coordinating his plans with past developments, and of judging the reasonableness of his proposed expenditures.

A good budget is the climax of the whole series of studies that begins with the consideration of the progress of the art of central station service and of changes in the habits and methods of living of the people who may be customers of the electric utility ten or twenty years from now, and that terminates in the project sheets for new items to be added to the construction program.

So we come back to the title of this discussion. It is largely up to the engineers as to the choice of our heroine. Is it to be Topsy or Eva? Thank you. (Applause).

CHAIRMAN STONE: The rapid growth of our systems has brought about other situations besides the necessity for planning, particularly a more difficult and a more complex problem in general for our engineers. It makes it necessary for greater demands to be made on the engineers. The engineer must come up to a higher, more rigid specification. The man who is going to discuss this subject has come up through the operating and engineering line. He has had experience broad and varied in operating problems and in engineering problems, so that what he will say is based not on theory but on continuous and extensive contact with the problems at hand and with the men who are doing them.

Mr. F. R. Phillips, Vice-President and General Manager of the Philadelphia Company, is in that capacity in charge of all of the electric, gas and street railway utilities in Pittsburgh. He has very recently been made President of the Duquesne Light Company, which is of course the Company in the group that is particularly interesting to us here. And I want to say also that Mr. Phillips is my boss, and he is a mighty fine boss. I take pleasure in presenting Mr. Frank Phillips, who will speak on Engineers and Engineers. Mr. Phillips! (Applause.)

ENGINEERS AND ENGINEERS

By FRANK PHILLIPS

Vice-President and General Manager, The Philadelphia Company, Pittsburgh, Pa.

It is with some embarrassment that I approach you at this particular time, for a number of reasons. One is the very generous and perhaps inspired introduction of the Chairman, and the other is that what little courage I had left when I came up on the platform a while ago has entirely disappeared since I walked into this box stall and I instinctively looked for the hay and the oats in the front. (Laughter). And then again, when I have to gaze through this barbed wire entanglement before me, it reminds me somewhat of an old gag of Artemus Ward in the days when one of our trunk line railroads was occupying the position that the Scotch now occupy.

You remember something to the effect of a discussion that he had with the conductor of a train, calling attention to the fact that there was no barrier of apparently seeming strength on the rear car of the train, and the conductor was surprised to think that any such thing was necessary.

Mr. Ward replied, "Why, what is to prevent a cow on the side of the road from coming right up into this car and biting somebody if you don't put the proper barriers before her?"

Perhaps these things before me are put here for the purpose of preventing somebody in the audience from coming up and biting the speaker.

The progress in the development of speech transmission has been all but miraculous, and I want to pay my little tribute to the engineers who have worked so assiduously, and to whom have come such great successes in the almost unbelievable progress in speech transmission, but I have this little suggestion to make. Perhaps it may have been thought of, and quite likely it has been. It would be much more comfortable for the speaker if the same improvement is made in the receiving apparatus, such as the microphone, as has been made in the transmission apparatus over our head. It would relieve the speaker and perhaps the audience, from some embarrassment. Certainly I believe that it will remove a detraction to the speaker on the part of the audience.

Somebody asked me to talk about engineers, and therefore the subject, "Engineers and Engineers." And before we talk about any subject, it is assumed that we find out something about it. The term "engineer" is rather an expansive one, and before I forget it I want to remind you that while I have a very carefully prepared speech on the inside of this envelope, what I am going to say is written on the outside, but for fear that somebody might break down the barbed wire entanglement and come up and bite me, I am going to use the paper for reference purposes.

I have no doubt that perhaps 90 per cent of the men, and perhaps some of the women—I am not so sure—before they arrive at the discretionary age of about ten years of age, have decided to be at least a locomotive engineer. And as time went on they became other kinds of engineers. In the construction of this building we have had all sorts of engineers, hoisting engineers, shovel engineers, stationary engineers, architectural engineers and others. I don't know whether they call the inside decorators engineers or not. And when I came down to Atlantic City I had the pleasure of following a locomotive engineer for about 450 miles. And then I think of all the other types of engineers.

So the question comes to me naturally, just what is an engineer? And I have come to the conclusion that we are all engineers. The latest type of engineers that you hear spoken of around the corners occasionally is the human engineer, the engineer of perhaps human psychology, which to my mind is more entrancing than any other type of engineer. Engineers are builders, and I believe anyone who is a builder, whether it be of concrete and steel and stone, or thought and ideas, is an engineer.

President Arkwright made some reference to his difficulties with engineers. I think it was a fair criticism of engineers. Engineers are full of ideas, and they owe it to the general public to tell about those ideas and tell them in an instructive, entertaining and effective way.

I was so entertained by Mr. Elden's paper about standardization and its tremendous effect upon the economic development of this country of ours, and then the story of Mr. Marshall about scientific planning—and on the side, let me say that we have quite an effective system development department under the very efficient leadership of your Chairman, Mr. Stone—those two subjects so engrossed me that I forgot what I was going to say myself about engineers.

Engineers Are Builders

But engineers are builders, and I fear sometimes that our engineering friends do not get the big broad picture of what it is all about. Why are we engineers? Why did we build this building? Why do we plan for the future of our electric systems? I was tremendously interested and charmed and encouraged by a remark that our President made during the political campaign of last fall. You will recall that in his various speeches he dwelt considerably upon the perfection of an economic system for this Government and this people, but he never failed to say that the very purpose of the development of an effective, economic system was the improvement of the home life of our country. In other words, we should bend our efforts toward the development of a great economic system for the purpose of banishing poverty from among us.

And that is where I fear that some of our engineering friends are losing sight of the goal. We build tremendously interesting, magnificent and far-reaching power systems or power stations for example. What is the function of a furnace and a boiler? Merely to generate steam? What is the function of a turbine? Merely to revolve a generator? And so on through the whole picture until we come to the consumer's place of business, or home. Is that the ultimate of our endeavor? I think not. I think, as Americans, as a progressive people, a people who seem to have been chosen especially to develop a plan of life or philosophy of life which will lead the world, that there is something more to our business than merely delivering kilowatt hours.

And that is the thought that I would like to leave with you, ladies and gentlemen; it is a far-reaching one and worth your careful and thoughtful consideration.

Engineering Defined

I will call your attention to a definition given by Mr. Henry G. Scott—all of you engineers know him—at his inaugural address, when he was made President of the American Institute of Electrical Engineers. This is his definition of engineering—Engineering is the art of organizing and directing men and of controlling the forces and materials of nature for the benefit of the human race.

I think he had the idea that I am trying to transmit to you. I think it is the ultimate goal that we should all look forward to, not only, as was so admirably displayed before you by Mr. Marshall, plan for the development of our power systems and our manufacturing systems, but for our social systems and for our political systems, to the end, as has been said so admirably by President Hoover, that poverty, suffering and sorrow, in so far as is humanly possible, will be banished from among us. Thank you. (Applause.)

CHAIRMAN STONE: If the usual parliamentary practice were to be observed, I presume that I should now call upon someone to take the chair while I read the Chairman's report on the work of the Section. Our meeting, after all, is informal, and for that reason I am simply going to read the report without going through the formality of having a temporary chairman.

REPORT ON ENGINEERING NATIONAL SECTION

By E. C. STONE, *Chairman*

"More System Capacity per Dollar of Investment" continues to be the principal objective of the Engineering National Section. The secondary objectives chosen as means of attaining the major objective include definite planning of system development, comprehensive engineering research, constructive cooperation in the standardization movement, and recruiting and training of adequate engineering personnel.

System Planning and Research

Further progress has been made along the lines of system planning and research through the creation last fall of the Power Systems Engineering Committee and the Special Engineering Research Committee. Both of these committees have already given good accounts of themselves, as will be noted from the record of their activities given below.

"More System Capacity per Dollar of Investment" is emphasized because of the increasingly important part that fixed charges are playing in the total cost of electric power service. With fuel efficiency at its present high level, the cost of generation has become almost a minor item, so that system investment now offers the greatest field of opportunity for further major economies. In the past, attention has been centered on reducing fuel and other operating costs. In the future it will be devoted particularly to economical system design and control of construction costs.

Major Purposes of the Section

For the information of those not closely associated with the Section's work, its major purposes are set forth as follows:

(a) To accelerate the development of the art through studies of important engineering problems and interchange of ideas between engineers.

(b) To keep the engineers of member companies thoroughly informed as to the latest and best developments and operating practices in power system engineering by providing opportunity for free discussion of their problems and by the compiling of serial reports on important engineering developments and practices for distribution to the engineers of the industry.

(c) To set up authoritative engineering policies for the industry in matters dealing with codes and standards, joint construction with other utilities and all other subjects in which engineering contact is had with other interests.

Serial Reports Cover Rapid Developments

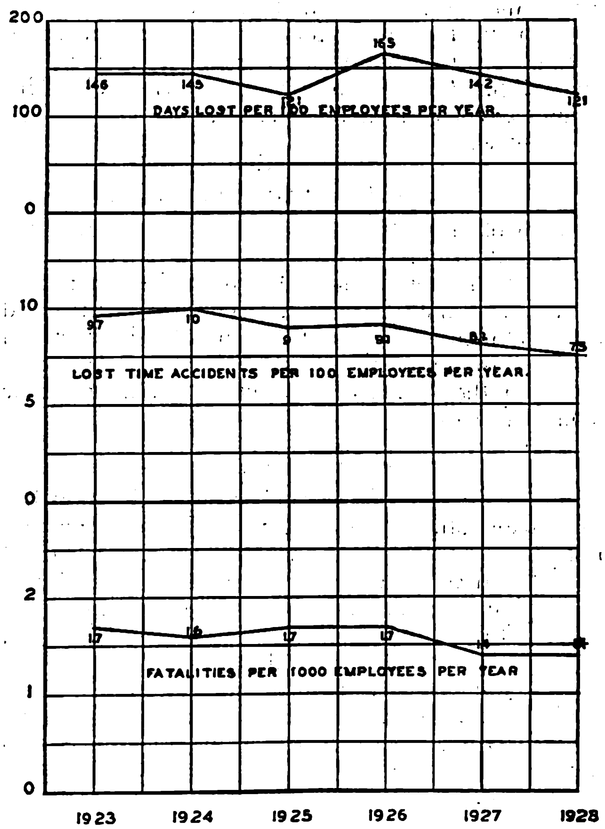
As usual, the work of the engineering committees during the past year has covered in a very comprehensive way the entire field of power system engineering. It is impossible in this brief report to record all of the interesting and valuable information developed from their studies and discussions. Rather, the purpose of this report is to present the present trend of power system engineering, to point out the subjects that are being given attention by the industry's leading engineers, and to suggest the lines along which engineers of member companies may direct their attention to best advantage. The complete story is told in detail in the serial reports that have been published during the year. Power system engineers can hardly be expected to keep abreast of the rapid developments in the art unless they are thoroughly conversant with the contents of these serial reports. All of them should be in the hands of and carefully studied by the engineers of every member company. The best way to be sure of getting these reports promptly as issued is to put in a standing order at N.E.L.A. Headquarters.

Engineering Administration Committee

The Engineering Administration Committee has continued during the past year to render an extremely important service in the administration of the work of the Engineering National Section. In addition to furnishing executive guidance in the many important subjects which have been placed before it during the year, the Committee has worked out with the N.E.M.A. a proposed standard patent clause to be incorporated in purchase contracts for electrical apparatus. This clause will be published in an early issue of the N. E. L. A. *Bulletin.*

Accident Prevention Committee

The Accident Prevention Committee has placed emphasis on two general lines of action. The first is the necessity of management's support for accident prevention work. Without continued interest and pressure from the very top, there will not be continued employee or supervisory interest. Both the credit for a good accident record and the blame for a poor one must be accepted by the chief executive. The second line of action is attention to engineering design. However well trained and managed the employee forces may be, human error and weakness will be experienced. There are many devices, guards, and other methods of proved efficacy in offsetting human error. This has probably been the least thoroughly cultivated means of prevention, and hence more careful attention to the safety features of engineering design are vigorously recommended. Emphasis on these matters is not intended to indicate any lessening of attention to the selection of employees or to their education in the proper attitude toward their work and the fostering of safety consciousness which always has been and always will be a necessary and effective means of prevention.



ELECTRIC LIGHT AND POWER INDUSTRY EMPLOYEES' LOST TIME ACCIDENT TREND

Compiled by Statistics Subcommittee, Accident Prevention Committee, N.E.L.A.

The accompanying statistics from the Accident Prevention Committee show a very satisfactory decrease in the rate of accidents in the industry.

Considerable public attention has recently been directed toward electrical hazards in the home. This is probably because, while such accidents are very few, they are necessarily spectacular in nature when they do occur. Recent statistics of the National Safety Council indicate that the chance of a fatal accident in the home from a fall is sixteen times that from electricity. Nevertheless, the Accident Prevention Committee has sensed the need for some sane recognition of this situation and prepared, with the cooperation and approval of the Commercial National Section and other interested parts of the Association, a safety in the home pamphlet under the title of "Common Sense." This pamphlet will be available shortly.

Resuscitation

The booklet on "Resuscitation," prepared last year jointly with other interested organizations, has had a circulation unprecedented for N. E. L. A. publications. Including reprints issued by insurance and manufacturing concerns, this circulation has reached into the millions. The work of the industry in educating the public in methods of resuscitation is having a very beneficial effect in building public good will.

Rubber Gloves

Intensive study of the rubber glove situation has been made during the past year. At the present time it is recommended that rubber gloves should not be used on lines where the voltage is in excess of 3000 to ground. For greater voltages high line tool work should be adopted. Improvements may, however, be expected in rubber glove manufacture, and it is hoped that a glove much stronger electrically and much more uniform in quality than gloves now available will be developed within a reasonable time.

Power Systems Engineering Committee

The scope of the Power Systems Engineering Committee includes consideration of all engineering and associated subjects involved in the development and design of the power system as a whole, including all steps from the forecasting of system loads to the financial statement justifying the necessary investment. The creation of this Committee provided for study and investigation of the now very important subjects of system planning and design, and intense interest has been shown in the work by engineers generally and by the Committee's own members in particular. Expression of this general interest is found in the fact that the Chairman of the Committee has by invitation presented talks on the work of his committee at engineering meetings of many of the geographic divisions.

Two fundamental objectives have been stressed this year. One is the development of a perspective whereby the utility system will be viewed as a complete assembly, requiring economic as well as engineering knowledge to develop. The other is promotion of the idea that system growth should be planned and that a planning department is a necessary function in the electric utility business.

Planning for system development starts with load studies and ends with a financial balance sheet. Engineering design of the system is thus only one element, although a very important one, in the complete problem. The master plan must reflect expected financial and economic as well as engineering and operating conditions. The Committee has found a very definite, well crystallized and uniform opinion among those executives who have developed planning organizations in their own companies that comprehensive future planning will bring about important savings in overall investment and operating cost.

System Stability and Lightning Protection

Two major problems of power system engineering, system stability and lightning protection, have received much attention during the past year. Increasing interest in these subjects is logical, in view of the constantly increasing importance and volume of the power companies' business.

Careful analysis of stability troubles by operating companies has thrown considerable light on the problem, but there is necessity for much further study. Instability may develop under conditions of normal system operation when the impedance of the transmission circuits is high in relation to the load involved, as in transmissions over very great distances or where relatively small line capacity is used to connect power plants for parallel operation. For improving stability in these situations, high speed excitation and power factor control are the most effective means. Instability may also occur under short circuit conditions in all systems. Under these conditions the means available for improving stability are the use of generators with high short circuit ratio, the maintaining in operation of proper relation between voltage, power factor and load on generators, and the introduction of reactance at strategic points in the system. In many cases generators must be operated at or below 90 per cent lagging power factor in order to obtain a safe margin of stability. High reactance is often placed at strategic points in the transmission system to limit to a portion of the system the disturbance and accompanying instability effect of a short circuit. Examples of this practice are found in the interposing of the high reactance of the distribution system between generator units (synchronizing at the load) and by the use of the so-called synchronizing bus in the power plants. If the governors of the prime movers do not shut down the units they control on short circuit and do not have normal periods of oscillation close to the period of the electrical system, they will not be a factor in system stability.

The only other means in sight at the present time for accomplishing major further improvement in system stability is quicker interruption of short circuits. It is therefore to be hoped that high speed circuit breakers and appropriate methods of selective relaying will be developed in the early future.

In lightning protection, the laboratory and field tests made by the manufacturers during the year have brought forth much enlightenment as to the true character of lightning discharges over transmission lines. Laboratory tests have developed more facts with respect to the breakdown voltage of insulation under lightning discharges. Manufacturers are in close agreement as to the ideal for lightning arrester performance and arresters are now built within reasonable approach to the ideal. The adoption of standard wave forms for comparative tests of lightning arresters and the development of standard test procedures will make it possible to buy this class of apparatus under logical specifications such as are available in connection with the purchase of other kinds of electrical apparatus.

Standby Capacity Problem

The problem of standby capacity needs careful study. The relation of installed capacity to load in all parts of the system should be based on accurate knowledge of operating conditions, and much more data are needed on the service availability of equipment and probabilities of simultaneous breakdown on different parts of the system.

Other basic system engineering problems requiring further study include control of plant frequency and of load distribution on the transmission system, voltage regulation, selective relaying and methods of grounding the system neutral.

Prime Movers Committee

The Prime Movers Committee reports that there has been no material change during the past year in steam pressures and temperatures. While several new plants or extensions are under way to be operated at 1400 lb., most of the new installations are for pressures of 400 to 500 lb. The pressure used in any case is mainly dependent on local conditions, including cost of fuel and operating load factor. The rise in steam temperature seems to have halted at about 750 deg. fahr., pending the development of new alloys for higher temperature service.

The size of individual boiler units has kept pace with the increase in size of turbo generators. Several boilers having a maximum capacity of 800,000 to 1,000,000 lb. of steam per hr. will be in service before the end of the year. Each of these boilers will be capable of serving upward of 80,000 kw. of turbine capacity. The almost universal use of water cooled furnaces, particularly in connection with pulverized fuel firing, has very largely decreased boiler outages. One large station so equipped has operated for the past eight months with a service demand availability of 100 per cent, thus indicating that power plants may yet be built with only one boiler per turbine.

The present limit of individual stoker capacity seems to be about 500,000 lb. of steam per hr. There is no indication, however, that the limit of capacity for pulverized fuel furnaces is in sight.

An extensive survey of the operating records of both single and two-pass condensers has been made. No decided advantage is shown for either type. On the average, heat transfers of about 80 per cent of the makers' guarantees are realized on both types under operating conditions.

Turbine Operating History

The operating history of large turbines has been brought up to date. A slightly improved record is shown, but the improvement is not sufficient to be significant. This operating history, which has now been kept for a number of years, is of particular importance because of the light it throws on the availability for service of installed generating capacity. Obviously accurate knowledge as to the expectancy of outage to generating machinery will permit of more accurate determination of the installed capacity necessary to serve given loads.

Hydraulic Power Committee

The Hydraulic Power Committee has given considerable attention to the problem of taking care of fish that pass up and down streams in which dams are located. This problem has assumed importance on the Pacific Coast streams particularly, and involves providing means both for assisting the large fish upstream over the dams and getting the small fry safely down on their way to the sea. Substantial progress has been made in cooperation with the United States Bureau of Fisheries. The electrical fish screen for directing the movements of fish and preventing their entry into regions where they are not wanted has proved quite successful. The next problem is the selection and improvement of a satisfactory form of lift or passageway for safely lifting the fish over dams and other high obstructions.

Recent disastrous failures of certain dams have caused the Committee to take up the study of such failures with a view of making recommendations that will result in safer practice in dam design and construction.

Further progress has been made in developing methods of forecasting water supply. While progress is slow, new ideas of a practical sort are constantly developing and are being broadcast by the Committee to interested operating companies. The problems of speed or frequency regulation and proper division of load between units in interconnected systems have brought about a need for better regulating equipment on hydroelectric generating units. Substantial progress has been made in crystallizing the requirements, from which it will be possible to develop necessary apparatus to adequately meet the situation.

Electrical Apparatus Committee

The Electrical Apparatus Committee has given much study to the apparatus problems associated with satisfactory operation of interconnected power systems. Further developments of interconnected operation have imposed the need for further study of the engineering problems associated therewith. In this connection, the necessity was brought out of basing interconnected operation of the systems of different companies on a form of business agreement sufficiently flexible so as not to arbitrarily force an operating scheme along uneconomic lines. One group of financially independent operating companies has interconnected its systems and pooled its power resources without a single word of written agreement. Satisfactory operation with substantial economies is reported.

The control of system frequency has become a major problem. Automatic systems of control are available, based both on indicated and integrated frequency. Further study and experience will be necessary, however, to determine the most desirable method, although it is reasonable to suppose that in the end automatic frequency control will be generally adopted. Phase control at strategic points in the transmission system is being found desirable in certain instances either for the purpose of distributing loads in accordance with line capacities, or in order to make possible the observance of contractual limitations in complicated interconnected networks.

This Committee definitely expressed itself in favor of operation of electrical apparatus on a temperature basis by approving the proposed operation standards of the A. I. E. E. for transformers as a suitable basis for securing experience on the effect of operation of transformers at ambient temperatures other than 40 deg. cent. for air and 25 deg. cent. for water. It is to be expected that standards for operation on a temperature basis will be developed for other types of electrical apparatus as rapidly as the necessary basic data can be obtained and agreed upon. This should result in a substantial increase in efficiency of use of electrical apparatus.

Insulating oil is a complex chemical compound which has been little understood. Recent studies, however, and observation of oil in service, have removed much of the mystery. New developments include preparation of a purchase specification by the Oil Subcommittee, adoption of the practice of reconditioning for future use of oils that have been used in transformers and circuit breakers, and further progress in interchangeability permitted by the manufacturers. Reconditioning plants generally employ the filter press for removal of sludge and sediment and a combination of centrifuge and filter press for elimination of carbon from circuit breaker oil. The cost of treatment varies from $15 to $50 per thousand gallons of oil. With certain limitations, insulating oil furnished by either the Westinghouse or General Electric Company may now be used interchangeably in circuit breakers and transformers manufactured by both companies.

Utilization Subcommittee Findings

In recognition of the probable engineering requirements in connection with the intensive load building effort that will be put forth in the next few years, the Utilization Subcommittee was created this year in the Electrical Apparatus Committee to deal with the problems involved in the utilization of electrical energy, including the engineering of present applications and the development of new uses. Following are some of the findings of this subcommittee:

Time delay under-voltage release devices, now available for the protection of motors, will prevent in most cases the shutting down of motors on drops in system voltage such as result from line short circuits. For this reason their use should be encouraged, and it is to be hoped that in due time they will generally replace the older and less effective instantaneous type of low voltage release.

Fractional horsepower motors having characteristics satisfactory for operation on lighting circuits, as specified in the agreement reached last year between the manufacturers and our representatives, should be available in the very early future to the manufacturers of electrical appliances without additional cost. It is of fundamental importance to the satisfactory performance of power systems that motors with these improved performances be generally used, and all member companies are accordingly urged to exert their influence toward the general adoption of such motors by appliance manufacturers. The adoption of appropriate motor rules by member companies will promote this desirable end.

Motor Starting Currents

Further attention was given to the matter of motor starting currents. It is recognized that starting current rules must be based on the combined cost of the motors themselves and the power system required to serve them, in order to give to the user the minimum overall cost of power. Furthermore, the size of a motor in proportion to the total load fed by one service has a major bearing on the problem. The starting current of a small motor in a large installation is of no importance to the power company, but if a motor is practically the total load on a service connection the starting current may necessitate an increase in the power company's facilities.

Other subjects dealt with include service voltage standards, wiring problems in connection with the National Code revision, effect of voltage variation on radio, operating characteristics of Neon signs, and installation rules.

Generator and Synchronous Motor Design

In generator and synchronous motor design there is a trend toward higher voltages and machines for 16,500 volts and 22,000 volts have been built. Two 22,000 volt generators have been in service in the humid climate of India since 1918. Double winding generators are being employed where large currents are to be carried, the advantages being reduction in short circuit kv-a. to one-half, additional synchronizing power, and reduction in cost. The use of hydrogen for cooling has been developed for synchronous condensers, and has the advantage of increasing the capacity of a given machine about 35 per cent. Investigation shows that the proportions of hydrogen and air which will cause an explosive mixture are such as to make explosion quite unlikely.

Marked progress is shown in the development of high duty circuit interrupting devices for operation without oil. The "Deion" circuit breaker offered by one of the manufacturers and successfully tested by a large operating company gives promise of great possibility. Development work has also gone forward on devices for interrupting the arc by gas blast, by the use of inert gas under high pressure, and by the use of the vacuum principle. The latter principle is reported to offer much promise. The Special Committee on System Testing of Oil Circuit Breakers continues in existence and stands ready to assist member companies in carrying out circuit breaker tests on their own systems.

The so-called metal clad switch gear in which switching equipment and auxiliary apparatus are all assembled in a single metal inclosed grounded unit is being found useful under certain circumstances by a number of companies. An installation of this sort may be made with the same compactness as an indoor installation and yet does not require a building.

Work of the Meter Committee

The Meter Committee has completed the correspondence course for electrical metermen and the greater part of it has been published by the Educational Committee. This course reflects the best practice in meter work, and is earnestly recommended for use by all electric utilities in connection with the adequate training of their metermen. Already a thousand copies have been sold.

By close coöperation with the manufacturers through which operating requirements have been made known, further advance has been made in the accuracy of watthour meters, particularly at overloads, in the development of polyphase watthour meters with bottom connected terminal chambers, in the accuracy and insulation of instrument transformers, and in the development of a 2½ ampere meter for use with instrument transformers which will result in measurements of greater accuracy.

The Committee keeps continually in touch with the service rules for meter operation in the various States. A report has been completed and published showing the similarities and dissimilarities in rules so far adopted. This work is with the definite objective in view of attaining uniform meter rules throughout the country. Various member companies have been supplied with information enabling them to prepare requests to regulatory bodies for the extension of periodic test intervals.

Outdoor Metering

Outdoor metering has received considerable attention. It is the opinion of the Committee that with the modern temperature compensated meters, outdoor metering is entirely practicable wherever local conditions may warrant. This method should prove useful in connection with rural line extension, summer resorts, and transiently occupied homes, places difficult of access, and in general in locations where climate and operating conditions make it feasible and economical.

The trend of modern meter installation practice provides metal inclosures for all service boxes and metering equipment between company mains and the load side of the meters. The advantages of metal inclosures have become generally recognized because they minimize accidental damage, make tampering more difficult, provide additional safety, and aid in standardizing meter installations.

Overhead Systems Committee

In the Overhead Systems Committee, the research work on the strength of overhead lines, together with the collection of information on loading which may be expected in various localities, continues to be probably the most important activity. The experimental line which was erected near Ann Arbor to study the effect of wind on aerial line structures has been subjected to a considerable number of wind storms throughout the past winter and a large amount of data have been secured which are now being analyzed. It seems quite likely that another winter season will give a sufficient number of winds of high velocity to collect all of the data necessary to determine the effects of wind upon wood pole structures.

A start was also made on a study of wind gusts. Special anemometers are being developed for the recording of wind velocities, and it is the intention to obtain simultaneous readings of velocities along vertical and horizontal fronts so as to obtain a more accurate idea of the way the wind acts. In connection with the wind gust study it is proposed to erect a 260-ft. steel tower on the same site as the experimental line for the purpose of obtaining the vertical variation in wind velocities.

The work of collecting information on storms involving both wind and ice loads has been carried on this year with much more satisfactory results than previously. The assistance of the Geographic Divisions in carrying on the collection of this information has been productive of very good results, and the cooperation of the Weather Bureau stations has been very helpful. A considerable mass of this storm data is now in the hands of Headquarters Staff, and if this can be carried on for several more years it should be possible to draw up some general conclusions which will be very valuable.

Subcommittee on Insulator Research

The Subcommittee on Insulator Research appointed this year to study deterioration of high voltage porcelain insulators has visited many of the insulator factories and has talked with those most closely connected with the research work that has already has been done on insulators. As a result of its investigations, it is recommending the initiation of a research project to study the behavior of high voltage suspension type insulators under conditions which would accelerate the deterioration of porcelain. Its purpose is to develop a better understanding of ageing in high voltage porcelain and a means of testing high voltage insulators to measure deterioration in its insulating value. At the present time it is only possible to determine if the insulator is totally unfit for service.

Subcommittee on Safety Codes

The Subcommittee on Safety Codes expects to start immediately on a Code of Principles which should govern the safe construction of overhead lines in all situations and which may be used as a basis for the next revision of the National Electrical Safety Code.

Other subjects studied include wire crossings over railroads, preservative treatment of wood poles, rural lines, highway lighting, methods of service restoration after interruption, and radio interference.

Inductive Coordination Committee

The Inductive Coordination Committee is made up of a group of representative engineers who form a very effective staff which is available for consultation by member companies in connection with coordination cases which may be troubling them. In this capacity the Committee dealt with nine cases during the year.

Recognizing the desirability of the engineers of member companies being better informed with reference to the fundamentals of inductive coordination, this Committee recommends the compilation and publication of an educational course covering the principles of inductive coordination. Because of the specialized character of the work, it will be necessary to have such a course compiled by an engineer especially assigned to the job, and the Committee accordingly recommends that provision be made in next year's budget of the Engineering National Section for the supplying at Headquarters of the necessary personnel to undertake the job.

Carrier current communication systems are being put into service in the transmission lines of power companies in a great many places. Little interest, however, is being shown in space radio so that the Federal Radio Commission has not felt justified in setting aside any frequency channels for the specific and undivided use of power companies.

Underground Systems Committee

The Underground Systems Committee reports improvement in the quality of cable as manufactured. The percentage of deficiency is lower, dielectric strength by short time puncture tests is somewhat higher, insulation resistance, power factor and ionization factor are distinctly improved. It is not yet possible to predict with certainty from the tests made during manufacture whether cable will give satisfactory service, but research investigations are under way to determine the nature of cable deterioration and to develop methods for indicating beforehand whether cable is going to be satisfactory in service.

It is obviously desirable to determine accurately the maximum loads that cables can be depended upon to safely carry. In this line, progress has been made toward the development of accepted methods of determining cable operating temperatures so that future tests and investigations by various operating companies can be compared upon a common basis and data presented to the industry that will make possible the maximum utilization of cable investment with resultant lower cost per kilowatt in the underground system. Much attention has been given to the measurement of earth temperatures in various parts of the country. Various methods have been developed and studies have been made of the relations between air and earth temperatures, the time lag which occurs between the two, and of the results which may be expected from the various elements influencing earth temperatures.

Reports for the year indicate a decided improvement in the operating performance of cables, joints and potheads, particularly in cables operating at 20 kv. and above. Over two-thirds of the cable failures are due to external causes and probably half of them could be overcome by greater care on the part of the operating companies. No failures occurred in oil filled cables. Single-conductor cable showed the lowest rate of failure from internal causes, followed by three-conductor shielded and three-conductor belted. Operating experience with alternating current low-voltage networks continued satisfactory. Most of the companies are using single-conductor cables on their secondary systems and depending on clearing secondary faults by burning off the cables. Experience so far indicates little difficulty in clearing faults in this manner where the mains are tied in solidly.

Arc proofing of cables in manholes has become accepted practice, and although there is no uniformity relative to material used, generally satisfactory results are reported.

Cable Insulation Research

Extensive research in cable insulation is being carried on both by manufacturers and operating companies, but there is still a great deal to be learned regarding the effects of entrained moisture, occluded air, nature of impregnating compounds and processes, use of special gases as inhibitives to ionization, nature of paper on cable in service.

One large company, after making a long series of tests on samples of paper insulated lead cables removed from service, has secured a portable equipment for making tests to determine the dielectric losses of cables in service for the purpose of getting information on effect of age on losses and rate of cable depreciation, and for developing a method of determining the safe loading capacities of cable runs.

Headquarters Engineering Staff

The Headquarters Engineering Staff, under the able direction of Major Bennion, is now very effectively organized, and although undoubtedly undermanned, has given an excellent account of itself during the past year. The engineers of the staff are at the same time the sentinels and ambassadors of the industry in engineering matters. On the one hand they keep in close contact with the activities of many other organizations whose work may affect our interests and promptly bring to the attention of the proper parties all matters on which action may be required. On the other hand they constitute an official point of contact with outside organizations and provide a channel for effective cooperation in engineering matters. Thus they not only protect the engineering interests of the power industry, but also make possible the cooperation of our industry with others in such a way as to bring about coordinated physical development and general good will.

During the past year an outstanding activity of the Headquarters Staff has been in connection with the working out of a satisfactory revision of the National Electrical Code. As is now well known, a vigorous attempt was made about a year ago to introduce into the wiring code certain requirements in connection with grounding which the power industry felt were undesirable at the present time, were too experimental to be standardized, and would in the end increase the complexity of interior wiring to the extent of seriously curtailing its normal development. The Headquarters Staff took this situation in hand, and through the machinery put in motion has now secured a satisfactory modification of the original proposals for grounding, which has been accepted by all interested parties. In this work the staff secured the creation of, and collaborated with, a Special Grounding Committee composed of commercial and engineering representatives appointed by the Association to participate in the Grounding Conference held last November by the National Fire Protection Association and a joint committee formed with the National Electrical Manufacturers Association to deal with wiring problems, and more particularly with the National Electrical Code.

Company Code Representatives Plan

In accordance with the recommendation of President Arkwright, company code representatives have been designated by many member companies to serve as channels for information to and from Headquarters direct to member companies. The arrangement throws a heavy task on Headquarters Staff to maintain this contact, but the records which are being built up as a result of this plan, and the solidarity which results from the closer contact is going a long way toward solving the code problem which has been confronting the industry in recent years.

In this connection the overhead line research of the Overhead Systems Committee already referred to, the collection of ice storm data from points all over the country, and the surveys now being made by an assistant engineer from N. E. L. A. Headquarters of old woodpole lines to determine their present conditions and record of performance, is a most valuable contribution, not only toward the establishment of sound code provisions, but toward fixing good practice.

Joint Development and Research Program

The joint development and research program with the Bell Telephone System has made further progress. The field investigation of the past two years at Terre Haute, Ind., which has covered extensive measurements on the toll lines from that city to Chicago covering circuit characteristics affecting noise-producing currents, will be concluded within a month. It is planned to follow this up with a brief test in North Carolina on an open-wire toll line employing decreased wire spacing and other features which will minimize susceptiveness of such telephone lines to the inductive influences of power supply lines. Among matters included in the Terre Haute investigation, upon which progress has been made, is a new method of test to determine the inductive effect of a power line on a telephone circuit which gives a much more accurate index than was had by the method previously used, and will serve to simplify the solution of future inductive coordination problems.

It should be noted that, while the Development and Research Project Committees are not in position to send out specific detailed reports, nevertheless the officials of member companies may obtain information with regard to the work by making specific request to the Headquarters Engineering Staff for such information.

In order to determine the magnitude of the noise-producing harmonics that accompany the fundamental 60-cycle power wave and are transmitted along the power circuits, a country-wide wave-shape survey has been conducted, covering many of the larger power systems in the country.

Telephone conversation is affected by room noise, as well as induced noise from power circuits. Apparatus has been developed for measuring and recording room noises, and a survey has been made of such noises covering a wide range of conditions under which the telephone is used.

A set of principles governing the physical relations between the power supply lines and the circuits of the Western Union Telegraph Company has been prepared and has just been printed for distribution to member companies. A subcommittee of the Overhead Systems Committee has developed with a similar committee of the American Railways Association a set of principles and practices governing crossings between power supply lines and railroads. This Committee will next proceed with the preparation of a set of specifications for such crossings.

The Headquarters Engineering Staff has also cooperated with Committees of the Commercial National Section in dealing with wiring problems, studies of oil burners and studies of the water heating problem. The Statistics Division is doing a most valuable work in assembling, analyzing, and distributing authentic vital statistics covering the operations of the industry.

Special Engineering Research Committee

The Special Engineering Research Committee, after making a comprehensive survey of the status of engineering research in the power industry, finds that there exists considerable duplication of effort, which is wasteful of time and money, although entirely unavoidable under the circumstances. The Committee, therefore, concludes that proper coordination of research work in the industry cannot be obtained unless a paid secretary is installed at Headquarters and provided with ample funds to defray traveling expenses. The duties of such a secretary, who would naturally be placed in the Headquarters Engineering Staff, should be to maintain a complete file on research projects of interest to member companies and to keep informed regarding their progress, to arrange for adequate publishing of information regarding results as rapidly as they can be made available, to arrange for the initiation, placing and financing of new and desirable research projects, and in general to do all that a staff member can do to coordinate and guide research work so that it will be of maximum use to member companies. The general situation in respect to engineering research in the industry is such as to make the adoption of this recommendation of primary importance. The Executive Committee of the Engineering National Section has approved it, and it is earnestly hoped that appropriate provision for carrying it out will be made in next year's budget of the Association. It is also recommended that the Special Engineering Research Committee be continued next year.

Standardization

An important step in standardization was made possible when the Executive Committee of the Engineering National Section approved the report of the Joint Committee of the N. E. M. A. and N. E. L. A. on preferred voltage ratings for alternating-current systems and equipment. This report has already been referred to by Mr. Elden. The adoption of the recommendations of this report generally by member companies will simplify the manufacturers' lines of apparatus, will bring about better adaptation of equipment to its service under prevailing conditions and will generally improve conditions for the interconnection of adjacent power systems. While the recommendations cannot be uniformly adopted at once, it is to be hoped that member companies will direct their system development toward the complete acceptance of the preferred voltage recommendations as soon as practicable.

Progress of Geographic Division Committees

The Engineering Committees of the various Geographic Divisions have made further progress during the past year in finding themselves, and their activities have been more extensive and more effective than heretofore. With the more definite understanding of their purpose and scope, the geographic organizations are being molded to specifically meet the local conditions. While the national organization is being used as a guide, each division is setting up only those committees in which it has a direct interest, while in some instances special committees have been organized to meet special conditions. This is as it should be. Such encouragement and advice as appeared useful has been given by the officers of the National Section to the Geographic Organization. The chief recommendation has been maximum simplicity of organization to meet clearly defined local requirements. In the working out of geographic engineering activities, a definite trend has been noted toward the conference form of meeting. That is, the various Engineering Committees of the respective divisions have met together once or twice a year for general conference and exchange of ideas. Definite programs have been prepared in advance, with carefully selected and well qualified speakers to cover the subjects set up for discussion. These programs have been advertised in advance. The result has been most gratifying, and indications are that this method of carrying on divisional work will be generally adopted. Very favorable comment must also be made of the valuable serial reports on timely engineering subjects which have been prepared by a number of the divisions. These reports form an important part of the work, but after all must be considered secondary to the major purpose of bringing together the engineers of the various companies for interchange of ideas and discussion of mutual problems.

Coordination of Associations' Activities

A very complete development of associations, particularly in the technical fields associated with the power industry, brings about an urgent need for coordination of activities. A cooperative arrangement developed recently between the Electrical Apparatus Committee of the N. E. L. A. and the Power Generation Committee of the A. I. E. E. sets a precedent which should be generally adopted.

Association organization is along two distinct lines. There are the trade organizations, of which the N. E. L. A. is a typical example, and the technical organizations, such as the A. I. E. E. In the latter class also belong such bodies as the National Safety Council. The trade association is interested in all lines of endeavor which are engaged in by the industry it represents. Its primary duty, however, is to handle for its industry as a whole such matters as cannot be effectively dealt with by individual companies, but many of these associations have added to this primary duty more or less extensive activities along the lines of training and educating the employees of the industry they represent.

The technical associations, such as the engineering societies, are also concerned with the education and technical development of their members, so that many overlaps develop from time to time between their work and similar work in the trade associations. Such overlaps often represent unnecessary duplication of effort and, therefore, waste of time and money. Coordination of the activities of associations, particularly those which affect the power industry, is of major importance at the present time.

One of the objectives of the Engineering National Section is constructive cooperation in the national movement for standardization. This subject has recently been of major interest to some of the Engineering Committees. Obviously standardization may be overdone; nevertheless, it is undoubtedly one of the major reasons for America's prosperity today.

It seems evident that standardization affecting the power industry up to the present time has been generally advantageous and has resulted both in economy of power production and in extension of power uses. There may, however, be a possibility in our present enthusiasm for standardization of allowing the pendulum to over-swing. The kind of standardization which established frequencies, utilization voltages, ratings of equipment, factors of safety of equipment has been a major factor in developing the use of electricity in this country. In the field of simplification, however, which results in a reduction in the capacities of equipment or qualities of material available, the immediate result is a less close adaptation of the available products to the service for which they are to be used. This fact alone means some economic loss. On the other hand, the results of simplification bring about economies, such as reduced costs of manufacture and reduction in stocks to be carried. It is thus necessary to balance the advantages and disadvantages of a given standardization project of this kind in order to determine its true economic value. The major purposes of standardization, to effect economies and extend use of product, must always be kept in mind in setting up this standardization program.

It is suggested that the Engineering National Section during the coming year give some attention to the subject of standardization, with a view to determining the lines along which standardization may be promoted to best advantage and wherein over-standardization with economic loss is a possibility.

"More System Capacity Per Dollar of Investment"

The vast amounts of money which are being expended every year in the generating and distributing systems of the power companies impose an ever-growing responsibility on its engineers. Broadly speaking, power systems engineers determine and specify how their company's money shall be spent. The exacting demands for the highest possible grade of service and the economic pressure to get the greatest possible value out of every dollar spent puts up to the engineer an even bigger job than he has had heretofore. The objective of the Engineering National Section of "More System Capacity per Dollar of Investment" tersely expresses the problem.

The years immediately to come will bring to the electric utilities a closer approach to saturation in available business and greater competition from other power sources than have heretofore been experienced. For this reason the power industry at the moment is particularly interested in commercial development. The engineer will play an important part in the new business program by indicating the character of load building that will most effectively use the system investment, and by furnishing costs of the various classes of service to be used as a guide in making rate structures.

Probably in no field of engineering are the requirements broader and more exacting than in power system engineering. Dr. Hirshfeld has said that the successful engineer in the power industry is a scientific business man. The job of the power system engineer starts with getting the solution to his physical problems, but by no means ends there. In addition to a thorough knowledge of the engineering principles involved and broad gage operating experience, successful power system engineers must also understand the business principles of the power industry and the major economic factors involved, must have analytical ability, good judgment, ability to sell their recommendations, and enough understanding of human nature to work successfully with those with whom they come in contact.

In many cases it will be necessary to broaden existing organizations if their engineering is to be done in such a way as to accomplish the most efficient use of the dollars spent for power system development. It will be necessary to set up places for those engineers who are to carry on the necessary development work. Mature judgment based on experience is necessary, as well as inherent ability to work out the problems involved. Hence provision must be made not only for the selection of engineers of the necessary ability, but also for their continuing service over a period of years, through recognition, by adequate step-by-step promotion, of their ability as it develops. Then there must be sufficiently attractive opportunity at the top to make it worth their while to stay in the game.

The Power System Engineer's Outlook

In the past the requirements of the rapidly expanding power industry for executives have diverted many, if not most, of the industry's best engineers into executive channels just at the time when, if they had remained engineers, they would have brought the biggest dividends to their companies. It is to be hoped that in the future it will be possible to retain in the engineering work more of the engineers who have shown unusual ability, in order that their judgment and experience may be applied to this problem of ever-growing importance, the most efficient possible use of the dollar spent in the power system.

For the power system engineer with the necessary qualifications and experience a most promising future is ahead, both in the strictly engineering field and in the broader field of management.

In closing, I wish to voice the appreciation of this Association for the continued interest in the generous contributions to the work of the Engineering National Section by all of its members during the past year. Without this, nothing could have been accomplished. I also wish to express my personal thanks as well as those of the Association to the chairmen of all of the Engineering Committees for their able leadership and untiring support of the Section's work, and to the Engineering Staff at Headquarters for the splendid cooperation given the Section at all times. Engineering Committees of the National Electric Light Association are doing a work and filling a place of such importance in the industry as to make certain their continued growth and prosperity. (Applause).

We have one more number, the report of the Nominating Committee, and in the absence of the Chairman I will ask Mr. Byron White, a member of the Committee, to please step forward and present the report. Mr. White!

Nominations

MR. BYRON E. WHITE (Utica Gas & Electric Co., Utica, N. Y.): In accordance with the provisions of the Constitution of the N. E. L. A., the Nominating Committee appointed by the Executive Committee of the Engineering National Section has selected the following fifteen names of members of the Association, from which President-elect of the Association may select the Chairman, Vice-Chairmen and Members-at-Large of the Engineering National Section for the administrative year beginning July 1, next:

A. D. Bailey, Commonwealth Edison Co., Chicago, Ill.
Thomas Sproule, Public Service Electric & Gas Co., Newark, N. J.
A. H. Kehoe, The United Electric Light & Power Co., New York, N. Y.
K. R. MacKinnon, Nebraska Power Co., Omaha, Neb.
W. E. Mitchell, Alabama Power Co., Birmingham, Ala.
F. E. Andrews, Public Service Co. of Northern Illinois, Chicago, Ill.
E. B. Ricketts, The New York Edison Co., New York, N. Y.
J. W. Sylvester, The Philadelphia Electric Co., Philadelphia, Pa.
R. L. Thomas, Pennsylvania Water & Power Co., Baltimore, Md.
Harold Cole, The Detroit Edison Co., Detroit, Mich.
L. L. Elden, Edison Electric Illuminating Co. of Boston, Boston, Mass.
E. E. Hill, The New York Edison Co., New York, N. Y.
N. E. Funk, The Philadelphia Electric Co., Philadelphia, Pa.
D. W. Roper, Commonwealth Edison Co., Chicago, Ill.
E. H. Collins, Washington Water Power Co., Spokane, Wash.

CHAIRMAN STONE: I will read a short paragraph from the Constitution:

> "The submission of names by the Nominating Committee shall not, however, debar any accredited representative of a Central Station Company Member (Class A) or a Manufacturer Company Member (Class D) from making nominations for any or all of the several offices to be filled. Such nominations, if seconded, shall be submitted for election at the same time and in the same manner as those of the Nominating Committee."

Does anyone wish to make any nominations from the floor? If not, then our session is finished, and I declare this meeting adjourned.

[The meeting adjourned at 5 p.m.]

PUBLIC RELATIONS NATIONAL SECTION SESSION

PUBLIC RELATIONS NATIONAL SECTION SESSION

THURSDAY, JUNE 6, 1929

[The meeting convened at 3 p.m. in the Grand Ballroom, Auditorium and Convention Hall, Atlantic City, N. J., Mr. J. F. Owens, Chairman, presiding.]

CHAIRMAN OWENS: I would very much appreciate if those who are sitting in the rear of the room and on the sides would occupy these front seats.

There is on the program this afternoon a space for remarks by the Chairman. In many respects I would if I said much, merely duplicate what I said the other day. Your interest, however, in our relationship with the public as evidenced by your presence here, perhaps warrants my making a few remarks as to the objectives of the Public Relations National Section, and the reason for such a section.

It was Alexander Pope who said, "The proper study of mankind is man"—a world of philosophy, a wealth of meaning in that short sentence.

It is another way of saying that everything in creation must be, if it is to be worth while, subservient to the interest of human beings. That is what creation is for. The Public Relations Section deals with our business in its human aspects and in its human relationships. It has for its objectives, securing of the cooperation of those whom we would serve on the theory that through that cooperation our service to them and they themselves, may be benefited.

It has for its ambition the creation not only of a material service, but a service that will be in a real and true sense, if I may use the term, a spiritual service—a service that has within itself a real contribution to the social order.

In the early days of our business we men were hard put to secure the capital necessary in launching a new and untried venture. Naturally, most of the best minds of the industry were given to the material side of the industry, or rather, may we say, to the application of the results of investigation, research and study in a practical way, to the furtherance of the industry.

Importance of Human Relations

Men began to realize, however, that the job when they furnished the material service is only half done, and as a means of introducing practical methods of developing that job to its full possibilities, they began to see that they were overlooking perhaps their best asset, that is, the men and women who had joined with them in this service. They began to see that if their service was to reach its full fruition, the men and women identified with them must be their real interpreters. They began to see that with the handicap of being a natural monopoly, they encountered a natural and latent, perhaps, resistance, or an aversion on the part of the public to forego their right of choosing where to bestow their favor. So out of that feeling grew an organization founded on the theory that human relations are certainly as important as the material aspects of our business.

It is very gratifying I am sure to you who have opportunity to come in contact with the men and women in this industry throughout the United States, to realize that that movement is bearing fruit. It makes little difference whether it is evidenced in the so-called public relations department, but rather it makes more difference that the evidence is found in the acts, the feelings, the consciousness of the men and women who constitute the industry, and in the reaction in the minds of the public.

It has been my experience in the contacts I have had—and I assure you they have been most pleasant during the past two years—to realize that by and large the operating companies in the United States have the confidence of the public whom they serve, and they have that confidence because they deserve it. They have that confidence again because they have surrounded themselves with unusual men and women, men and women capable of interpreting their industry to the public.

Industry Furnishes Leaders

It is rather an interesting thing to note that in almost every community, at least among the outstanding leaders of that community, are men and women of the electric light and power business. If a man is needed to head a Chamber of Commerce drive the chances are ten to one an electric light and power man will be chosen for that important job. If it is a president of a community fund that is needed in a city, an electric light and power man is chosen for that position. If it is a position of trust, a position that requires ability, an electric light and power man will always be among those considered for it. That in itself is evidence of the fact that the men and women of the industry have the confidence of their public. I think that is a real tribute to us and I believe that it will be a source of gratification to you.

Appointment of Nominating Committee

It is part of the routine of this meeting to appoint at this time a Nominating Committee which shall submit to the incoming President the names of fifteen men from whom shall be selected by him the Chairman of this Section, the Vice-Chairman, and the members-at-large for the coming year.

I would like to announce that Nominating Committee at this time:

Jackson Dick, Georgia Power Co., Atlanta, Ga.
Chas. Penrose, Day & Zimmermann, Inc., Philadelphia, Pa.
Guy Talbot, Pacific Power & Light Co., Portland, Ore.
A. W. Robertson, Westinghouse Elec. & Mfg. Co., New York, N. Y.
D. A. Elias, Harrisburg Light & Power Co., Harrisburg, Pa.

I am sure you would like to know the men and women who have done the work of this section during the past year. I have therefore asked to come to the platform the Vice-Chairman of this Section and the Chairmen of the various Committees. You know we have eight committees through which the work of the Public Relations National Section is done.

I would like you to know Mr. D. C. Green, Vice-Chairman. Will you stand up, Mr. Green? (Applause).

Mr. E. A. Barrows, Vice-Chairman! (Applause).

Mr. Leavitt L. Edgar, Vice-Chairman! (Applause).

Mr. McManus, Chairman of the Manufacturers' Advertising Committee! (Applause).

Mr. Vivian, Chairman of the Public Speaking Committee! (Applause).

Mr. Niesz, Chairman of the Industrial Relations Committee! (Applause).

Mr. Charles Jackson, Chairman of the Committee on Cooperation and Educational Institution! (Applause).

Mr. Clarence Law, New York, a member of the Executive Committee.

Some of the chairmen are a bit modest. They are not on the platform; therefore they cannot be introduced. If they come on the platform later I will introduce them.

I want to take the privilege of reserving to the last, but not the least, the Chairman of the Committee responsible for some very constructive work. I am going to play a little favoritism here by asking this Chairman to come on the platform, Miss Malicki. Now a woman's prerogative known from creation, is to talk. I am not going to let a single Chairman of any of these committees talk, but I know you want to hear from one of the greatest women in America. Miss Malicki. (Applause).

WHAT IS YOUR WOMEN'S COMMITTEE DOING?

By MISS SOPHIA MALICKI, *Chairman,*
Women's Committee

(For Committee Personnel, See Appendix 4)

The Women's Committee of your company should be able to do these things:

Correct any untruths or misunderstandings they meet either in their work or in social contacts outside of working hours.

Explain why a utility company differs in corporate structure and regulation from other companies women are dealing with.

Explain the rates domestic customers are paying—not the top rate to which most customers and our enemies are accustomed to refer, frequently not allowing for the discount—but the average rate that home owners pay over a month or a year. Many of our own people do not realize how low the average domestic rate is. Our women should tell to all they meet the constant reduction of electrical rates.

They should understand that cost of electricity is not the deterring influence to electrification of households; that they pay a negligible fraction of their household expenditures for all the uses of electricity in the home, not only lighting.

They should be able to tell all women they meet of your company's aim for the very best service at lowest cost.

They should have earned the recognition and respect of homemakers and their organizations in your community and they should be called on to cooperate in activities toward home and community betterment.

Representatives of homemakers should be coming into the meetings of your Women's Committee where they will come to know you better, your organization and your principles.

Your Women's Committee should be the recognized authority on household electrical equipment in your territories.

They should be telling homemakers through the home service department and the entire women's group, about electrical housekeeping and they should help to establish it in every home.

They should discover the little, and to us frequently insignificant, misunderstandings of homemakers with your service, which so often are the root of real mischief to best service.

They should be teaching resuscitation and first aid to women's groups and they should take their place in community safety activities.

In a word, they should, through their education and abilities, be intelligent representatives of your company on all occasions and in all places.

Not Theories But Facts

These are not theories; they are items of work actually being done in all sections of the country.

If your group is not doing these things, go over your committee program with your chairman. Give it a little of your and your executive's interest and counsel that the work may follow more closely your policies and your belief of what it should be.

There can be no industry with a more loyal woman personnel, one so eager to translate to the public its pride in the achievements of its industry and its responsibility in the social advance of this country.

If it is possible for one group to develop to a degree where its chief executive considers the Women's Committee one of the most important influences in building understanding between the company and the women of the community, it is possible for all committees whose executives have the same interest and have given the support which this executive did.

Homemakers are adopting the statement, "ask the light and power women." We cannot disappoint that expectation.

CHAIRMAN OWENS: So outstanding has been Miss Malicki's work that she has been invited to attend the conference in England, where I am certain she will contribute much to movements that are under way in that country in an attempt to put into effect the practical application of our industry to home-making. I am sure you will be glad to know that.

We are honored today by having with us one of the outstanding economists of the nation, a man who has always been sympathetic with our hopes to properly interpret our industry to the public, a man who has been very sympathetic with us in our attempts to keep the public thoroughly informed of our business. He has done more than assume a pacific attitude. His encouragement has taken a very definite and tangible form, and he has for a number of years offered a prize in a Public Relations Contest. I refer to Mr. B. C. Forbes of the Hearst Publications and Forbes Magazine, who will now announce the awards of the Forbes Magazine Public Relations Contest. Mr. Forbes! (Applause).

AWARD OF FORBES PUBLIC RELATIONS CUP

By B. C. FORBES,
Hearst Publications and Forbes Magazine

As I stand in this magnificent hall and on this very imposing platform, a rank outsider, I am reminded of a fellow countryman of mine who was going home late one evening, after having had rather a jolly time. As he was walking along toward his suburban home he happened to look into a ditch full of water at the roadside. He stopped, very much startled. He looked again, drew back, and looked around. He saw a policeman a little distance off.

"Officer, officer, come here!"

The policeman came up in a hurry.

"Officer, do you see anything down there?"

The officer looked and said, "No, there is nothing there but the moon."

He said, "*Is* that the moon? That is just what I suspected."

"Yes," said the officer, "that's the moon."

"Well," he said, "if that is the moon down there, what in thunder am I doing away up here?" (Laughter).

I am up here as a humble representative of the ordinary public, but I am up here for a very, very unusual purpose for a Scotsman, namely, to give away something. The only thing they say that a Scotsman ever gives away freely is advice.

We, the ordinary public, looking from the outside at the utilities industry in the last year or two, have been somewhat bewildered. Various people and interests have put in very energetic efforts to arouse our suspicions against you gentlemen of the utility industry. For a year or more now, almost daily, the Federal Trade Commission has been holding up to us a very uncomplimentary picture of you gentlemen.

Then, more recently a still more unfortunate incident occurred which has again tended to make us ask just what you men are after, just what you are doing, just what do you aspire to do toward the public.

Also, we have seen your stock prices go up very, very much faster than your rates have been coming down.

Also, we pick up the newspapers almost every day and read of this, that, and the next new gigantic consolidation. We read very recently that the greatest financial organization, the most powerful financial house in the whole world, had decided to become interested in your industry on a colossal scale, the usual American billion dollar scale.

We ask again, just what is the meaning of this, what prompts this?

Our Socialistic friends whisper in our ears, "Let them go ahead, let them go ahead and gobble up all the utilities of the country into two or three mammoth trusts, and then it will make it very easy for us to take them over."

Now, is that likely to happen? I for one think not.

I remember addressing the N. E. L. A. convention two or three years ago, and in the usual role of offering something that cost me nothing, advice, I counseled your industry, "Say it with lower rates." I was delighted to hear my friend, Matt Sloan, take up this theme at this convention and urge that course. I believe that, notwithstanding all the bad breaks—that is what I would call them—the utility industry has been having in the last year or two, everything will come out O.K. for you in the end, because I have the privilege of knowing personally many of your outstanding men in the industry, and I know their character, I know their caliber, and I know their motives.

Customer Ownership

As an offset to this breakneck concentration and integration which is going on, this corralling of the public utility companies scattered over the continent in a few hands, I believe that you are on the right track in bringing about an offset to the impression which that is creating on the public mind, namely, your efforts to develop tremendously widespread ownership of your securities.

It was your industry that was the first to inaugurate customer ownership of stocks. It is your industry that has proved far more successful in that very worthy movement than any other industry. That policy, I know, is going to continue. So that, while we are having and are going to have tremendous concentration on the one hand, we are going to have what I personally regard as the very best kind of public ownership on the other hand.

As I say, I think everything will come out all right after the present bewilderment, mystification, has had time to pass.

Earning Public Confidence

There is nothing, of course, more important for your industry than to earn the confidence and the good-will of the people. Realizing this, my own little organization has done what it could to encourage public utility companies to earn and deserve the confidence of their local communities.

It, therefore, gives me very, very great pleasure to present the Forbes Public Relations Cup, awarded to the company adjudged having conducted the most effective and most successful public relations activities during the last year, to Mr. Alton Leonard of the Puget Sound Light & Power Co., and I ask him to come up and receive this cup. The exhibit which won it, a very elaborate exhibit showing what the company did in detail during last year, can be found on display out in the exhibition hall. (Applause).

[Presentation of cup to Mr. Alton Leonard.]

MR. ALTON LEONARD (Puget Sound Light & Power Co., Puget Sound, Wash.): In accepting this splendid cup and the tribute which it carries, I wish to express to Mr. Forbes the appreciation which I know is felt by the entire industry for his splendid public-spirited and generous effort to annually remind us of our duty to the public. Over a period of many years Mr. Forbes, in his extensive writings for the press and through his splendid magazine, has devoted serious thought and careful consideration to the relationship between utilities and their public. He is recognized as one of the eminent authorities of the time on public utilities. So this annual award takes on deep significance and the winning of it becomes an honor indeed.

As I stated a year ago in accepting the Charles A. Coffin Award for the Puget Sound Power & Light Co., we have endeavored to build up within our organization men and women whose whole-hearted thought and purpose is to carry out the true intent and purpose of our industry—service to the public.

We have also tried to so conduct our business as to inspire within the public mind a confidence in both the financial and moral integrity of the company.

In the grateful acceptance of this cup I again pledge to you the continued efforts of the thousands of loyal employes of our company, who by their successful endeavors to carry out this policy have made the winning of this award possible. (Applause).

CHAIRMAN OWENS: Mr. Forbes has brought to us, as he puts it, the viewpoint of an outsider. He has brought us a picture, and I am sure it is a real picture of what the public is thinking and the questions that the public is asking. He has given us food for thought. He has outlined to us our job.

A man said to me the other day that there was no longer any need for a Public Relations National Section. He said, "I hope the time may soon come when there shall be no need. When material things assume a higher place in the scheme of life and in the general scheme of things than do the reactions of men and women and the interests of men and women change. Then we need not think very much about the question of public relations."

I said I hoped the time may soon come when we will not need a Public Relations National Section. I know the time will never come when any business that does not give first thought to the effect of that business on the lives of men and women can survive.

In the last analysis the question of consolidations, amalgamations and mergers will rest solely on the question of whether the results obtained through those consolidations are in the public interest, and we in our business, more than in any other business, must measure our acts by that test. Mr. Leonard, I congratulate you, sir, on having won this highly coveted prize, and you Mr. Forbes, have made us a real contribution.

One of the outstanding men of our industry who has always had at heart the public relations movement, and who was one of its first prime movers, is unable to be with us today, having been called to Europe. He has prepared what I am sure is a treat for you in the form of a paper. His paper will be read by Mr. Homer E. Niesz of Chicago, vice-president of the Commonwealth Edison Co. and Chairman of the Industrial Relations Committee of the Public Relations Section. Mr. Niesz! (Applause).

MR. H. E. NIESZ: I shall present Mr. Gilchrist's paper just as he has prepared it, and in a manner which I hope he would like to have you hear it.

SUPER HUMANS FOR SUPER INSTITUTIONS

By JOHN F. GILCHRIST

Vice-President, Commonwealth Edison Co., Chicago, Ill.

To the strong, intelligent, thinking young people of America; to the self-sacrificing men and women of high purpose and high attainment who constitute the faculties, and the officers and trustees responsible for the policies and properties of the great educational institutions of this country; and finally to the directors, officers and personnel of the companies, already great, producing and distributing electricity in this land, this address is respectfully directed.

Upon you rests the responsibility for the proper development of a great fundamental industry, possibly to become the greatest of all industries and the one to which more than to any other will the people of our country and the world be indebted for the greatest measure of human life and happiness—the industry whose product gives one man the producing power of scores of men of only a few generations past, that spreads the noonday light over the hours of darkness, that for a trifle provides the poor of today with relief from grinding labor and with comforts and conveniences, life lengtheners, which the money of the rich could not buy in the days of our grandparents.

What Electricity Has Become

I ask you in all modesty to stop a minute and consider what electricity and the electrical industry has already become in our lives only fifty years since the first practical discoveries were made and we first began to know this wonderful energy, more flexible than the hand of the maiden, more powerful than the arm of the giant, a superb and ideal servant which is already performing so manifold a service in the home, the mart and the factory, and which has already become the life spark of so many great industries, such as those making automobiles, airplanes and radios, which would fail and disappear without it, that we can hardly vision the chaos which would prevail if the electric industry were suddenly to be withdrawn.

The production and distribution of electricity is an industry engaging directly between three and four hundred thousands of our people, and as an initiator of the use of electricity it may be said to be responsible for the employment in all branches of the industry of over a million; an industry engaging ten billions of the savings of our people, and therefore more democratically owned and managed than any of our great industries, for its seven to ten millions of average citizen-owners far outstrip in numbers that other great group which owns the farms of the country; an industry which serves twenty millions of customers with an amount of energy equivalent to the works of thirty million horses laboring continuously twelve hours per day every day in the year.

One-half of this great development has taken place in the last ten years, forty years of previous growth doubled in ten, the result of a great and numerous people awakening to what electricity will do for them. And who will say that this rate of growth will not continue and even increase?

Naturally, this great and rapidly growing industry creates many demands on world resources, any one of which might be the subject of much discussion. I wish to discuss but one, the one which I believe is the greatest of all.

Looking to the future, the greatest need of this industry is for men and women, or might I say for superior men and women, superior in mental and physical vigor, superior in common sense, superior in general and special education, trained young people with an intimate knowledge of the present-day conditions in the business in which they expect to embark, so that on embarking there shall be the least time lost in finding themselves.

The period of physical vigor in the human being is so short that in occupations where experience added to other qualifications is a matter of so much importance, it is essential that no time should be lost in orienting the trained novitiate so that he may promptly assume the responsibilities of the position for which he has been trained.

Much thought is being given today to the question of what will be the limitation in size of our great commercial and industrial institutions, how much larger they can become, or, to put it in another way, as a recent speaker has said, "Are we building up something that will finally overwhelm us physically, mentally, sociologically and politically? Is this machinery of our life getting so complex and overpowering that the human machine is breaking down under it?"

What are the limitations of our modern institutions? And if growth is desirable from the standpoint of humanity's best interests, how can we extend these limitations? Will the human intellect, the human body, the vision, appreciations, determination, self-control of man be such that bigger men and women, better educated, better trained, will develop to take the bigger jobs? Or, to put it another way, must the jobs stop growing in size regardless of the advantages to the many because we have reached the absolute limit of human capacity?

To a certain extent we are facing this problem in our industry today. The big jobs are being filled, but no one appreciates more than the people that are in them, regardless of their capability, regardless of the fact that they are the best available, how much better fit they might be if they had had the benefit of special training for their present positions, or if they had known when they were young students, or if their instructors had known then as much as the occupants of these jobs now know of the requirements. Of course, that would be impossible and will continue to be at least until we can see much farther into the future than we can at present, but we now have a much better opportunity to judge of the requirements twenty-five years hence than the present executives had when they began, and much can be done to provide for the future if all concerned will cooperate and make the best use of the knowledge now available.

Always Room at the Top

If the student anxious to prepare himself for a useful and effective life, the educator devoting his education and culture to the turning out of a well-developed, well-educated and practical human product, and the executives in the electrical industry who are in a position to have the best vision of what is required, will work together on this problem, they certainly can accomplish much.

The old statement that there is always room at the top was never truer than it is today in commerce and industry. How often it occurs that the greatest difficulty is experienced in finding the persons to fill the vacancies left by death or retirement, and while this is conspicuous in the case of the heads of great institutions, it exists in just the same way in the case of the subheads, of whom there are a much greater number.

It is not at all uncommon in the present day for a large company to acquire a smaller one principally for the purpose of securing the services of the head of the smaller institution. And to illustrate in another way this dearth of supermen capable of filling the biggest of earth's jobs; we can recall many cases where some great property has been seen to thrive and make progress under one man only to retrograde under his successor. In such cases it is impossible to avoid the conclusion that when the able man died or retired, there was no one of equal or superior capacity coming along to take his place.

Such situations as I have referred to have not occurred frequently in the electric utility industry, but we are reaching a size, and the young men who have grown up with the industry and brought it to this point, are reaching a period of life where changes must occur, and therefore if we are to be alert and progressive and ready for the emergencies, it is important that we should give thought to meeting such situations in our business.

Here, as I have indicated, is a task and a situation in which foresight, proper education and training are most important factors, a situation which should be of the greatest interest to the young men and women of the nation looking for careers, to the educators of the nation who wish to serve by preparing young men and women for effective, useful lives, and to the owners, directors and executives of the utilities who wish to constantly improve the efficiency of their service to the public by having superior material to recruit and build up their organizations so that they will render the most complete service in the most satisfactory and economical way.

Look to Colleges for Trained Men

The very natural way to attack this problem is for the executives of the utilities to turn to the institutions of learning, universities and colleges, present their matter and ask for cooperation. There is little question in the minds of most people at this time that as a preparation for business a college education is very desirable, or, to put it another way, men and women of otherwise equal talents and ability are enough better prepared and consequently enough more effective in business positions if they have college educations than if they have not, to justify the expenditure of the time and money.

The utilities, therefore, naturally turn to the producers for their supply of college-bred men and women. In order that these young people may be particularly prepared for the work into which they are going and in order to stir up the interest on all sides, it is desirable to have a very general understanding of the character of the work into which the student is going so that he may fit in to the best possible advantage, and may avoid discouraging experiences and delays in finding himself and getting started. There is so much information which he will want and will have to have that he could so easily acquire along with his other studies and preparatory work, that I do not think anyone would question the desirability of such cooperation as I have discussed. Without much study it is difficult for the college professor or the layman to appreciate the possibility for the employment of trained men and women in the utility business due to the growing complexities requiring superior training, and also due to the rapid growth of the business and its potentialities generally.

Three Pertinent Questions

May we consider three questions which seem to be very pertinent to this discussion:

1. Why should the young college-bred men and women want to take up work in the electrical industry as their life work?
2. Why should the universities and educational institutions of the country take a great interest in the electrical industry, want to know the most possible about it, and want to educate young men and women in a way which will qualify them to do the best and most serviceable work in this industry?
3. Why should the electrical executive want to take into the employ of his company all the specially trained college-bred men and women he can possibly use, and to that end want a close intimacy with the faculties of the nation's higher schools?

Before answering these questions, let us give a little further consideration to the importance of the electric light and power industry and its probable future. Are we wrong—are we egotistical—in believing that our business is quite likely to become the greatest of all businesses?

All business is based on human needs and wants. If the human being sits still upon the earth he soon dies. If he gets up and becomes active—that is, exerts power and directs it intelligently—he provides himself with the necessities, the comforts and the luxuries of life and living, and the rapidity with which he accomplishes this and the extent to which he goes is primarily dependent upon the amount of physical power at his command.

Doctor Scott, President of Northwestern University, has shown in a most interesting way how a high standard of life for the few in past ages was dependent upon some power in excess of the physical power of the individual, generally supplied by slave power and animal power, and how in modern times the new electric power is becoming a substitute, and as a result even with present development of electric power there is an equivalent force equal in labor to the labor of many slaves already available to each citizen of our country, which is primarily responsible for present-day prosperity and the great improvement in the standard of living of our people. It would, therefore, seem that the want for power might become the greatest human want as methods for applying it are worked out and as these methods become known to the individual. Mr. Henry Ford is quoted as saying: "Power is the foundation of material prosperity," and also that, "This is the age of power." And one hears similar statements on every hand.

However, this does not necessarily mean that the power business will be the biggest business measured in dollars and cents of sales per annum, even though it may be fundamental.

Cost of Power Small Part

As indicated, the modern automobile, the airplane, the radio, are all dependent for existence as well as for operation on electricity. Without electricity we would not have them, and yet the cost of power required in the making of an automobile and the operation of it, even including the power required to produce, refine and transport the raw materials, may be only a small part of the price which you pay for the finished motor, so that while power is the dominant factor and controls all the wants, it probably is not the largest item, but even in this last thought we may not be looking sufficiently into the future.

Ten billions of capital is invested in the power business today, and the requirements of the people are making it necessary to invest a billion a year at the present time, and this rate of requirement is likely to accelerate, so that I should say it is most conservative to estimate that in twenty years, or at the time when the boys and girls coming out of the colleges today have reached their maximum value, there should be at least forty billions of capital invested in this business.

There is no question in my mind that this industry will shortly pass the railroad transportation business in capital invested and yearly earnings, even were it not almost certain that the operation of all parts of all the railroads by electricity purchased from the power industry is only a short distance ahead.

While it is speculation to attempt to look into the future, it seems reasonable to think that just as we have found ways of transmitting through the air sounds and signals which in the early part of the last century we could transmit only by wire (automobiles and aeroplanes have in an experimental way already been controlled and in that sense operated from remote points by wireless), so may the transmission of power by air follow the present distribution methods, opening up great fields for the increased use of power, which, with all the problems of control, distribution, sale and metering which would attend such a wonderful development, will afford fascinating occupation for large numbers of intelligent, trained people.

In short, there is no reason to think that for many years to come the rate of increase in the electrical requirements will not accelerate as compared with the period we have just gone through rather than decrease, and therefore, while I might go into great detail in speculating on what the development may be, I cannot but feel that we are justified in believing that this is a business which any able young person seeking a life work and an opportunity for service may place at the head of his list of possible occupations, and an industry which will have no difficulty forcing itself upon the active attention of those engaged in preparing the young men and women of our nation for the activities of life.

Returning to the questions propounded, the youth should desire to enter the electrical business because it gives him an opportunity for a vigorous, active life of service, which is the most worthwhile, in a large and important world's industry, perhaps destined to be the greatest of industries, at good remuneration, with an excellent opportunity to invest his savings advantageously, which is the most sure and honorable way of becoming independent. It brings him into an industry involving some of the biggest and most interesting problems that he will find in any modern world occupation, such as dealing with the human passions, jealousy, envy, personal ambition and greed in organization and overcoming these great obstacles to cooperative progress; and study of human nature and methods of dealing with it to bring out the best in those reactions which develop harmony, collective ambition and all the states of the human mind which result in accomplishment and high production; the art of building the organization where great men with no loss of spirit will work under other great men; intricate, absorbing questions of finance, administration, law and other fields and participation in a business where the opportunities for becoming well acquainted and becoming well known and useful citizens in the community are greater than in almost any other industry.

Interest in Power Industry

The institutions of learning should take a vigorous, personal interest in the electric power industry. First, from the general standpoint, it offers a great boon to humanity, and in order to know all these advantages and derive the greatest benefit from them, general education should involve a rather intimate acquaintance with the up-to-date electrical situation. Further, because of the industry's importance and extremely rapid growth, increasingly large numbers of people will become engaged in it each year, and there is not only a great opportunity of assisting the young people of the nation to get into most desirable occupations, an opportunity to render a great service to humanity by providing most practical education for young men and women who desire to go into this industry and are going into it in large numbers and who very shortly will be dominating its policies, but there is the greatest opportunity of having an important hand in molding the underlying principles and policies which will govern these utilities a few years hence. Thus responsibility for the public utility service of the future is now resting upon the shoulders of the educators of the country.

And lastly, the utility executive should welcome the advent of the college-bred men and women in his business, because it will raise the standard of his company's personnel and will put him in a position to render a better, more satisfactory and more economical service to his public. It will result in the application of brains, modern methods, research and high purpose to his industry, all of which follow in the wake of a well-selected and well-educated personnel. His business will develop scientifically and will grow more rapidly than it would possibly have an opportunity to do if served by mediocre and poorly trained people.

These are not new thoughts. What has already been done to develop such activities and the kind of cooperation we have been discussing? Some sixteen years ago the suggestion was made that relations should be developed between the electric public utilities and the great institutions of learning, and acting on this suggestion, a committee of this Association was formed, composed of professors from a number of the prominent universities and colleges and men prominent in the electric light and power industry. The reason for this desired relationship was that the electric industry was at that time growing at such a rate and furnishing a service of such great usefulness to the people that those engaged in it began to have some vision of what it was likely to become and to realize that not only should the institutions of learning be familiar with it and up-to-date with regard to it, from the standpoint of general useful information to the great body of their students, but that the industry was requiring more and more college-bred men to take up its work, and it was of the greatest importance that there should be closer relations between the educational institutions and the industry so that these young men would be prepared in a way to make them most useful in the industry, in the shortest possible time.

At that time the electrical manufacturing interests of the country had begun to pay considerable attention to the engineering graduates and the telephone interests also were watching the students through their courses and each was endeavoring to pick out the cream of the men.

Relations With Colleges

This activity on the part of the National Electric Light Association developed the fact that quite a number of electric light and power companies already had relations with their neighborhood colleges. The first work of this committee was directed toward accomplishing four things:

1. Assisting faculties, by consultation and suggestions, in the choice of studies for their curricula covering their electrical courses.
2. Working out plans by which more of the undergraduates could get summer work of a class which would be of some value to them from an educational standpoint and at a fair compensation.
3. Furnishing the libraries of the universities copies of worthy and valuable pamphlets and books bearing on the electrical industry.
4. Arranging for an interchange of lectures by electric light men before faculties and student bodies, and by members of the faculties before groups of utility employees.

This committee continued its work up to the outbreak of the World War. Then there was a cessation for a year or two, but after the war the committee was reorganized and has continued with growing interest up to the present time. There is a very excellent understanding on the part of the members of the committee of each other's situation. Through the medium of its various reports, a great many people in the utility industry are informed as to the work of the committee, but until about a year ago its work was not so well known among the educational institutions other than those that had representatives on the committee. Therefore it was deemed wise to have a representative of the committee who knew the work very well visit the more important educational institutions and familiarize them with what the committee was trying to accomplish.

Advantages of Close Relationship

The committee was most fortunate in being able to make an arrangement with Professor Ruggles, who at that time had just been called from the University of Ohio to Harvard University, and for that reason could arrange to give more time to this matter than would otherwise have been possible. This was a very happy arrangement, as it would not have been possible to secure the assistance of a man who had a better grasp of the subject, who was better able to present it, or who had as wide and as favorable an acquaintance among college people.

While the primary importance of this relationship between the educational centers of this country and the utilities is the securing of properly trained people for the utilities and the interchange of information which is essential to intelligent prosecution of that work, it is realized by the committee, and was by the original committee, that there are matters of general interest on each side which should be known to both parties, and to the utilities particularly it is of tremendous value to have the benefit of the unbiased views of these men of broadest attainment who make up the faculties of our schools. We have the great forum of the public, but it is not so tangible or accessible as this very logical forum of the leaders of the intelligentsia of the country, and there are many questions which come up in our industry, with regard to which we think we are pretty well informed and of which we believe we are taking a pretty broad view, in regard to which our views may be greatly broadened and our policies undoubtedly greatly improved by taking advantage of this natural contact.

Relations With Public

The range of these subjects is very wide, involving studies of relations between the utilities and the public, what should be and what is the attitude of the public toward the utilities and the utilities toward the public, what affects this attitude, studies of the relation between large numbers of the people working together cooperatively in one institution like a modern corporation, what conditions are conducive to the most effective work and results, financial questions, engineering questions, sociological questions, matters of research and investigation and almost innumerable questions and angles, all of which have a decided bearing on our business, and all of which should receive proper, organized attention in the well-managed institution.

The work of this committee should be receiving the very wide interest and support of the leaders of our industry. The farsighted ones, if not all of them, have begun to concern themselves with finding the well-balanced, healthy young people with superior intellects in their respective organizations and training them to fill the important executive positions in the future. Here is a branch of your Association's work which will be of great assistance in this task. I therefore commend it to you from the standpoint of your own interests, as well as from the standpoint of the general interest of the industry.

A Wholesome Opposition

I fully realize that this relationship between our industry and the educational institutions has been challenged as something improper by certain men in public life and a certain section of the public press, but if we are right in this matter, and I do not think any unbiased person who will take the trouble to learn the facts will think otherwise, this should not deter us. Furthermore, allowances should be made for the necessary time for information as to such activities to be digested by all branches of our body politic. Also, allowances should be made for the fact that, thanks to the sensation-loving proclivities of the average newspaper reader, some of these agencies have personal interests of a circulation character which are served by such attitudes and should not be taken too seriously. Such opposition is, on the whole, wholesome, and, despite the fact that many of the statements made by this opposition lack truth and most of the balance are grossly extravagant and misleading, they do tend to develop discussion and careful consideration, and will finally without doubt be found to contribute somewhat to the universally approved plan in the public interest which will ultimately be worked out.

Therefore, as all of the outcome of this situation and responsibilities will greatly affect the good of the nation and its people, we hope that this entire matter will receive serious, careful consideration, and that all working together we may, with interest and courage, proceed to work out a proper plan of procedure having in view the best interests of our country, our people and our prosperity. (Applause.)

CHAIRMAN OWENS: I am sure you will all agree that in this paper Mr. Gilchrist has made a very valuable contribution.

Our President has just come into the room. He is tired, I am sure. He has been a hard-working President. He has thrown himself into this job in the past year in a very vigorous way, and to be President of an Association such as this, widely scattered as are its members all over the United States is some job. However, I cannot let him get away without giving you a word of greeting. President Arkwright!

PRESIDENT ARKWRIGHT: The tiredness is not mine; the tiredness is that of the audiences to whom I have been speaking around and about. I do not need to come to a Public Relations Section to evidence my belief in it. I am stamped "Public Relations" all over. I told Mr. Owens I didn't think it was necessary for me to say anything to indicate the value that this Association and its officers, and I in particular, place upon the work of the Public Relations department.

I also say again I have almost got an obsession that these meetings should start on time, run along snappily, and adjourn shortly. I am sure I am not going to ruin yours by any speech of my own.

I would like to say, however, there was a time when they said the public utility had a "public be damned" attitude. Well, I do not think anybody ever made any such remark as that, but I do know that in our own industries, as in all public utilities, there was sort of a public indifference to the public attitude. It has completely changed. We are anxious to render such service in such spirit of co-operation—consideration of the other fellow's rights and viewpoints. I know very well that that change of attitude on our own part has been due in large measure to the activity of the Public Relations Section of this Association which has been spreading the need for that kindly treatment of the public and the customer, and stimulating a similar conduct on the part of our various members throughout the country. So if there is nothing else gained from it, or any other reason for the existence of it, the Public Relations Department justifies itself in the greater consideration, the better treatment, the more careful effort on our part to see that our acts are justified and done with consideration for the rights of others. If there were no other arguments in favor of it, that itself more than thoroughly justifies it.

Physical service alone does not, in our business particularly, answer the question. It is absolutely essential that we continue to conduct our publicity and our public relations activities.

Thank you. (Applause).

CHAIRMAN OWENS: Before announcing the next number, I want to call attention to a very special feature of this program this afternoon. In a very short time you will be privileged to hear one of the outstanding leaders in a movement that has for its purpose the assistance of home life, and its additional purpose, as I understand it, of encouraging men and women of every line of endeavor to give greater attention to the home and to the improvement of the conditions in the home. We have an authority on that in this program. You will admit, I am sure, that it is one of the finest things of this convention. We in this business are tremendously and vitally interested in learning from those who are authorities along this line. So after the next interlude, Miss Bane will talk, and I urge that no one leave.

There will be no Ripley lecture. I should announce we have substituted something else. The Western Electric Company who has always co-operated so splendidly with this convention, has given us something very interesting. I hope you will like it.

[Showing of talking-moving picture.]

CHAIRMAN OWENS: Before introducing Miss Bane, I should like to present to you Miss Eloise

Davison, Home Economics Director of the National Electric Light Association. (Applause).

I will now present to you Miss Lita Bane, Past President of the American Home Economics Association, and of the Home Economics Department of the University of Wisconsin, Madison, Wisconsin, who will discuss "The Part Electricity can Play in Better Home Management." Miss Bane!

THE PART ELECTRICITY CAN PLAY IN BETTER HOME MANAGEMENT

By Miss Lita Bane,

Past President, American Home Economics Association

It is something of an adventure, and perhaps rather a hazardous one at that, for a college teacher to address a group of so-called "hard-headed businessmen." Coming of pioneer stock where adventure was a part of everyday living, I have dared to take the risk.

Standardization, large scale production, and efficiency, have become words of such power that they have come to dominate most of our work and some of our play. However, even an efficiency engineer has been known to revolt when someone suggested that he apply efficiency principles in his own home.

Only last year one of our popular magazines carried an article which stated "For the man, Home is or ought to be the place to which he can escape from the more or less artificial postures of public life. It is where organization and efficiency should show their ugly faces as little as possible, where tidiness and system and the doctrine of a place for everything and everything in its place are abominations. Are we not sated with neatness and orderliness and schedules and filing systems in the office?" This will indicate to you how difficult is the problem of the home manager. Do we want standardized homes? Do we want efficient, standardized equipment? Do we want precisely standardized procedure? Do we want our every act controlled by standards of efficiency? If not, where should efficiency stop and inefficiency, so to speak, begin?

Proper Function of a Home

Some of the confusion regarding acceptable standards for home management arises out of the fact that we have no clearly defined, universally accepted definition of the proper function of a home in our present social order. Someone has well said that the chief function of the home is "to build men and women having noble minds and souls." While that is a perfectly legitimate purpose, what are the factors to be considered in so administering the home that it shall best discharge this function?

In some ways our attitude toward our homes resembles our attitude toward recreation. It is the process rather than any measurable accomplishment that we enjoy. Take the game of golf. There are many more efficiency ways of getting a ball around over a pasture, dropping it in holes and extracting again and going on, than by knocking it about with a queerly shaped stick. You might carry it around in a basket, or in your pocket, dropping it carefully into the holes as you come to them. It is this point of view regarding home-making that is sometimes missed by the person of little imagination, the person who insists that every woman should hail with delight any piece of equipment that offers a shortcut.

I have purposely begun at this point not because I believe that homes should be inefficient, but because I am so thoroughly of the belief that they should be efficient in accomplishing their objectives, which are in the main quite different from the objectives of a factory or perhaps industry in general.

We all know, however, that no matter how much "play" may enter into the doing of some of the housework, there is much of it that most women are glad to delegate to machinery. While a woman may delight in mixing and baking the special kind of cookies her family likes best, she would without doubt welcome any machine that would relieve her of dishwashing. In fact, it seems safe to make the general statement that women are glad to routinize, standardize, and mechanize any frequently recurring tasks whose processes no longer hold any interest for her.

Electricity is one of the home manager's valued allies. It is our aim to help her make it more adequately serve her needs, not forgetting that she will always look upon it as a means to an end, that end being in most instances a fairly intangible one, falling more in the realm of the spiritual than of the physical. Nevertheless, physical needs are ever present and insistent, and the home-maker can often use machinery to shorten her time of work and lessen the manual labor involved.

Technical Processes Improved

The home of today finds itself in a rapidly changing world, a world in which technical processes have been enormously improved both in the house and in the world outside. We are indebted to Dr. Ogburn of the University of Chicago, for collecting figures which indicate the way in which housekeeping practices are changing. The number of servants is decreasing. The number of waiters in restaurants, the number of delicatessen shops, and of bakeries, is increasing rapidly. The use of canned foods is increasing. Families are increasing the number of their washings sent to public laundries. The number of sewing machines in use in homes is decreasing relatively. The relative number of apartment type dwellings is increasing. These figures indicate that women are delegating to outside workshops an increasingly large amount of work formerly done in the home. Electricity can thus indirectly benefit the home manager by further perfecting factory processes. Notwithstanding these rather startling figures, it seems likely that for many years to come there will be much manual labor for a woman or for a machine to perform in most households.

The home manager's responsibility is to so manage the time, energy, money, and abilities at her disposal as to make the home yield to all members of the family the greatest possible amount of satisfaction. Electricity can aid her in several ways. (Power) By furnishing power to drive some of the machinery. On this point a few comments are perhaps in order. Some family budgets are entirely inadequate to finance the buying and operating of power driven machinery. When the mother of the family is well and strong, it may be the best kind of thrift for her to save money by using her own strength to do the manual work of the household. Many women prefer to do this in order to have money for some other items in the budget which they believe will make a larger contribution to the welfare of the family. It is a mistake for her to be persuaded to buy power driven machinery. On the other hand, for the frail woman, or for the ample budget, it is highly desirable and usually proves to be less expensive than servants.

I had an interesting personal experience only two weeks ago. A student reported the following: "My father happened to bring home a Kitchen Aid. He had learned a little about how to operate it, and he tried to teach my mother. She used it a few times. We have a maid of all work. She does some cooking, serving, and general things about the house. Mother tried to teach her the little she knew about it, and the maid said it was more work than it was worth."

A Practical Helper

I pointed out to her a woman whom I knew very well, who lived in a suburb, did considerable entertaining, is not strong physically, and finds it difficult to get any part-time help, who has made very good use of her Kitchen Aid. On inquiring what was one of the things that enabled her to do the large amount of entertaining that she does do, she replied it was very largely due to the fact that she had this particular piece of equipment.

So you see the equipment has to be selected to meet the needs of the particular household. However, one of the most important things it seems to me is to have someone teach the women how to use each piece of equipment efficiently. In the first place, father had bought the machine, learned a little about it, but he didn't know much about cooking in the first place. He in turn tried to teach what he had learned to his wife. She in turn tried to teach it to the maid. There was too little information, and the tool seemed to be useless in that household, while if the person who was to use the tool had been taught just how to use it, it might have been a labor-saving device even in this household.

One way to make the costly equipment available to families of low income is to own it cooperatively. You occasionally find an apartment house where tenants own a washing machine, vacuum cleaner, and other equipment cooperatively. There is still a large field for encouraging people who have limited incomes to pool their resources and purchase one or more expensive pieces of equipment and pass them around for use.

One of the things that we always have to meet in trying to persuade women to use machinery is the fact that they do not know much about machinery, and feel much as they do about mathematics when they say that they cannot "fiddle with figures." They often do not have any confidence in their ability to run a machine.

Many women doubt their ability to master the techniques involved in operating even the simplest machinery, though I believe the automobile has been effective in reducing the number of doubting ones, since so many women are now driving cars. Women have reported that men are not so effective as are women in persuading them that they can use motor-driven equipment. Neither do men seem to be so successful in teaching them how to operate and care for their machines once they have bought them. As we all know, cooking with electricity involves a technique differing in many respects from that used in cooking with gas, coal, or wood. Someone who can teach women this technique with patience and thoroughness is a real asset to any electrical company. Many women who have reported dissatisfaction with other electrical devices find them invaluable after having been taught how to use them.

So Many "Contraptions"

In reply to the question, "What shall I say to the National Electric Light Association?" put to a woman who is an ardent advocate of electrical devices, I received the reply, "Tell them not to try to get people to use so many 'contraptions.' " To my inquiry as to what she meant by "contraptions," she mentioned several complicated pieces of equipment devised to perform tasks which in such a small unit as the home could be done more efficiently by hand or by a simple hand-operated machine. There again it seems to me that women who actually do household work, know what should be done in the household, and should be useful in advising regarding equipment.

While there may be a limited demand for specialties of some kinds, women seem to agree that they would like to see the major efforts directed to devising power machinery to take care of the time-consuming, heavy, frequently recurring, likely-to-be-monotonous tasks. For example, an electrical device for making beds would not be likely to meet with much enthusiasm in most homes, whereas witness the enthusiastic reception given to electrically operated cleaning devices, and to some electrically operated cooking devices. Bed-making is not a particularly heavy task. It has to be done only once a day and requires comparatively little time. Consequently this process and kindred processes can well be performed without the aid of power-driven machinery, for the present at least.

Freedom from Manual Tasks

It seems worth while to note in passing that with the advent of more freedom from manual tasks in the home, women will have a better opportunity to devote themselves to the care and training of their children, to making the home the place of rest and satisfaction that we all want it to be, and to participation in worth while community activities. It seems likely also that the home may regain some of its former prestige as a center of recreation for the family and small groups of friends. Electricity is making a direct contribution to this situation through the radio and electrically operated musical instruments, and indirectly by making the house more comfortable and convenient for the entertainment of guests. It will undoubtedly make even larger contributions in the future.

Had I the mind of an inventor, I could doubtless suggest many needed devices that some of you would go home and straightway produce and have on the market tomorrow. My secret ambition at present regarding tools seems to be to invent some kind of electrically driven can opener that would be cheap and effective. Someone has suggested that cans should be equipped with zippers, and I am sure I approve the suggestion. If you follow out the various tasks the woman has to perform, you will find there is no more awkward task than this one being performed by a tool which is as yet far from perfection.

(Heat) There is considerable division of opinion regarding the electric stove. Unquestionably where gas is not available, an electric stove is a real boon. Some of us have not yet been persuaded that an electric stove is just as much a convenient, all-around stove as a gas stove. I see no reason why it should not be made so, and I think in a great many instances the difficulty lies in the fact that we have not yet learned how to expertly use an electric stove.

Because it is clean and is fairly easily controlled, it will probably serve as a satisfactory source of heat if the price of equipment and current are sufficiently reduced to make it practical for the lean purse.

Electricity as Source of Light

We are so familiar with electricity as a source of light that I scarcely need mention it more than to congratulate the makers of light bulbs and fixtures upon the progress they have made both from a practical and aesthetic point of view. My friend referred to previously, suggested that I urge you to devise some inexpensive method for using indirect lighting in private houses, particularly in living rooms. Having spent my childhood days where lamp chimneys had to be washed, and that being assigned to me as my particular chore, I bow my thanks to the electrical world for changing our method of lighting. My only comment here would be let the good work go on.

It was my assumption that you wanted someone representing a group of people who are making a careful study of the home-makers' needs, to pass on to you any suggestions that we may have. Therefore, acknowledging our indebtedness to you and assuring you of our eagerness to cooperate in making housekeeping less arduous and more interesting, may I suggest that efforts be made as follows:

1. To produce and sell electrical current as cheaply as possible. In my contacts with women in their own homes, I often mention electricity and ask them why they do not use electrical equipment. The answer invariably is "it is too expensive." Perhaps there is nothing that can be done about it, but we hope there is. I grant you that some of this is prejudice. We have so long thought of electricity as being expensive that there are a good many women who automatically say it is too costly, without having the facts. Those facts we want to get from you, and we in the home economics profession are glad to pass on any information that will help to correct prejudices that may have been carried over from previous years when electricity was more expensive.

As you know, reports indicate that only slightly more than half of our population live in electrically lighted houses. There are other figures that indicate that a relatively small proportion of our houses have vacuum cleaners, refrigerators, and electric washing machines. More of them have electric irons, but we still have a great deal of room for expansion.

2. My second suggestion is that you make a careful study of the needs of home managers in order that money and effort may not be wasted in producing tools that are used very little, or are useless.

You know, I am sure, that you can quickly build up a prejudice if you equip a house with pieces of equipment that do not meet the needs of the particular household. Immediately there is set up a wall of prejudice which is difficult to break down. It seems to me that all of us need to study the needs of the home manager in order that we shall put into her hands only the tools that are really efficient for her.

3. May I suggest also that an attempt be made to produce electrically driven machinery which shall be as simple and as cheap as it is possible to make it, consistent with good service. Is it not possible for some plan to be put into operation whereby only safe, durable, and efficient machinery will be offered for sale? Make it fool-proof so that the woman who is buying cannot make a mistake, that whatever piece of equipment she shall buy shall meet the requirements of safety, durability, and efficiency.

Would it be possible—and I am asking this as a question—to put into the hands of the woman, the consumer, the buyer, certain very simple specifications or standards by which she shall be able to judge when she goes into a store, something about the relative efficiency of units, something about electrical washing machines, something about vacuum cleaners, something about relative costs.

There still persists in the mind of our buying public the impression that if you pay the most for something you get the best out of it. That, of course, isn't always true. Is there some way of focussing attention on the efficiency of the piece of equipment rather than encouraging the woman perhaps to use a green stove rather than a gray one? The color may be important, but after all the efficiency of the piece of equipment which she is buying is of tremendous importance and is her real reason for making the purchase. Can you strengthen her hands in some way so that she shall make fewer mistakes in the future, which is, of course, to the good of all of us.

4. Then is it possible to offer women careful training in the selection, in the use, in the care, and probably the simple repair of household equipment? I have stated heretofore that women in this work are particularly successful, more successful than men.

May I just make one suggestion here? Take it for what it is worth. It seems to me as a home economist that you as sellers of electricity and electrical equipment can best serve the home-maker by giving her information which has to do very specifically with your field of work,—the use of electricity in equipping her house, so she may use electricity to the best advantage. There are a great many places where she can get recipes, where she can be taught proper combination of foods, and it would seem to me that you as a group would be rendering a more specialized kind of service for which the home-maker has inadequate opportunities, if you would specialize along the lines of teaching her to use equipment rather than offering cooking schools.

5. May I suggest also that care be exercised in putting into a home only suitable, needed equipment so that the budget can be carried through without undue worry or strain.

6. If I may be permitted to emphasize one special need, it would be the need of the farm home where there is still in many instances an undue, almost an unfair amount of manual work still to be done. If I were pointing out the thing that seems to me to be your large social opportunity, it would be the opportunity to bring to the farm, and to the farm home, electrical equipment and electricity at a rate which would make it possible for the farm homes and the farm to have a chance to participate in this tremendous power that is at the finger tips of most of our urban people in order that the lag behind what we might call our "general culture level" may not be so great. Surely cheap electricity, efficient power-driven tools and equipment would be a great boon to the farm women. At the present moment it may well have an even more far-reaching effect than that of labor saving. Since again and again farm accounts reveal the fact that it was the chickens, the turkeys, the garden that made the difference between loss on the one hand and profit on the other, we might pause to consider whether the release of the woman's time and energy through the use of power machinery and her use of them in some productive effort might not only offset the cost of the machinery, but contribute to farm profits.

Perhaps this may seem a bit indirect so far as the problems of the home manager are concerned, but I think it is important. If it were possible to introduce on our farms substitutes for farm help—those substitutes may be electrical helps—it would rid the farm home-maker of a good many problems, not simply the physical problem of feeding and housing hired help, but the other problems much more serious to all farm women of having to keep in the household the kind of people who are at the present time likely to be available for farm help, who complicate the family relationships, and the problem of child training. If we could get the farm help "out of the house," as one woman said, we would be helping the women a long way in their home-making problem on the farm.

Electricity's Part in Home-Making

We must, of course, acknowledge the limitations of electricity in accomplishing the full program of home-making. A few years ago at an electrical show there was displayed a baby spanking apparatus. I am not even sure that that would be effective on all occasions. (Laughter.)

We know also that we cannot depend upon electrical robots to train up children in the way they should go, to offer us the solace and inspiration of devoted members of our family. Nevertheless, we can use it as a tool in making the machinery of housekeeping operate more effectively and with less human effort. The wise home manager, whenever it is within the range of her budget, will make large use of electricity.

As I see it, the chief aims of every home-maker are as follows: To see to it that insofar as possible her home is economically sound; that it is mechanically convenient; that it is physically healthful—and, of course, it goes without saying that we want our homes morally wholesome. We also want our homes to be mentally stimulating. We want them to be artistically satisfying; we want them to be socially responsible; we want them to be spiritually inspiring, and supporting it all, of course, we want our homes to be founded upon mutual affection and respect.

As I see it, wherever electricity can aid in accomplishing this aim, there is its place in home management. (Applause.)

CHAIRMAN OWENS: Miss Bane has made a real contribution not only to this program but to the industry. Miss Bane, on behalf of the industry I thank you for these valuable and pertinent suggestions, and for your very splendid contribution.

I ask your indulgence for just a moment, please. Is the nominating committee ready to report? Mr. Dick, will you come to the platform, please?

While Mr. Dick is coming to the platform, I think if Miss Bane has not done anything else, she has emphasized in our minds the advantage of having a department in our business in close contact with the home, a Home Service department.

Mr. Dick, Chairman of the Nominating Committee!

Nominations

MR. JACKSON DICK (Georgia Power Company, Atlanta, Ga.): The Nominating Committee has suggested the following names:

T. A. Kenney, Allied Power & Light Company, New York.

H. B. Flowers, New Orleans Public Service, Inc., New Orleans, La.

R. T. Smalley, Kansas Electric Power Co., Lawrence, Kansas.

E. A. Barrows, Narragansett Electric Co., Providence, R. I.

Leavitt Edgar, The Edison Electric Illuminating Co., Boston.

D. C. Green, Electric Bond & Share Co., New York.

Paul Dowling, Pacific Gas & Electric Co., San Francisco, Cal.

S. E. Skelley, Pacific Power & Light Co., Portland, Ore.

V. L. Board, Public Service Company of Colorado, Denver, Colo.

Jos. Gill, Florida Power & Light Co., Miami, Florida.

T. D. Crocker, Northern States Power Co., St. Paul, Minn.

L. B. Herrington, Kentucky Utilities Co., Louisville, Ky.

W. S. Vivian, Middle West Utilities Co., Chicago, Ill.

F. R. Phillips, Duquesne Light Co., Pittsburgh, Pa.

John Coghlan, Pacific Gas & Electric Co., San Francisco, Cal.

Nominations, aside from those submitted by the Nominating Committee, may be made from the floor.

CHAIRMAN OWENS: If there are no other nominations, what is your pleasure with regard to the report of the Nominating Committee? A motion to adopt the report will be in order if there are no other nominations.

MR. MARTIN J. INSULL (Middle West Utilities Co., Chicago, Ill.): I move the report of the Nominating Committee be adopted.

[The motion was seconded, put to a vote and carried.]

CHAIRMAN OWENS: That concludes the program. Thank you very much indeed for your attendance.

[The meeting adjourned at 5:10 p. m.]

PUBLIC POLICY COMMITTEE SESSION

PUBLIC POLICY COMMITTEE SESSION

THURSDAY, JUNE 6, 1929

[The meeting convened at 9 p. m. in the ballroom of the Auditorium and Convention Hall, Atlantic City, N. J., Mr. W. W. Freeman presiding.]

CHAIRMAN FREEMAN: It is a source of regret to all, I am sure, that Mr. Ballard, the Chairman of the Public Policy Committee, who should preside at the session this evening, if he were here, is unable to be with us on account of absence abroad.

Before introducing the first speaker on the program this evening, I wish, in behalf of the Committee, to make acknowledgment of the courtesy extended to our Association in connection with broadcasting of our program of the evening by the National Broadcasting Company, through the courtesy of its President, Mr. Aylesworth. The report of the Committee, and the address, will be broadcasted over a network of twenty stations, and the Committee desires to express its appreciation of this courtesy on the part of the National Broadcasting Company.

It is fitting that the first speaker of the evening should be our President, who, as Chairman of the Committee of Award of the Charles A. Coffin Medal, will present the report for this year. Before calling upon Mr. Arkwright, it is suggested that I announce the winners of this award in past years.

The award has been given each year, beginning with the year 1922, the company winning that year being The Southern California Edison Company. In 1923, Public Service Company of Northern Illinois; in 1924, the Consumers' Power Company; in 1925, the Commonwealth Edison Company; in 1926, the Edison Electric Illuminating Company of Boston; in 1927, Puget Sound Power & Light Company.

I am now glad to make way for President Arkwright to present the award for this year.

PRESIDENT ARKWRIGHT: Ladies and Gentlemen: Before announcing the award, I would like to report to you that in accordance with your direction and authority, we sent a cablegram to Mr. Owen D. Young, at Paris, expressing our congratulations on the successful outcome of the Reparations Conference, and your pride in the part that he has taken in bringing about the happy result.

I have a reply from Mr. Young to that cablegram, which I will read to you:

"P. S. Arkwright, National Electric Light Association, Atlantic City: I send to you and through you, to my friends and associates in the National Electric Light Association, my heartiest thanks for your and their thoughtful message. I regret that I cannot be with you, and I send you all my best wishes for the success of your convention.

(Signed) "Owen D. Young." (Applause.)

REPORT OF CHARLES A. COFFIN PRIZE COMMITTEE

BY P. S. ARKWRIGHT, *Chairman*

(For Committee Personnel, See Appendix 4)

I consider the presentation of this report one of the distinct privileges which goes with the office of President of your Association, for it gives me the opportunity to not only award and congratulate an outstanding Light and Power company for its work during the past year, but also to pay my respects to the memory of a man who in his time was a great leader in our industry—Charles A. Coffin.

Few men knew so well the problems of the producers and distributors of electricity as Mr. Coffin, and few have ever been as helpful as he was to those responsible for the progress of the industry. In the past, the company serving great urban centers or far-flung territories of considerable importance have received this award, but this year the honor is to be bestowed on a company of slightly over 19,000 customers. Its urban territory is separated from any other city of any size by over 600 miles; interconnection is out of the question. One large section of its population is foreign, with a distinctly lower standard of living than that of the native citizens. Yet, despite its comparatively small size, the many indications of difficulties surrounding its growth, this company has grown, has progressed, and has played a part which your Committee feels constitutes a distinguished contribution to the development of light and power for the convenience of the public and for the benefit of the industry.

The Committee hopes this award will be an inspiration to the managers of the smaller companies operating throughout the nation. In every field, general administration, commercial activity, and engineering, a splendid job has been done by an active, aggressive management. I think it is no exaggeration to say that the fact that this company with notable resolution and tenacity, has submitted statements of its accomplishments for five separate years, has in no small measure helped in making its fine record in all fields.

It gives me pleasure to announce the Award of the Charles A. Coffin Medal for 1928 to the El Paso Electric Company. (Applause.)

Will Mr. F. J. Gannon, Manager of the El Paso Electric Company, please come forward?

[Mr. Gannon came forward.]

Mr. Gannon, of the El Paso Electric Company, I congratulate you upon the accomplishments of the company under your management. I present you, on behalf of the Charles A. Coffin Prize Committee of the National Electric Light Association, the Charles A. Coffin Medal, for having made a distinguished contribution to the electric light and power industry, for the convenience of the public and the benefit of the industry. It is my pleasure, also, to present the Certificate of Award and a check for $1,000 for the use of your Employees' Benefit Association.

I extend to you, likewise, my personal congratulations on your fine work.

MR. F. J. GANNON (El Paso Electric Company, El Paso, Tex): In accepting the medal given as the emblem of the Coffin Award, I feel very much like David must have felt when Goliath fell. A small company, comparatively speaking, situated in the far West and little heard of, unleashed a stone from its sling and sent forth its brief to the Coffin Award Committee with considerable hope and prayer. Tonight the prayer has been answered and we feel exactly as David must have felt in the days of old.

Many of you may never have known that El Paso had an electric company, and you probably feel that those of us who live in West Texas are different than those of you who live in the East. As a matter of fact, we who live in El Paso are very much like you people in the East—doing what we can at every opportunity to promote public service. We have generating stations and we are self-reliant. We are six hundred miles from anyone else and do not have the benefit of interconnecting power such as many of you enjoy. The generating stations that we have on the South of the Rio Grande in Juarez do not generate the kind of power that we can advantageously connect to our lines.

The giving of this Award to El Paso Electric Company is an outstanding instance of the benefit of centralized management and the coordination of public service operations in large companies. Had we not been able to secure the advice and help and assistance of the organizations with which we are affiliated, I doubt very much if El Paso Electric Company could have accomplished the things that have made possible our present success.

In accepting this Award, I want to express to the members of the Coffin Award Committee and the members of the National Electric Light Association the deep appreciation of the executives of our company for the recognition they have made of the faithful, excellent and loyal service given by the employees of El Paso Electric Company as well as the people of El Paso, without whose cooperation nothing would have been possible.

REPORT OF THE PUBLIC POLICY COMMITTEE

BY W. W. FREEMAN, *Vice-Chairman*

(For Committee Personnel, See Appendix 4)

I have the honor to submit the Report of the Public Policy Committee for this year as follows:

This year is LIGHT'S GOLDEN JUBILEE. It is fifty years since Edison gave to the world the first practical electric lamp. In this lamp, the electric utilities had their beginning; from it has developed the whole field of electricity's usefulness. It is fitting, indeed, at this time that we express tribute and appreciation to Mr. Edison and that we take some measure of the progress made by these utilities in expanding usefulness and in meeting public obligations in the provision of electric service.

Amid the rapidly expanding and changing character of electrical development, one policy stands out as having been uniformly and consistently followed by all and at all times. This is the policy of growth and expansion. The electrical industry has been progressive; it has not stood still. From the beginning, the men responsible for electrical development have realized the enormous contributions in useful service which electricity has made and will continue to make to the whole national and community well-being, to workers and to homes, to all phases of economic and social life. They understand and assume the obligation to unfold the full possibilities of electric service and translate them into everyday use for all the people, on the farm, in village, and in large city. In its plans, its construction of plants and facilities, its organization and financing, the industry has looked to the future. Not only has it quickly adopted advances, but it has stimulated and searched for them.

Year by year electric service extends; more homes are electrified, domestic use increases and takes on new forms; the service reaches to smaller and smaller towns and on to the farms; electricity is becoming the essential power supply for all purposes; the quantity of power made available for each worker increases. There lie ahead fields of still greater expectation for new and larger uses. The policy of aggressive development and expansion is still essential.

Herbert Hoover made the following statement before the World Power Conference in London, 1924:

"The factor that has been primarily responsible for the tremendous changes of the last century and without which modern civilization could not exist is mechanical power. The form in which in increasing degree such power is being applied is electrical energy—the greatest tool that has come into the hands of man. The degree to which we utilize this tool as a substitute for manual labor will largely determine the rate of our social and industrial progress."

Electrical development is progressing at a rapid pace. During the past seven years electrical service was furnished to nine million homes, bringing the total to 19 millions. No full measure can be taken of the benefit of this in improving family life, effecting economy in expenditure, the saving of time and making for happier living. Electricity has provided a power supply not only for the factories but also for the homes. Thousands of electrical appliances are assuming the burden of housework.

Extension of Service

A distinct characteristic of electric progress in the last few years has been the extension of service to small towns and farms. Transmission lines, constituting a vast network even five years ago, have been still further extended to reach 4000 small towns and villages formerly without electric service. So widespread has the service now become that almost every community with over 1000 inhabitants has electricity, and in many parts of the country, every community, no matter what its size, receives such service. Not only do they enjoy benefits of electricity in their homes, but by it the door of industrial opportunity has been opened to the smallest town having also reasonable transportation facilities. The spread of service to the farm continues, until now 500,000 farms are connected. The objective of electric service for all the people comes nearer and nearer to attainment.

With the development of great interconnected systems and mass production of power, the factories and workers of the nation are increasingly turning to electricity for power supply. The total increase of 9,800,000 h.p. in the nation's industrial enterprises since 1919 has been in electric motors. President Hoover's Committee on Recent Economic Changes in the United States, in its report on May 15, 1929, after emphasizing the widespread higher living standards as characteristic of our national life, pointed out that the rise in the use of power has been three and three-quarter times faster than the growth in population, and then added:

> "The increasing flexibility with which electricity can be delivered for power has enabled manufacturers and farmers to meet high labor costs by the application of power driven specialized machines; and power in the flexible form has penetrated into every section of the United States, including many rural areas.
>
> "The survey shows that as a nation we now use as much electrical energy as all the rest of the world combined.
>
> "Through the subdivision of power, the unskilled worker has become a skilled operator, multiplying his effectiveness with specialized automatic machinery and processes. Thus the unit cost of production has been reduced, the drudgery eliminated from much unskilled work and wages maintained or actually increased."

There has been a clearer crystallization of public understanding of major trends and developments. The far-reaching economic and social benefits of interconnection, mass electric production and large scale development have become better understood. The function and usefulness of the holding company in bringing this about has become more generally understood. Mere size of operations causes less comment; the benefits accruing to the public from them are better comprehended. The public generally realizes that through large scale development electric service is becoming possible to the citizens of the smallest village and to the dwellers upon farms; and that only in this way has there been created the reliable, adequate, and low-cost power supply upon which the nation's industrial development is taking place. Experience has demonstrated the savings in expense, the financial stability, the fuller utilization of investment and resources, the increased efficiencies, and larger capacity for service which follows unification and consolidation. They are accepted as economic necessities. Failure to apply them would indicate lack of progress.

Individual Enterprise

Through the application of these principles, "as a nation we now use as much electrical energy as all the rest of the world combined." And it should not be overlooked that all the rest of the world combined hitherto has, to a very large extent, followed the policy of governmentally owned and politically operated electrical supply, while this nation has followed the precept of the immortal Lincoln that "in all the people can individually do as well for themselves, government ought not to interfere."

The benefit of improved efficiencies, better management, large scale development, and advances in the art, have been shared with the consumer. An outstanding characteristic of the past year has been rate reduction. The general cost of living continues at 70 per cent above pre-war levels; domestic electricity is 25 per cent under pre-war levels. In 1914 the average household used but 268 units of electricity; in 1928, the average used was 456. Beyond this, electricity today will do more than it was possible for it to do then, for scientific advance has provided the consumer with better and additional methods of utilizing it.

Purchase of Security Offerings

Large increases in demand for service; the necessity for large investment in facilities, which is characteristic of the business; the greater cost of furnishing service as it extends to sparsely settled territories, continue to require large sums of money in financing growth. In the year 1928, during this period of intensive Governmental investigation, continued public confidence in private operation was demonstrated by the purchase of one billion six hundred million dollars of security offerings of electric light and power companies.

The year just passed has been particularly noteworthy for the public attention directed to the electric utilities. Their condition, methods, practices, and performances have been a major subject of public discussion, which has ranged from vituperative attack and political abuse to sober and constructive consideration of major questions, and has covered most of the degrees between. Utilities today live under the microscope. In the scrutiny they have undergone, real performance in public service has often been overlooked, faults have been magnified, and motives distorted. But on the whole, discussion has redounded to their benefit and will do so still more when complete information becomes diffused and the public mind better informed.

Federal Investigation

The source of inquiry has largely been the Federal Trade Commission. Up to this time, its investigation has been directed largely to the National Electric Light Association, its Geographic Divisions and to publicity activities. The broad work of the Association toward accomplishment of its object—"to advance the art and science of the production, distribution and use of electric energy for public service," has as yet received slight attention. The local State Information Bureaus have been thoroughly investigated.

Although the Association as well as its Divisions and the State Bureaus were early apprised that there was doubt whether the Federal Trade Commission could compel the furnishing of much of the information sought, a decision was reached at the outset to comply completely and promptly with every request of the Commission. In accordance with this decision, the Commission representatives have been accorded full and free access to all books, records, papers, reports and correspondence of the Association. No request has been refused. No question of right or authority has been raised. The result has been a most rigorous inquiry into every activity of the Association for the last twenty years. Over 100 witnesses have been heard, over 7000 pages of testimony have been transcribed, and 4300 documents and other exhibits have been introduced into evidence. We have voluntarily undergone a microscopic examination which has delved into records from the dust-covered volumes of the past to the fresh ink of the present, and into thousands of scattered incidents arising from one end of the country to the other.

We understand that this phase of the investigation on the Commission side is now practically completed. The Commission as yet has announced no conclusions. The industry has not, as yet, presented evidence in its own behalf.

Public impressions have come almost entirely from newspaper reports.

Sound Policies Followed

Your Committee is confident, as the result of this critical review of the activities of the Association for the last half century, and without claiming perfection, that it will be found that its policies have been sound, its work beneficial to the public and the industry, its ideals consistent with the highest American business standards, its mistakes few and trivial considering the number of individuals involved and the large volume of work accomplished.

An independent press is essential to free government. The National Electric Light Association believes in an uncontrolled and undominated press, free to criticize or commend as conditions may warrant.

The utilities recognize that the furnishing of information regarding their purposes, accomplishments, needs and difficulties is one of the obligations of public service. In recent years, the Association and its member companies have made every effort to inform customers, investors and the public. To that end, the Association has utilized every opportunity for creating a more complete public understanding. On matters of opinion, it has stated its own views; on controversial subjects it has given its own side. Endeavor has been made to correct inaccuracies and misinterpretations. It has done so openly and frankly. Publicity material of the Association has always shown the source so that everyone to whom it was sent has known from whence it came.

There may have been occasional instances of overzeal in distribution, but we may congratulate ourselves that criticism has been directed to excessiveness of publicity rather than to secretiveness.

True and Accurate Information

At the last annual convention, this Association by resolution recommended to its members a continuation of the policy of preparing and diffusing as widely as possible full, accurate, and timely information on all phases of the business. Truth and accuracy were declared to be the standard by which its statements should be judged. Your Committee is glad to be able to report that out of the large volume of publications and informational items circulated by the Association, all of which for recent years has been freely submitted to Commission scrutiny, none has been found which cannot stand that test. The adverse comment which has been made upon Association publicity has not been directed to its truth or accuracy, but rather to its volume and methods of distribution. The same is true, with few exceptions, of the publicity emanating from the local State Bureaus.

The widespread distribution of informational material necessarily involves contacts with those who receive it. From the furnishing of data to schools and colleges come relationships with those who use it. Such contacts are proper, natural, necessary, and desirable for all concerned, if informational service is to be efficient. The relationship necessitates a high standard on both sides. It is inconceivable that the industry should refuse any reasonable request for information helpful to those engaged in public instruction. It is improbable that teachers in our schools or instructors in our universities would accept for their use any material which is not truthful, accurate, and valuable, even if an attempt were made to foist the opposite character upon them. The whole question of cooperation and relationship between education on the one hand and commerce, business and industry on the other, is one of common concern, by no means confined to the utilities. It involves practically every great American industry. The methods must be finally determined by the educational authorities. The electric industry has always cooperated with them in the fullest degree. It desires to continue to do so. It hopes that in the near future, a more definite basis for that relationship will be worked out and declared by those responsible for educational methods. The industry expects to conform with their final policies.

A Leader in Research

The electrical industry has long been recognized as a leader in research. In the laboratories of the electrical manufacturers and in the field experimentation of the operating companies, there has been ceaseless search for new truths, added applications, and further harnessing of this great instrument for the benefit of mankind. This effort has been rich in rewards, shared not alone by the electric industry and its customers, but aiding other industries and reaching into the lives of all the people. With the formulation of the great program for stimulation of Pure Science Research, under the direction of the National Research Council, the National Electric Light Association, in behalf of the electric light and power companies, is glad to announce its full participation in the movement. The National Electric Light Association thus confirms its confidence in the body of men devoting their lives to research who have already given so much and who have in their hands the unfolding of a still richer future.

Ours is a responsibilty for bringing to the American people the best electric service at lowest possible cost which human capabilities can accomplish. To this end the National Electric Light Association and its members rededicate themselves. (Applause).

CHAIRMAN FREEMAN: Just a word of explanation. The program at this time is in cooperation with the National Broadcasting Company. We are going to be favored with several selections from two well known artists. The announcements will be broadcast by Mr. Peterson of the National Broadcasting Company. I will assure you he can do better than I.

[Selection by Mr. Spalding.]

CHAIRMAN FREEMAN: The National Electric Light Association desires and expects to keep in step with the business interests of the nation in respect to the highest standards of ethics and business practice. It is fitting that tonight we should be favored with the presence of a gentleman who perhaps better than anyone else in the country at the present time can speak with a voice of authority and advice as representing the premier business organizations of our country. Undoubtedly the Chamber of Commerce of the United States represents, as does no other organization, the organized business interests in all its branches, of the nation, and if the Chairman of the Board of Directors of that Chamber cannot speak with authority and conviction, it is difficult to imagine anyone else who can.

Mr. Barnes has honored us by selecting as his subject, the topic, "America's Fifty Years of Aladdin."

I have great pleasure in presenting Mr. Julius H. Barnes. (Applause).

AMERICA'S FIFTY YEARS OF ALADDIN

By JULIUS H. BARNES

Chairman of the Board of Directors of the Chamber of Commerce of the United States

This occasion tonight marks the Golden Jubilee of the Electric Light. It provides, as well, a popular testimonial of admiration and affection for the inspired labors and for the simple life of America's foremost inventive genius. Fifty years of spotlight distinction have invested his character with a national regard bordering on reverence. That half century of time spans a period in history of most intense human interest. Certainly no other half century in world history could possibly have equalled the myriad changes of this single era. The contrasts disclosed by a comparison of the living habits of these dissimilar days have clearly widened the horizon of human health, welfare, opportunity and content.

A peculiar interest would attach to that comparison because these changes have come within the span of a single life. When that single life itself, as in the case of Thomas Edison, has been also a potent force in working the miracles in modern science and invention, it acquires a unique distinction. It would be a title clear to fame for a single mind to carry into practical perfection a device for lighting which has been improved but not displaced by fifty years of intensive inventive progress. But Edison's distinction rests not alone upon the idea of a light itself, but on the wider, daring conception that the subtle force of electricity could be harnessed to control, and be distributed flexibly at point of use. Even Edison's painstaking study and even Edison's soaring imagination could not at that early day have visualized that the wire which entered America's homes for lighting would have later become the channel of fluid power which established in every individual home its own power plant. It would be interesting if today there could be preserved the changing images of the inventor's mind as he saw the feed wire, planned for simple lighting alone, drawn upon in the course of time to successively operate the electric iron, the vacuum cleaner, the washing machine, the electric range, the refrigerator and the radio. So, also, it would be interesting to visualize the successive steps, with accelerating speed, by which the flexible power distribution of which he was the pioneer so provide itself in competitive use for industry that it has revolutionized the power plants of our factories.

The Force Behind Progress

Industry has always had its sources of power: the water wheel, fuel generated steam, the combustion engine—but none of these serves industry so directly and with such economy as does the flexible force carried to its point of use through the distribution inspiration of Thomas Edison. His concept of fifty years ago of ready distribution, limited in vision, as it was, of necessity, in that day, is the basis today for American homes freed of household drudgery; of American farms lifted from the shadow of relative isolation; of industry that has put a premium on intelligence and skill and lifted the crushing burden from the bent backs of labor. Flexible power, easily transported, is the moving force in successive inventions that raises steadily the general average of possession and living.

The science of electricity is indeed of world-wide origin and development. The super-intellects of all peoples have contributed to its understanding and its use. We measure the practical unit of electrical resistance today in the name of the German scientist Ohm. We measure the flow of electric current along a wire in the name of a French mathematician Ampere. We measure the force required to cause a current to flow against resistance in the name of the Italian physicist Bolta. We express the unit of electrical power in the name of a Scottish engineer Watt. But in all of America and throughout the world, every shade and variety of electrical service, the finest of subtle pulsations and the most tremendous physical forces are expressed to every understanding with the single name of Edison. No single mind today has contributed so largely to our whole social advance and when, as well, that single life has preserved the simplicities of living unswayed by an adulation which falls to few men in history, it is the reassurance also of the real quality of America. All America does itself honor to honor in this Golden Jubilee the intellectual achievements and the personal qualities of the man whose name is inseparably linked with that subtle fluid energy which is the very life of modern living. His name will be remembered as long as man can speak and as long as man can hear.

A Half Century Ago

Now, half a century of human progress spanned in this field by a single life, and that life the acknowledged leader, must present comparisons of extraordinary popular interest. What were the habits of industry; what were the social customs; what were the popular conceptions and ideals of the world of fifty years ago, and how have they changed for good or ill? Since the daily press of a people probably most accurately reflects the everyday practices and customs which enable us to gage the conditions of their living, it is interesting to go back to the newspaper of half a century ago.

For example in *Leslie's Weekly* of 1879 there is a news item recording a patent granted Thomas A. Edison for electric lighting apparatus—an insignificant item in itself and manifestly conveying at that moment neither to publisher nor to public anything of the vast import which fifty years of history have since recorded.

Something of the coming revolutionary character of this invention is shown shortly thereafter when the New York *Sun* comments editorially on the panic in gas company shares which had been occasioned by the manifest progress in electric lighting. The editorial suggests that the investment in gas manufacture and distribution might be saved "if gas could be made available for cooking, and ladies could thus become expert cooks." As a matter of normal development since, gas has become the universal cooking fuel of our great cities and, of course, every lady in this audience and that of the radio can testify that she has become, and is, an expert cook. Otherwise how account for the spread of the delicatessen and its ready-cooked foods?

Pioneer Advertisers

Advertising in the newspaper of fifty years ago averaged about 20 per cent of its content, and today 60 to 65 per cent, although today's news columns cover home and world news with a completeness which was not possible with the limited communications of those early days. This is why we buy a daily newspaper today for half the price, though with four times the news. The limited advertising of New York newspapers fifty years ago, however, shows a continuity of American business which is extraordinary—Lord & Taylor, Daniels, Stern Bros., Macy's, Hearn's, Altman's, Sloane's. Their vast assortments and their imposing buildings in the very heart of Fifth Avenue fashion today are the half-century outgrowth of dependable merchandising which, at reasonable prices, pioneered the columns of half a century ago. Knox Hats, Cuticura Soap, Worcestershire Sauce, Royal Baking Powder were then taking the first uncertain steps which have made them household names today. Colgate's Soap showed a pioneer initiative in eliminating the depression of summer trade by advertising then that "since the soap improves by age and drying, a supply laid away by families leaving the city would be found improved on their return in the fall."

There was a large advertisement in which all visitors to New York were entreated not to fail to see the electric light "now in use at Nicoll the Tailor's," and which added, further, that they possessed a telephone for customer's use and that steam machinery was used in running sewing machines and all scientific improvements. Here was merchant resourcefulness applied certainly with foresight and vision, though if today's 300,000 daily visitors to New York should attempt to see the electric light in the present shop of Nicoll the Tailor, still on Broadway, it would, of course, require the police reserves.

What the Newspapers Lacked

There were no newspaper advertisements, of course, of automobiles or accessories, the backbone of today's newspaper and magazine support; no office equipment, no sports, no apartment or office buildings, no radio, no airplanes, no public utilities, no banks with page spreads or companies offering securities in nation-wide industries, no foreign securities offered to the American financial market. There was no refrigeration, no advertisement of electric devices or gas appliances. There were no advertisements of summer resorts or hotels. Evidently the American clientele that could travel or take vacations was too small to carry the expense of appeal.

There is an interesting sidelight in the advertisement of the elevated roads of New York, on which the traffic was made to bear what it had to, by charging ten cents fare between 5.30 and 7.30 a.m., and ten cents between 5 and 7 p.m. Between-times, you could travel for a nickel. Think of the working conditions of fifty years ago, which made the morning rush hour of city transit start at 5.30 a.m. and end as early as 7.30 a.m. Those are the hours today at which you could be sure to find a seat. The evening rush hour, which then extended to 7 p.m., is today finished by 6 p.m. The shorter working day, which this so vividly illustrated, not only marks the conquest of extreme drudgery in daily occupation, but it is beginning to be intelligently understood by industry itself that reasonably balanced working hours and reasonable leisure, with adequate wage scales, are the very heart of universal use and buying which maintains industries themselves. In the working hours of that early day the automobile would have lacked a market, not alone for wage scales which had no margin for the purchase of such a modern-day convenience, but a working day which had no time to use or enjoy such a facility, and a working day that left little strength or energy except for bed or dissipation. As early as 1860 we had gasoline, but it was worthless, for invention had as yet found no way to use it.

Strong Men of the Day

The pioneer industry of that day had its strong men whose names and achievements are grafted into American history. The columns teem with the names of Huntington, Harriman, Rockefeller, Carnegie, Morgan, Clark, Armour, Hill, Gould, Fiske and Cooke. The field in which these financiers laid the foundation for industrial leadership and large individual fortune was small indeed. The Stock Exchange recorded a turnover of 100,000 to 200,000 shares a day, against today's 5,000,000. The financial columns showed these men and others possessed of large vision and supreme daring. There run the tales of large risks assumed, success in industrial development, paralleled with gigantic losses, under the standards of that time.

These straws illustrate the way in which social custom and modern industry have, step by step, developed together the earning power which has widened the range of articles of use and convenience in common possession and have created leisure to enjoy and demand more things in everyday life. From the beginning invention has been the life-blood of suggestion, creating new articles of universal aspiration.

America was still a pioneer country with resources yet to be developed, with latent wealth still awaiting the mind and hand that could fashion it to human service. Remember that Edison's electric light was only three years behind the year of the last great tragedy of America's receding frontier in the Indian country; 1876 was the year of Custer's Last Stand, the final tragic resistance of the red Indian to the oncoming wave of American settlement. It still comes as a shock to most of us that the lives of many of this audience have spanned the period between the Indian frontier and today's complex civilization. Measured in changes of customs and habits, measured in the expansion of old industry with the miracle growth of population and buying power, measured in the role of new inventive industry which those early days could not even imagine, this period of fifty years stretches interminably in the imagination.

The Long Record of Time

But in the long record of Time itself, how short the span, indeed! I remember recently hearing this perspective illustrated by Charles F. Kettering, himself an inventor of international eminence. He recalled that last year Roy Chapman Andrews found in the Desert of Gobi, in the heart of Asia, a great dinosaur skeleton, and the geologists looking over the strata in which it was found estimated it had been there eighty million years—quite a long time. So they said, "It is petrified and nothing of any vitality could be existing for eighty million years." "But," added Kettering, "Harvard University had an astronomical laboratory down in Africa, and last year they photographed a nebula—a spiral nebula—and the light that affected the photographic plate in that camera last summer left its source one hundred million years ago. Light travels at the rate of 186,000 miles per second, and if you reduce 100,000 years to seconds and multiply the result by 186,000 miles, you have the distance in statute miles. In other words, that light which affected that photographic plate last summer left its source twenty million years before the dinosaur was born."

Then Kettering goes on to point out that the human race has been conscious of itself only eight thousand years. If you could take the eight thousand years in which the human race has been conscious of itself and put it into that 100,000,000 years, and stir it up and turn it over to a chemist to analyze, he would analyze that thing and report, "That looks to me like pure Time, with the exception of just a slight trace of impurity in it which we call Civilization." If you would take the two thousand years of the Christian era and dissolve it in that 100,000,000 years, the scientist could not find even a trace of it.

The Deathless Quality of Mind

There is just one quality which man possesses which is deathless in itself and which makes the race able to look even pure Time in the face with self-respect. That is the deathless quality of Mind, the divine restlessness of intellect which explores the unchanging mysteries of Nature itself. It is the faculty which enables man to comprehend natural law and harness under that law the forces of nature to man's service. Somewhere back in the misty days of our early race, the element of fire having been discovered by accident, there was mentality enough for the race to see that light and heat were associated by natural law together. There are today the evidences that the early caveman chipped niches in the rock walls of ancient caverns in which fire was evidently built for lighting only. Then rushes were used, soaked with grease and splinters of resinous woods like pine; then the rushlight style of lamps in which wicks soaked up oils from an open dish. Then before the Christian era, through centuries of experimentation, waxed candles had been made from pressed honeycomb, and then the tallow candle followed. Oil lamps originated with sperm oil from the whale fisheries a century and a half after the landing at Plymouth Rock. Then some Edison of a century and a half ago developed the metal chimney which steadied the flame of an open lamp, and then came the glass chimney which made the oil lamp really practicable. Then man's intellect comprehended the possibility of controlling illuminating gas for lighting, and so good a mind as Napoleon's condemned the whole effort to substitute gas in the place of candles as a "grand folly." Sir Walter Scott ridiculed the "mad man" who proposed to light the streets of London with smoke. It was difficult in the early days to get lamp-lighters to approach the gas posts for street illumination to light the gas.

Less than one hundred years ago the Philadelphia Common Council received a petition against the use of gas, stating that its "immense destruction of property was nearly as fatal as gunpowder."

Obstacles to Progress

Always the pioneers of science have had to overcome not only the mysteries of natural law, but to overcome the inertia and opposition of human intellects slower than their own. Curiously enough, too, the study of invention progress shows that invention is rarely the inspiration of a moment, but more largely the laborious product of toilsome study and experimentation. The natural law by which heat and light are inseparable, which was recognized by the caveman who built his little fire in the rocky niche to give him light, was the law which enlisted the painstaking study of Edison to find a practical light that could be carried into every nook and corner. Recognizing that light was inseparable from heat, his early experimentation was toward finding a substance so high in melting point that the heat of a current-producing light would not destroy the substance itself. This early suggested carbon. It would be stimulating to the active minds of today that dread the slow laborious process of observation to read the history of the numerous experiments of Edison to find a practicable carbon for the use of lighting. He sent explorers at great expense over all the world for fibers. The charring of various materials runs through the whole gamut, from tissue paper, through all kinds of thread, lime, celluloid, shavings and cork; and in those early days bamboo fibers gave the best results. Learning that carbon burns in the air, his early lamps were exhausted of air by a hand-pump. It required the inventor's tenacity of purpose to carry through the early obstacles to the success which we celebrate tonight. That nature marked him early for special distinction in this field is indicated by the fact that he experimented with chemicals in his father's cellar at the age of eleven, and at fifteen possessed important books on chemistry and physics, and carried his own experimental apparatus in the baggage car on the train on which he worked as newsboy between Port Huron and Detroit. Something divine and deathless drove him into this field in which, measured in terms of human service, he has a supreme distinction.

What Does It Profit?

We have today bewildered minds that stand by the wayside and call for the return of the good old days before machine civilization. "What does it profit a race," they say, "if living is made soft and easy, and thereby sturdy character is undermined?" "The new security of livelihood must lead to relaxed effort, to lowered standards." "What is the contribution to human welfare that we pile our great temples of industry story on story, reaching high heaven itself?" "What does it mean other than gross materialism that we invent the radio?" they say. Does it mean nothing to them that the intrepid explorers of the Polar South hold daily contact with civilization through this mysterious triumph of invention? Does this daily contact, which includes even the programs of music and light-hearted entertainment from the cities they have left behind undermine the fiber of men who dare the mysterious hazards of the Antarctic wastes? Do our 25,000,000 automobiles, which have made the open road also the open door to health and to family picnics that replace the corner saloon, mean nothing to them except a supposed decadence of individual character? Does the miracle of the motion-picture, seating its daily audience of 14,000,000 and bringing to them through eye and ear the daily news of a now-contracting world, mean nothing to them in quickened intelligence, wider understanding, and the inspiration of limitless opportunity? Does the new invention of the airplane, which makes every interior city a potential world port, spell to them an undermining of the qualities of personal daring and courage? Does it mean nothing to them that modern industry, developing under the profit motive, to be sure, has nevertheless made a direct contribution toward elimination of sickness and suffering, and even held death itself at bay for longer spaces?

For example, the modern refrigerator, the perfected metal and glass containers for perfectly preserved foods, the vacuum cleaner with its daily cleanliness, the automatic heater with its equably preserved temperatures of the home—these are the things, along with advances in professional knowledge, that vanquish countless human tragedies. This is illustrated by the fall in the death rate of the United States from 17 per 1000, the average of twenty years ago to 12 per 1000, the average of these recent years. That means 600,000 less deaths per year than twenty years ago. Resolve that, if you please, into the countless homes that are thus protected against individual sorrow and desolation. Should inventive industry and the trained professional mind take no pride in 600,000 fewer death tragedies in American homes each year?

No Fear for the Sturdy Virtues

And to illustrate to you the intimate interlacing of social service and industry itself, this fall in the rate of deaths, clearly the product of improved hygiene and sanitation, is itself the basis of an universal confidence in life insurance which has directly stimulated the virtues of thrift and self-denial. The unexpected savings to these life insurance companies by a rate of death loss less than had been expected when they made their contracts years ago, constantly falling, has enlarged their resources and created a confidence in these companies, along with the lengthening record of able and trustworthy management, until our people have contracted with these private companies a total of seventy-three billion dollars of life insurance. In half the span of time which we celebrate tonight, the thrift investment of our people in this after-death protection has risen from ten billion to seventy-three billion dollars. Here are private contracts many times the aggregate of all the allied debts and reparations, which through four months of negotiation for their final plan of settlement has fixed the attention of the world, although these debts and reparations rest primarily upon the entire national wealth of several great peoples. Besides these life insurance contracts which are based on the impulse of saving and the affectionate care of those who survive us, marches also the record of extraordinary growth in savings accounts. These are the indicators that dissipate any reasonable fear that easier living conditions will undermine the sturdy virtues of thrift and self-denial and affection and lead only to extravagance and thoughtless waste.

Could you imagine an Edison under any conditions of modern living that would not devote his restless intellectual energy to the study of natural laws and the perfection of inventions of human service? And there are many coming Edisons of smaller stature.

Can you imagine a field of inspirational appeal that can exceed the field of modern business, ranging through invention, research and organization, when that business is conducted with high ideals as well as high standards of business efficiency?

The New Freedom

Is our civilization highly mechanized, or are we beginning for the first time in history to put a proper premium on the superiority of mind over muscle? When we equip office and workshop with invention and power that shorten the working day, has modern industry only contributed an opportunity for profitless idleness or worse? When electrical servants in the home free the afternoon of its ancient tasks, has industry done nothing more than swell the motion-picture audience or added to the window shoppers of our avenues? There is no chorus from the emancipated homes of America that the home is being mechanized, destroying the craftsmanship of former times. There is no insistence from the women of America that we return to the domestic era of the washtub, the stifling range, and the dusty broom. Twenty million American homes connected for electricity evidence no inappeasable aspiration for the days of the kerosene lamp. American homes pay for kilowatt hours, but they buy light, warmth, coolness, relief from drudgery.

So also, 500,000 farms, now connected with electric light and energy, are developing a new definition for the farm unit—a departure from the traditional farmstead, but a farm in which the energy of the factory will be applied to the lightening of farm drudgery as well. Modern industry and particularly the power industry has presented to all of us the priceless gift of leisure hours. Industry does not need to assume the personal responsibility for the use of those precious moments of opportunity. That responsibility rests on the individual. If we believe in democracy at all, if we trust human character, at all, we must profoundly believe that through error and misdirection man will nevertheless learn to use this new freedom wisely.

The Basis of Social Advancement

With profound truth, Herbert Hoover said in 1924, before the World Power Conference:

"The factor that has been primarily responsible for the tremendous changes of the last century and without which modern civilization could not exist is mechanical power. The form in which in increasing degree such power is being applied is electrical energy—the greatest tool that has ever come into the hands of man. The degree to which we utilize this tool as a substitute for manual labor will largely determine the rate of our industrial and social progress. To reduce human labor, to increase its productivity, is the most profound basis of social advancement."

Within the past past month the Committee on Recent Economic Changes, under the chairmanship also of Herbert Hoover, recounts the progress of the five intervening years. This report speaks of the rise in the use of power, three and three-quarters times faster than the growth in population. It emphasizes its increasing flexibility which enables it to penetrate every section of the United States, including rural areas. It speaks of the silent revolution by which through power the unskilled worker has become a skilled operator, multiplying his effectiveness. The survey states that, as a nation we now use as much electrical energy as all the rest of the world combined.

Inevitably we must analyze for ourselves the causes which lie behind preeminence in national progress. There is, then, not disparagement, but inspiration, for ourselves and others, when we find cause and effect securely jointed.

For example, the sixty million horsepower today in America is possible because today 75 per cent of America's factories are electrified, while in Great Britain only 48 per cent are electrified. With that we find that the relative national wealth of the United States and Great Britain runs in exact ratio of the horsepower per capita used in industry, namely 4½ to 1. With that, again, we find as between the United States and Great Britain we have twice as many owned homes, and one-twentieth as many people per capita on public charity.

Distribution of Wealth

The indicators by which our national income rises in throbbing growth until it approaches an annual one hundred billion dollars of new production, show that American industry, with its power service, increases the volume of things to divide among the homes of America. The evidence in America of equable distribution of these earnings under our political and social system rests on such indicators as its twenty-five million automobiles and its nineteen million telephones. Distinctly, the average of human security is steadily advancing. The congested quarters of our cities today show the universal possession of good shoes and stockings by the children of the tenements. The wage-earner of America today may reasonably aspire to own his flivver and a savings account. The working girl of America has established the standard of silk as the proper garb for self-supporting womanhood. The poorhouse is today echoing fewer footsteps within its sparsely tenanted halls.

History will rate America's most significant gift to civilization as its genius for revolutionary organization of industry. America's title of honor in history will rest upon the rise of average welfare under the earnings of highly organized and power-driven industry, and of a social system which distributes and shares those earnings fairly.

But then, industry must not rest content with the progress which has been made. As long as there are still in the world men and women and children who would be happier if there were brought within their reach more and better food, more and better clothing, and until security of employment and earning power enables them to live in better homes, there is a responsibility and inspiration in this power industry which is the direct servant of all industry. All human history has accepted the concept of poverty as unavoidable. "The poor ye have with you always," has scriptural authority. Under the favor of Providence, America may reasonably hope, in the not distant future, it will have shown that poverty—except as result of individual and exceptional misfortune—may be recorded as a vanquished evil. When that day comes, it will rest upon the economic law established by modern industry, directed by brains, driven by power, administered with high intelligence and high ideals. There is a peculiar responsibility resting on this electrical industry. It asks from public regulation, fair and generous treatment and understanding, and it should make sure that its own ethics and standards shall be above reproach. Its record of business enterprise and resourcefulness has invested it with peculiar distinction. It must maintain itself in public confidence by standards and practices that challenge the closest scrutiny. Possessed of the business enterprise which it has shown, and conducting itself so as to enlist the public confidence which it should possess, there stretches before it a limitless future, measured both in business opportunity and the satisfaction of social service.

When Thomas Edison forty-nine years ago established his Pearl Street lighting station in New York City, with 750 h.p. and fifty-nine customers, could he have possibly visualized the 2,100,000 h.p. generated in New York today? When as meter reader and bill collector he answered a complaint of overcharge at 23 Wall Street and convinced the Senior J. P. Morgan of the correctness of his lighting bill, could he have visualized the start of an industry that would dominate all industries?

A Challenge and an Inspiration

But at any scale of industry development, large or small, the qualities of intellectual stature, or earnestness of purpose, of simple sincerity, are the qualities which make his name inseparably connected with this new giant. They are the qualities which this industry may well pray will always mark its leadership. We properly celebrate tonight the Golden Jubilee of an epoch-making invention, and properly invest it with the character of a testimonial to private character and ability of which all America is proud. The history of this individual, and the history of all industry which has developed on the basis of his successive inventions, should give inspiration to American Youth. I said earlier tonight, and I repeat, that the one deathless force in human life—a force from which human progress must inevitably continue to develop—is the power of the human intellect. I recall again a striking assertion of Mr. Kettering in which he states that "Whatever is within the range of the human mind to imagine, that thing can be done."

That note is a challenge and an inspiration, even as it is a characteristic of this industry and the individual whom we are honoring.

CHAIRMAN FREEMAN: I am instructed to announce that those who wish to round out the evening with dancing, will have the privilege of doing so as soon as the floor can be cleared of the seats, and to encourage your cooperation in that regard, a special lighting exhibition will be put on immediately in the exhibition hall. It can be seen to advantage from the gallery which can be reached to my left. Announcement will be made in the exhibition hall as to when this hall will be prepared for dancing.

We thank you, and adjourn this meeting.

[The meeting adjourned at 11.30 p.m.]

LAMP COMMITTEE

Lamp Sales

During 1928 a total of 312,000,000 large tungsten filament lamps were sold in the United States. This is the greatest number of lamps ever sold in any one year and is an increase of 2.3 per cent over the previous year as compared with 3.7 per cent increase of 1927 over 1926.

In addition, 9,900,000 large carbon lamps were sold in 1928, as compared with 12,600,000 sold in 1927, a decrease of 21.4 per cent. The majority of these carbon lamps (77 per cent) were imported. The total sales of large carbon lamps during the past three years have decreased, due to the decrease in importations, the sales of domestic-made large carbon lamps having remained about constant. Most of these imported carbon lamps have been sold through chain stores, which are now selling tungsten filament lamps in greatly increasing quantities.

The sales of miniature lamps, such as those used in flashlights, automobiles and Christmas trees, are not included in the figures above given. The sales for these types of lamps during the past three years have been as follows:

Tungsten Filament Miniature Lamp Sales

	1926	1927	1928
Flashlight	32,700,000	37,380,000	42,880,000
Automobile	116,300,000	116,500,000	132,040,000
Christmas tree	34,350,000	44,350,000	45,245,000
Miscellaneous	4,990,000	6,900,000	8,205,000
Total	188,340,000	205,130,000	228,370,000

Carbon Filament Miniature Lamp Sales

	1926	1927	1928
Christmas tree	12,680,000	13,415,000	25,650,000
Miscellaneous	1,030,000	1,050,000	915,000
Total	13,710,000	14,465,000	26,565,000

Christmas tree lamps are generally supplied with current from central station service. Those that burn eight in series on 115-volt service consume about 5 watts each, a string of eight lamps being about the equivalent of one 40-watt lamp. Of the tungsten filament Christmas tree lamps sold in 1928, about 3,300,000 were of the new 10-watt 115-volt type, so that the 1928 sales of all tungsten and carbon filament Christmas tree lamps were the equivalent of about 9,000,000 40-watt lamps.

Fig. 1 graphically shows the number of large (excluding miniature) lamps sold each year beginning with 1907. It also gives the aggregate lumens of the lamps sold, showing that a much greater amount of light was used than the number of lamps sold would indicate.

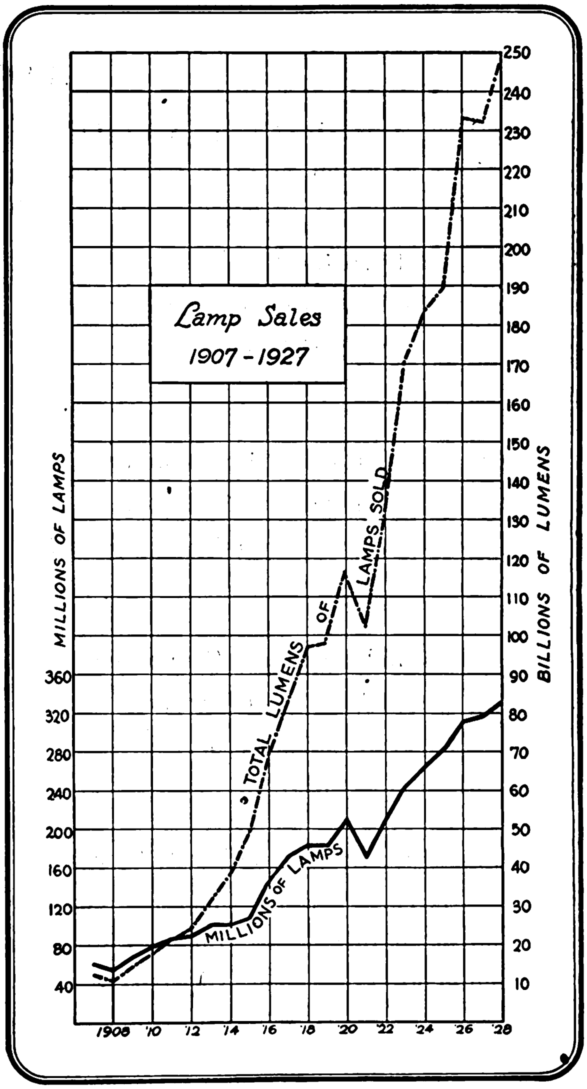

FIG. 1—Number and Aggregate Light Output of Lamps Sold (Excluding Miniature Lamps).

Average Lumens, Watts and Efficiency of Lamps

Table I presents the average lumens, watts and efficiency (lumens per watt) of large lamps sold during the past three years. Similar data for each year, beginning with 1907, are shown graphically in Fig. 2.

Distribution by Voltage

Table II presents the relative demand for lamps during the past three years, divided into voltage groups.

Standard Voltages

Table III shows the distribution of lamp sales classified by voltage groups within the 100-130-volt range (generally called the 115-volt group) for the past three years. These data are also shown graphically in Fig. 3.

Publication No. 289-67, Serial Report, Lamp Committee.

TABLE I.

AVERAGE LUMENS, WATTS AND EFFICIENCY OF LAMPS SOLD (EXCLUDING MINIATURE LAMPS)

	1926	1927	1928
Average lumens...............	747	732	769
Average watts................	59.6	59.0	60.2
Average lumens per watt.......	12.5	12.4	12.8

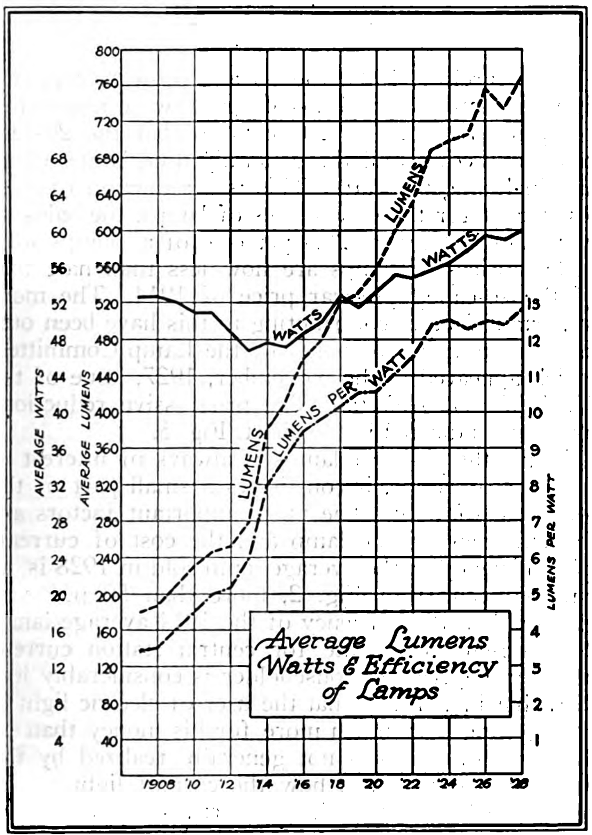

FIG. 2—AVERAGE LUMENS, WATTS AND EFFICIENCY OF LAMPS SOLD (EXCLUDING MINIATURE LAMPS).

TABLE II

DEMAND BY VOLTAGE GROUPS

	1926	1927	1928
115 volt group................	89.6%	89.9%	90.7%
230 volt group................	3.3	3.2	2.9
Street series group...........	1.7	1.6	1.5
Street railway group..........	1.5	1.4	1.5
30 and 60 volt groups.........	3.1	3.1	2.6
Miscellaneous.................	0.8	0.8	0.8
Total......................	100.0%	100.0%	100.0%

It will be noted that the sales of 110-volt lamps decreased slightly in 1928 from the previous year. In earlier years 110 volts was the principal voltage, but it is now yielding gradually to the higher voltages. The 115-volt lamp demand decreased slightly last year, the 120-volt demand being the only one which showed an increase.

Demand by Sizes

Table IV shows the relative demand for the more important sizes of lamps during the past three years.

TABLE III

DISTRIBUTION OF LAMPS BY VOLTAGE WITHIN THE 100-130 VOLT RANGE

	1926	1927	1928
100-109 volts.................	0.1%	0.1%	0.1%
110 volts.....................	12.4	8.9	8.1

Street Series Lamps

The average light output of street series lamps sold in 1928 was 2422 lumens, an increase of 5.6 per cent over 1927. Fig. 4 graphically shows the average light output of street series lamps sold each year, beginning with 1907.

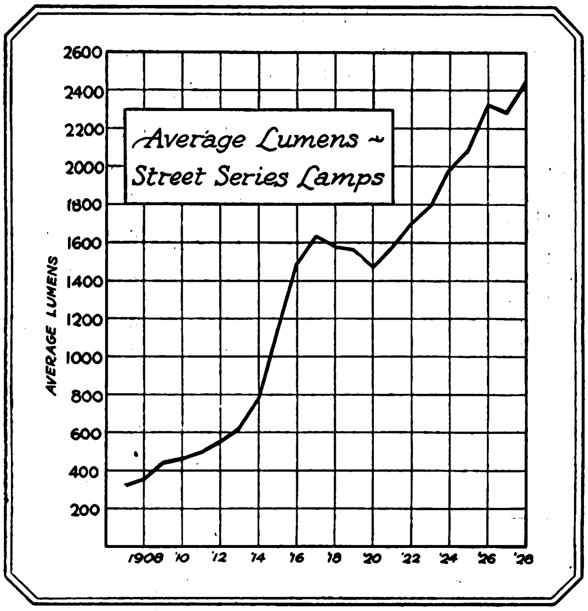

FIG. 4—AVERAGE LIGHT OUTPUT OF STREET SERIES LAMPS SOLD.

The relative demand for the different sizes and ampere ratings of street series lamps during the past three years is shown in Tables V and VI.

TABLE V

DEMAND FOR STREET SERIES LAMPS BY SIZE

	1926	1927	1928
Less than 600 lumens	2.6%	1.6%	1.3%
600 lumens	18.3	18.2	16.3
800 lumens	6.7	7.1	7.5
1000 lumens	30.0	30.0	29.2
2500 lumens	17.7	17.7	19.3
4000 lumens	12.7	12.3	12.5
6000 lumens	9.8	10.2	10.9
10000 lumens	2.2	2.0	2.2
Miscellaneous	....	0.9	0.8
Total	100.0%	100.0%	100.0%

Price Changes

Table VII presents the dates of introduction of the present sizes of the 115-volt group of Mazda lamps for general lighting service, their original list prices and the changes in prices that have occurred to date.

On July 1, 1928, a price reduction averaging 8.8 per cent was made. This was mentioned in the July, 1928, issue of the *N. E. L. A. Bulletin,* in an article contributed by the Lamp Committee.

TABLE VI

DEMAND FOR STREET SERIES LAMPS BY AMPERE RATING

	1926	1927	1928
4.0 amperes	3.0%	3.5%	2.7%
5.5 amperes	3.9	5.7	4.2
6.6 amperes	64.4	64.7	65.7
7.5 amperes	10.1	8.8	8.9
Compensator	18.4	16.6	17.7
Miscellaneous	0.2	0.7	0.8
Total	100.0%	100.0%	100.0%

On March 1, 1929, the 50 and 60-watt standard lighting lamps of the 115-volt group were reduced in list price from 22 to 20 cents so that the 20-cent price now covers all the generally used lamps up to and including 60 watts. This is a reduction of over 9 per cent for these two sizes of lamps, the sales of which, in 1928, were 28.4 per cent of all lamps sold.

The prices of lamps are now less than half that of the so-called pre-war price of 1914. The more important factors contributing to this have been outlined in an article prepared by the Lamp Committee, which appeared in the November, 1927, issue of the *N. E. L. A. Bulletin.* The progressive reductions made are indicated in the chart, Fig. 5.

While the price of lamps is always of interest to the user of lamps, it constitutes a small part of the total cost of light. The more important factors are the efficiency of the lamp and the cost of current. The efficiency of the average lamp sold in 1928 is, as will be seen from Fig. 2, more than 50 per cent greater than the efficiency of the 1914 average lamp. The present retail rate for central station current used by the average householder is considerably less than that in 1914, so that the user of electric light is now getting very much more for his money than he did in 1914. This is not generally realized by the user. Fig. 6 indicates how the cost of light to the retail user has decreased, the chart also showing how the cost of living has increased during this period.

Lamp Developments

75 Watt Inside Frosted Lamp

While there is still a relatively slight demand for the 75-watt lamp, the Mazda manufacturers are now supplying this lamp in the A-23 inside frosted bulb in place of the old PS-22 clear bulb. The list price of the lamp with the inside frosted bulb is 10 cents less than with the old clear bulb (35 cents as compared with 45 cents). It should be noted that the 100-watt lamp is obtainable at the same price and is made in the same bulb.

Projection Lamps

In last year's report mention was made of the 50, 100 and 200-watt 115-volt lamps fitted with the medium prefocus base. There are now also available 500 and 1000-watt lamps fitted with prefocus base (formerly fitted with screw base), the 500-watt lamp having a medium prefocus base and the 1000-watt

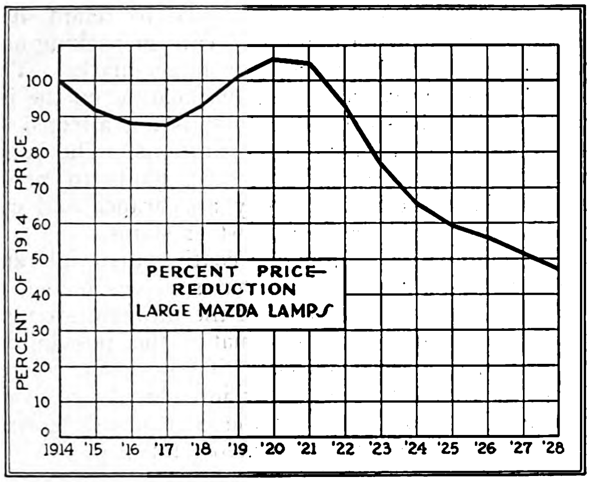

FIG. 5—REDUCTIONS IN PRICES OF MAZDA LAMPS SINCE 1914.

*New standard line of lamps.

having the new mogul prefocus base. The new mogul prefocus base is the same design (but larger dimensions) as the medium prefocus base.

Intermediate Screw Base

It is hoped that ultimately this base will supersede the candelabra base, but it is realized that there are large numbers of candelabra sockets used in fixtures throughout the United States. No concerted movement has yet started except that the regularly listed so-called "candelabra" lamps are available fitted with the intermediate screw base at the same price.

Short Bulb Street Series Lamps

The 15-ampere (4000 lumen) and 20-ampere (6000 and 10,000 lumen) lamps have, in the past, been supplied in longer bulbs than those of equivalent 6.6-ampere lamps. The 15-ampere lamp is now available in PS-35 (formerly PS-40) bulb and the 20-ampere lamps in a short PS-40 bulb, the prices of these shorter-bulb lamps being lower than the old larger-bulb lamps.

On these three shorter-bulb lamps the light center length has been changed from 9½ to 7 in. To use the shorter lamp requires, in most fixtures, a change in the socket position or the insertion of a 2½-in. socket extension piece screwing into the present socket. The use of the lower price shorter lamp well warrants the slight expense of changing the socket position or of using the extension piece.

The lamp manufacturers advise that the changeover to these new lamps is progressing more slowly than had been anticipated, so that at the present time both types of series lamps are in demand, and the cost per lamp, instead of being lower, is higher. The Lamp Committee, therefore, draws Member Companies' attention to the opportunity, by making a small expenditure for socket change, where this is involved, to materially reduce the renewal cost by using the new and less costly lamps. If Member Companies who have not already done so will fall in line with the general program, it will assist to hasten this simplification project.

An article, supplied by the Lamp Committee, describing this, appeared in the August, 1928, issue of the *N. E. L. A. Bulletin.*

56 Watt Inside Frost Street Railway Lamp

This lamp supersedes the 56-watt lamp in S-21 clear bulb. It has a special filament construction designed to withstand vibration on street cars and will supersede the corresponding size in the straight side clear bulb, for use five in series on 525 to 650-volt circuits.

Inside Coloring

A notable development was the introduction of the inside colored lamp to supersede the outside coated or sprayed finish type previously used. While bulbs of natural colored glass have been used to some extent, their relatively high price has limited their application.

The outside coated colored lamps were not entirely weatherproof under conditions of severe exposure, the colors tending to fade from the action of the elements. The mat surface tended to retain dust and soot and called for unusual care in packing and handling, to avoid scratches or finger-marks. The new process sprays a non-fading coating on the inside of the bulb so that the color is not affected by the weather nor by handling operations. The lamp, having a smooth outside surface, tends to retain its original smooth and glossy appearance and can readily be wiped free from dust or stains.

The elimination of outside coating materials and the foreign matter that the mat surfaces tended to retain has greatly safeguarded the ultimate strength of basing cement and eliminated the possibilities of stained or corroded bases. These inside colored lamps in the wattages so far introduced are available at the same prices as the corresponding sizes and colors of the outside coated lamps.

25 Watt, T-6½ Bulb, Intermediate Base Showcase Lamp

This lamp, illustrated in Fig. 7, made available during the past year, has an overall length of 5½ in. and is listed at 55 cents. The diameter of the lamp is about the same as the intermediate base socket which makes the lamp useful where space limitations prevail. It makes possible the design of extremely neat and compact showcase lighting equipment and has also been found effective for illuminating displays, models, etc., from beneath. It is also desirable for light ornaments of such proportions requiring a small extended light source.

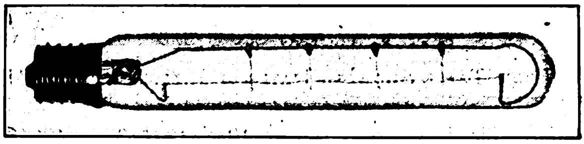

FIG. 7—25-WATT, INTERMEDIATE BASE SHOWCASE LAMP.

An article, calling this lamp to the attention of Member Companies, was published in the *N. E. L. A. Bulletin,* December, 1928.

Very Large Lamps

The most powerful incandescent lamp, so far constructed, consumes 50,000 watts and is illustrated in Fig. 8. Its tungsten ribbon filament requires about 450 amperes at 115 volts. The lamp is so designed that the heated gas in rising passes through a metal chamber equipped with radiating fins to cool the gas to a temperature which will permit the continued operation of the lamp. One feature of this lamp is the sealing of the bulb proper to the metal chamber. This is done with a series of glass rings, fused together, of graduated differences in temperature coefficient, the glass of the bulb having a considerably different expansion-temperature coefficient than that of the metal. The lamp is purely an experimental one.

Lamps in sizes up to 10 kw. are finding rapidly increasing use in lighting for the production of motion pictures and for airport floodlighting service. A novel means of improving the candlepower maintenance of these lamps is being introduced.

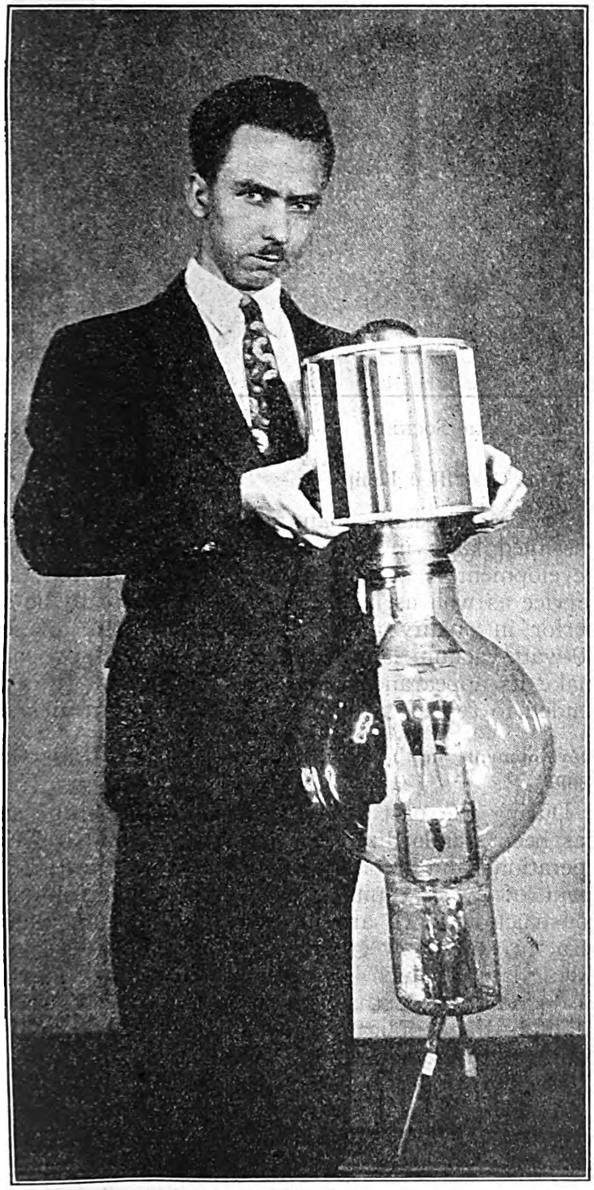

FIG. 8—50-Kw. Lamp, the Largest Incandescent Lamp Ever Made.

An Improvement in the Very High Wattage Lamps

The incandescent lamps used in airport and motion picture studio lighting are not only operated at very high efficiency, but their bulb surface per watt is much less than that of the smaller lamps so that their bulbs tend to blacken more rapidly. The 500-watt lamps for floodlighting service are made in bulbs 5 in. in diameter, while 10-in. bulbs are used for the 10,000-watt lamps for airport floodlight and motion picture studio lighting. The wattage is twenty times as great, but the bulb surface is only quadrupled, so that the watts per unit of bulb surface are five times as great in the 10-kw. lamp as in the 500-watt floodlighting lamp.

The tungsten slowly evaporated from the filament surface clings to the inside of the bulb as a black deposit, where it absorbs both light and heat radiation. Chemical means are employed to minimize this blackening, but on occasion it nevertheless becomes objectionable. The blackening reduces the light output and raises the bulb temperature. If the bulb temperature reaches the softening point of the glass, happily a rare occurrence, the bulb distorts and the lamp fails mechanically, but the light output is usually so reduced by absorption before that time that the lamp has but little remaining value. Fortunately, the deposit on the inside of the bulb does not always adhere strongly to the glass (unless the bulb has been allowed to become so black that it has softened or devitrified), so that the black deposit can normally be removed to a large extent by the proper kind of cleaner introduced in the bulb. This cleaner consists of about a teaspoonful of metallic tungsten powder, which is put inside of the bulb. When the blackening becomes noticeable, the lamp is taken out of its socket and turned about slowly, so that the tungsten powder slides around on the inner surface of the bulb "mopping up" the deposit as it goes along. The bulb can be restored in this way to approximately its original state, and the light output increased nearly to its initial value.

There is a slight decrease in light generated by the filament throughout life by reason of the changes which take place in it during burning, and, of course, this cannot be restored by cleaning the bulb. The cleaning intervals should ordinarily be shorter at first because as the lamp ages in service the tendency to blacken becomes somewhat less. It is expected that it will be found advisable to clean these lamps about four or five times during the course of their life.

Lamps for Sound Pictures

The introduction of sound with motion pictures necessitated the development of small lamps having high efficiency. These lamps have a horizontal coil

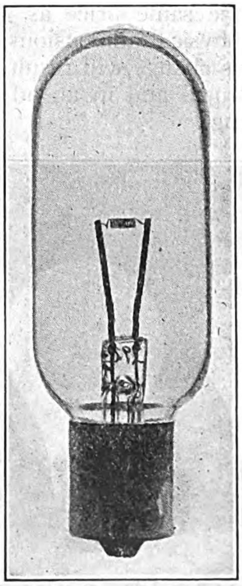

FIG. 9—Horizontal Coil Filament Lamp for Film Sound Recording.

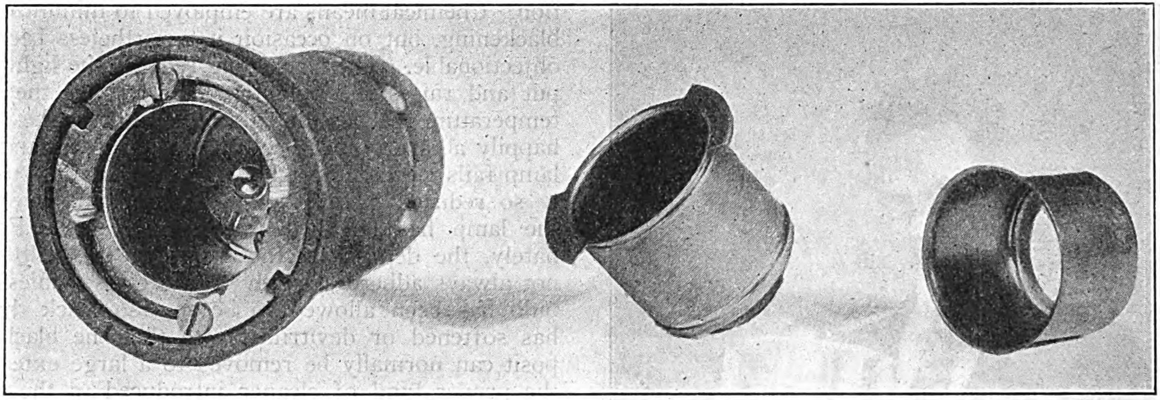

FIG. 10—MOGUL PREFOCUS BASE AND SOCKET.

filament for projecting the sound record on the film through a very small slit and on to the photo-electric cell. Flattened wire supports at each end of the filament are used to allow for expansion and contraction of the filament and to keep it from bowing.

Mogul Prefocus Base

The success of the medium prefocused base lamp and socket for use in projection equipment led to the production of a mogul prefocused socket and base, illustrated in Fig. 10. It can be utilized on any lamp regularly supplied with a mogul screw base and is now standard with the 1000-watt 115-volt T-20 bulb lamp for projection lighting service.

60 Watt A-21 Bulb Lamp

The lamp manufacturers have reduced the overall length of the 60-watt A-21 bulb lamp, illustrated in Fig. 11, making it exactly the same, in length as well as diameter, as the present 50-watt lamp. It is believed that with advancing standards of illumination, many customers who now use 50-watt lamps will be induced to replace them with 60-watt lamps and will be pleased to discover that the 60-watt lamp can be obtained at the same price as the 50-watt, and is identical in physical dimensions. It is, therefore, hoped that this change will result in a shift from 50- to 60-watt lamps, and in an advance in the standards of lighting.

40 Watt Gas-Filled Lamp

The Mazda lamp manufacturers have a 40-watt gas-filled lamp in process of development. If this development is as successful as is anticipated, and service as well as laboratory tests show it to be superior in quality and performance to the present 40-watt vacuum lamp, this new lamp will probably make its appearance some time this year. It is intended to replace the present 40-watt vacuum lamp.

Developments in the Usage of Submerged or Underwater Lamps

During the past year the 1000-watt diving lamp has been standardized for naval rescue and diving operations, and becomes part of the permanent equipment of every capital ship. Civil operations and construction work around piers, docks and marine structures are now greatly facilitated by these same diving lamps, which burn submerged and are capable of operation at depths as great as 300 ft.

Interesting applications of underwater lamps are recorded to include observations and studies of fish and marine organisms, such as reported by Dr. William Beebe and the recent expeditions of the American Museum of Natural History. It is reported that submerged lights attract and lure many specimens to the surface, while in certain localities underwater burning lamps are now used in lieu of bait. In

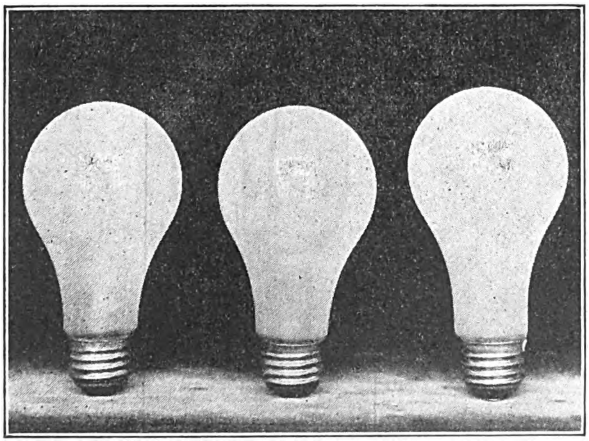

FIG. 11—PRESENT 50-WATT, NEW AND OLD 60-WATT LAMPS.

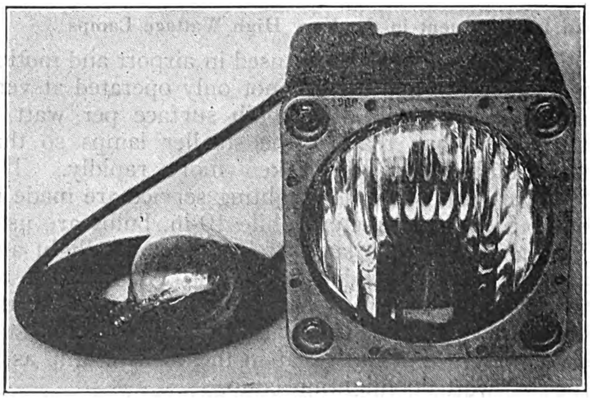

FIG. 12—LIGHTING UNITS OF WATER-TIGHT CONSTRUCTION FOR THE UNDERWATER ILLUMINATION OF SWIMMING POOLS AND FOUNTAINS.

connection with fish hatcheries lamps suspended directly above the water surface attract moths and insects on which the fish feed.

Recent studies of the transmission of light through liquids suggest commercial applications of submerged lamps, not only for the decorative lighting of fountains and streams, but as well for the inspection of oils, liquid soaps, acids and similar fluids.

The underwater lighting of both indoor and outdoor swimming pools and the development of practical units therefor opens quite a large field of application, inasmuch as pools so lighted, consuming perhaps 5 to 10 kw., are quite beautiful and are—to a large extent—free from the probability of drowning accidents or pollution.

Use of Lamps of Proper Voltage

In its report of a year ago your Committee called attention to the cases, all too frequently encountered, in which lamp dealers supply lamps whose rated voltage differs from the announced standard of service of the utility.

The following is quoted from last year's report:

"In cases where dealers are supplying lamps of too high a voltage the cause is generally either the stress of commercial competition, or failure fully to realize the detriment resulting to all parties through that practice, or failure of a wholesaler to supply lamps of correct voltage.

"The class of lighting customers who suffer most by this practice are, in general, the small customers, particularly residence users, who take, without question as to voltage, the lamps offered by the retail dealers.

"Since the lighting voltage in the larger cities of the country is generally either 115 or 120 volts as contrasted with a lighting voltage of 110 or 115 in many of the smaller communities, it is generally found that where a dealer draws his lamp supply from a larger city the lamps, if they are not of the correct voltage, are more likely to be of a voltage higher than the correct voltage, rather than to be lower than the correct voltage. Thus, in general, we find that, when a lamp is not of the proper voltage, it is generally of too high a voltage.

"The disadvantages, which are well known to the companies but not generally known by the consumers, resulting from operation of lamps of too high a voltage, are:

1. The customer receives less light, and at a greater cost per unit of light.
2. The central station loses kilowatt-hour sales due to the decrease in wattage consumption of the lamps.
3. The manufacturer and dealer lose lamp renewal sales.

"It is, therefore, to the best interest of all parties concerned that only lamps of proper voltage be used. A realization on the part of the dealer of the harm resulting from using lamps of improper voltage will almost invariably result in a change to the proper voltage."

Further study and investigation of this subject shows that in the great majority of cases in which

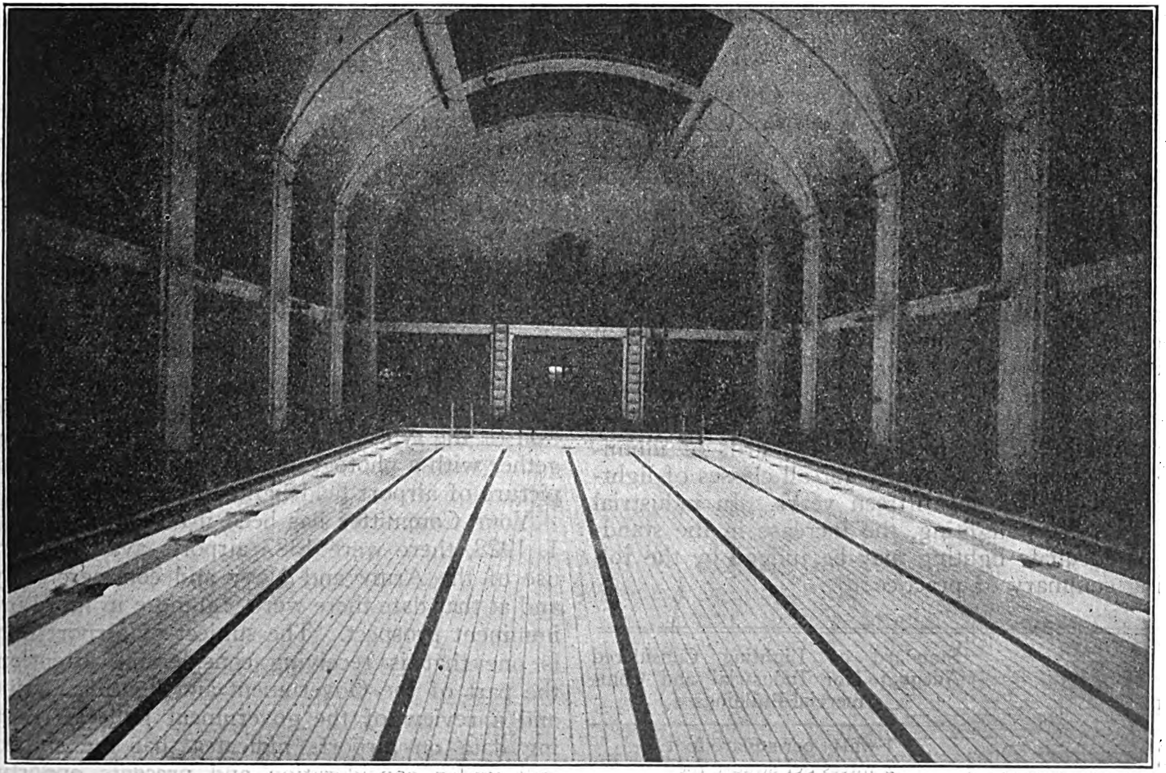

FIG. 13—VIEW OF A SWIMMING POOL LIGHTED FROM BENEATH THE SURFACE

lamps of too high a voltage are supplied, the cause is inadequate or erroneous information, on the part of the user or the distributor, as to the average voltage delivered at the lamp sockets. Lack of knowledge arises either from ignorance or from carelessness, and the remedy is obvious. Erroneous information generally results from improper measurement of voltage, or improper interpretation of voltage readings taken on the customers' premises. For example:—It is a growing practice to regulate the voltage delivered to customers' premises at a value slightly in excess of the system standard in order to allow for voltage drop on customers' wiring. If, perchance, on a system operated with a 115-volt standard, a voltage reading of 117 or 118 volts should be obtained at a lamp socket at a time when there is little or no lighting load in use, or if such a reading were obtained at the service entrance under any condition of load, such indication might be taken as a basis for concluding that the service voltage is too high for the use of 115-volt lamps, and might therefore lead to the recommendation and use of 120-volt lamps; when, as a matter of fact, the voltage drop due to load consumes the excess voltage shown by the reading and there is, therefore, no justification at all for the customer ordering lamps of high labeled voltage. If it is made known to all lamp dealers that the utility will take voltage measurements to check its service in locations where a question has been raised as to the voltage supplied, there will then be no occasion for voltage measurements by people who do not understand the matter, and these cases of improper interpretation will automatically cease.

Some cases of the use of improper lamp voltage result from attempts to compensate for the mechanical rigors of the service by using higher voltage lamps—when the only effective remedy would be to use either the rough service lamp or the vibration resisting lamp or some kind of shock-absorbing socket or lamp mounting. An occasional case of under-voltage operation is found to be due to misdirected effort to economize on the part of the customer, whereby he deliberately orders lamps of higher voltage to save renewal expense, forgetting—or not knowing—that the loss in lamp efficiency which accompanies the increase in lamp life will adversely affect the entire light output of the installation to such an extent as to entirely outweigh the small saving in lamp cost.

It must be remembered that standards of illumination have increased greatly for all classes of lighting service in the last fifteen years. In industrial and commercial lighting, the increase in the standard of adequate lighting may be judged by the following summary of practice:

Year	Standard of Lighting Considered Adequate for Industrial and Commercial Buildings
1913	1 watt per square foot
1920	2 watts per square foot
1929	3 watts per square foot

If the increases in illumination are obtained by increasing lamp wattage without providing additional capacity in the lines supplying the current, the added voltage drop may contribute materially to under-voltage burning of the lamps.

It was hoped that the Voltage Book distributed a year ago would rectify the cases of improper lamp voltage. There has been some improvement, but much still remains to be done. Plans are, therefore, being made for a cooperative effort on the part of the central stations and lamp manufacturers having for an object the discovery and elimination of these remaining conditions of under-voltage burning. This effort will probably develop into a series of meetings, or "voltage conferences," in the larger centers, between the utility and the lamp manufacturers' representatives, following which the latter, having definite information as to the average voltage supplied at the lamp sockets, will correct such cases as may be found in which dealers are not supplying lamps of the correct voltage.

Two cities (of 100,000 population or thereabouts) have already been covered in this manner, with very satisfactory results. In the first one, the operating standard was 110 volts, and as all the larger lamp dealers had to carry 115-volt lamps for all the surrounding territory, they simplified their stocks by supplying 115-volt lamps in their home city also. The corrective measure in this case was the decision of the utility to postpone no longer its change from 110-volt supply to the much more universal standard of 115-volt supply. In the second city a few complaints of high voltage led to voltage tests, which did indicate in certain localities a higher than normal operating voltage. In some districts in this same city prevailing voltages were somewhat below normal. While, in general, the normal voltage was approximated in service, yet the reports of the few higher than normal voltages mentioned above gave rise to misconception and to the use of lamps of too high voltage. The result of the investigation was to establish the nominal operating voltage as the correct voltage for lamp supply.

Airport Lighting

Your Committee has been following with a great deal of interest the subject of airport lighting, and presented in its report last year a general description of the types of lamps used for this service, together with a photograph of a landing floodlight and picture of airport field lighted by floodlight.

Your Committee has been informed that on Oct. 1, 1928, there were 1387 airports available for the use of the Army and Navy and commercial flyers, and at that date there were 900 more in more or less imminent prospect. The subject of airport lighting is one that is receiving considerable attention on the part of the Government and lighting engineers, and a review of the government bulletins containing data on airports indicates that the subject is still under consideration and presents opportunity for considerable study and research.

In several cities special markings and signs for the aid and safety of aviation are being placed on conspicuous large objects, such as gas holders, railway stations, tops of hotels, etc. These aeronautical lighthouses serve a valuable purpose and will undoubtedly increase as aviation becomes more popular.

The Assistant Secretary of War and the Director of the Aeronautics Department of Commerce have both suggested that the utility companies might further cooperate by marking the roofs of their buildings, gas holders and other structures, with the name of the town and with directional arrows pointing to the nearest airport. They point out that the smaller the town, the greater value these markers will have. Specifications for such markings can be secured from the Director of Aeronautics of the Department of Commerce. The Aeronautic Branch of the Department of Commerce has issued Aeronautics Bulletin No. 16 entitled "Airport Rating Regulations," which bulletin contains specifications of rating on night lighting equipment.

At the International Civil Aeronautical Conference recently held in Washington, the fact was emphasized and has since been subscribed to by all air transport companies that commercially feasible air transportation necessitated night flying and safe night landing. Since the last Committee Report the transcontinental air way has been equipped with 1000-watt airway beacons over the last remaining section west of Salt Lake City, and thousands of miles of other routes have been similarly marked. The Department of Commerce specifies that a pair of directional beacons be added to the rotating route beacon, and these direction lights provided either with a distinguishing color, or to flash a dot and dash code. Privately owned rotating beacons must be equipped with a fixed projector pointing in the direction of the nearest airport. These developments greatly expand the consumption of lamps and lighting power and will, undoubtedly, have a beneficial effect in extending central station lines in rural communities.

In order to provide flexibility of airport landing field illumination, there have been recommended a plurality of individual projector units, usually arranged in banks or groups of three to ten, remotely controlled and operated in accordance with the wind direction. Such an arrangement insures against trouble from individual outages and extends the areas floodlighted. A typical modern airport has a connected load of twenty-four 3-kw. lamps, in addition to the boundary and marker lights and hangar floodlighting. Illuminated wind Tees are also coming into usage, so that each major airport now represents a connected load on the order of 100 kw.

Red obstacle lights placed on every prominent structure near an air terminal make up a considerable addition to the field lighting itself.

Two new lamps have been developed for the airport floodlighting projectors designed to operate on voltage transformers at the units. These are the 1½- and 3-kw., 32-volt prong base lamps.

Lighting Demonstrations

On May 30, 1929, there was opened in Grand Central Palace, New York City, under the auspices of the Westinghouse Lamp Company, another permanent institute for the advancement of the art of modern lighting. With the creation of this lighting institute, there is brought to the central station companies and others interested in the promotion of better lighting the third important demonstration of this kind in this country. The Lamp Committee presented to the Association at the 1920 Convention at Pasadena a lighting demonstration patterned after the first demonstration of its kind, made at Nela

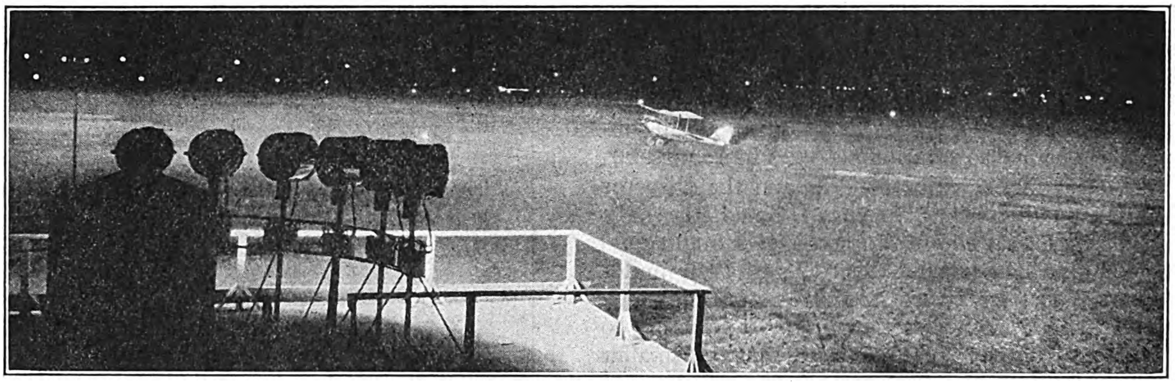

FIG. 15—VIEW OF ILLUMINATED RUNWAYS ON A LIGHTED AIRPORT.

Park by the National Lamp Works of the General Electric Company in 1919, from which demonstrations have been developed throughout the entire world. The Committee in its 1924-25 report, presented at the convention in San Francisco, described the Edison Lighting Institute opened to the public Feb. 12, 1925, by the General Electric Company at the Edison Lamp Works, Harrison, N. J.

The mark of differentiation of these institutes of applied lighting from that of an ordinary exhibit is that they are permanent institutions, which will be ever-changing demonstrations of modern practices of artificial illumination. They are permanent experimental laboratories open to scientists, engineers, architects, designers and all others of every branch of industry seeking the solution of lighting problems.

The industrial engineer may present his plans for the erection of a manufacturing plant, receive advice, and check his own lighting specifications, verifying his calculations by actual measurement and observation. Here the architect may study and visualize through scaled models the floodlighting of prospective buildings and monuments. They are a meeting place for students of technical schools and colleges, lighting engineers from the public utilities, designers of lighting fixtures, editors of technical and business magazines, merchandising managers of central stations, and dealers in lamps and equipment, each to inspect, study or have demonstrated to him, according to his individual interest, any of a thousand applications of lighting, whether it be in the home, the commercial or the industrial field.

The Westinghouse Lighting Institute occupies the seventh floor of the Grand Central Palace, an entire city block of 40,000 sq. ft.

Artificial light produced by electricity has become so commonplace in its fifty years that it is accepted with hardly a thought of its existence. This complete acceptance has been largely the result of a standardization in lamp manufacture that, in a sense, has stultified the development of application methods. The electric lamp is used for what are considered satisfactory results without an adequate appreciation of what would be possible if greater knowledge existed in the application of light.

It is this theory of application that makes the Nela

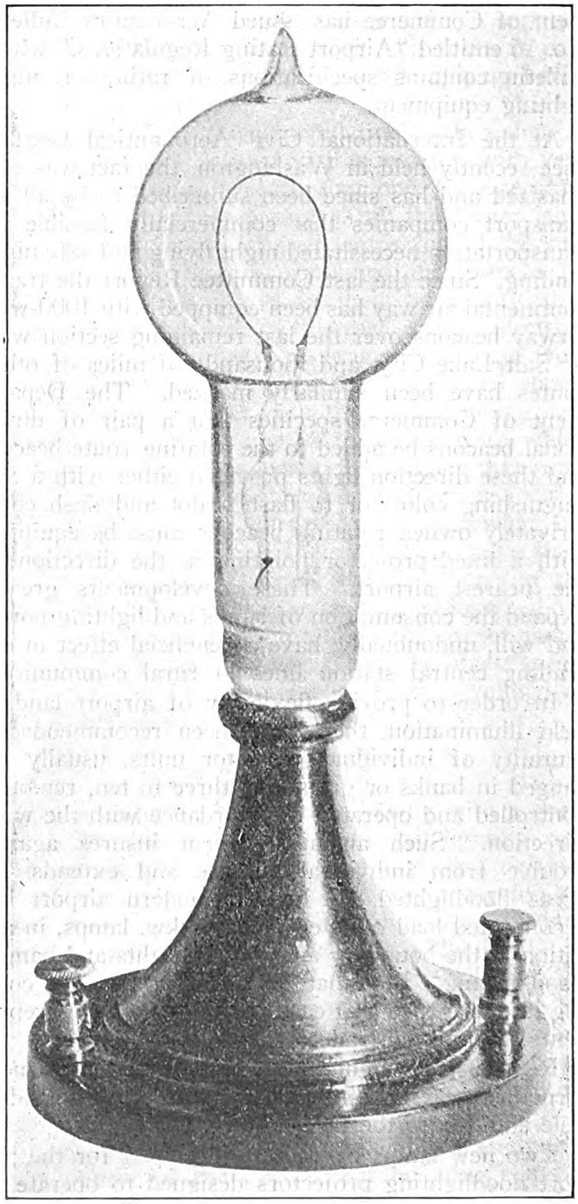

FIG. 16—REPLICA OF EDISON'S EXPERIMENTAL LAMP OF OCT. 21, 1879 (THE ORIGINAL WAS DESTROYED).

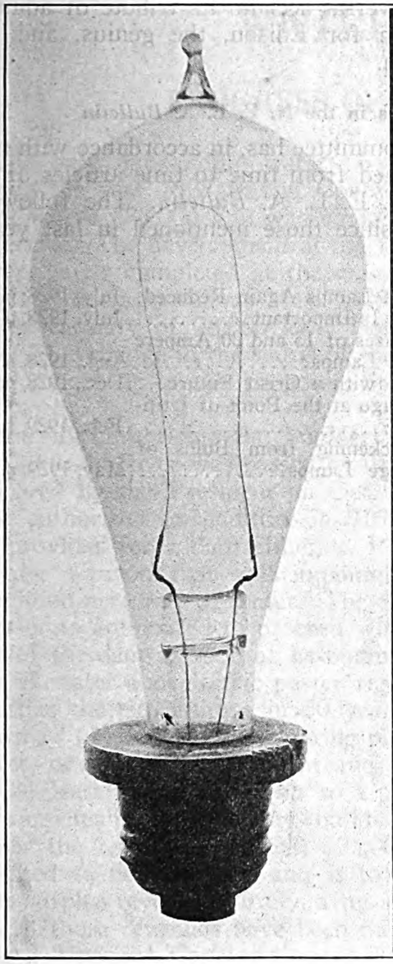

FIG. 17—THE FIRST COMMERCIAL LAMP, 1881.

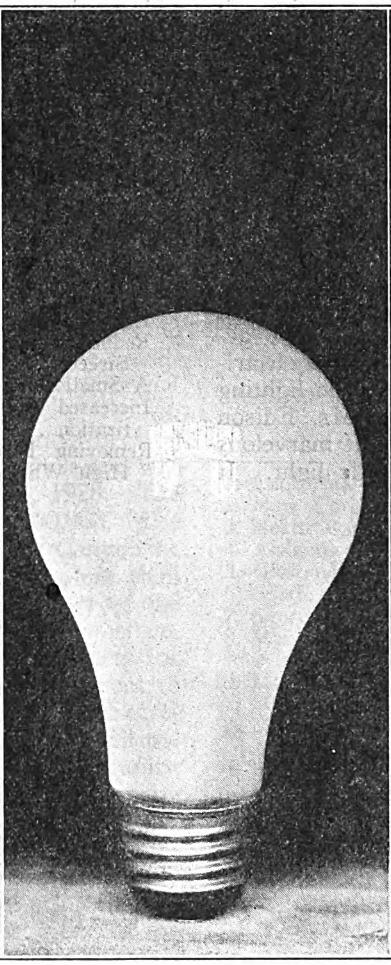

FIG. 18—PRESENT DAY 60-WATT LAMP.

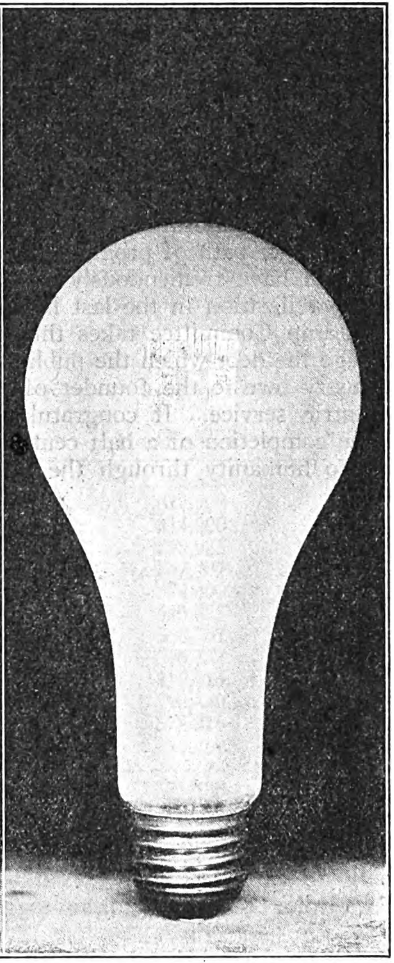

FIG. 19—PRESENT DAY 100-WATT LAMP.

School of Lighting, the Edison Lighting Institute, and the new demonstration opened by the Westinghouse Lamp Company in May of this year, unique in the history of applied lighting. All three of these large scale permanent institutes are open to the public and are free to all visitors.

The Lamp Committee is following with interest the success of such demonstrations for promoting the art and practice of better lighting. Institutes of this kind should certainly have a marked influence, not only in raising lighting standards, but also in encouraging the tendency toward the use of proper light intensities for industrial, commercial and home lighting purposes, through demonstrations of their utilitarian value in each field of their application.

Fiftieth Anniversary of the Incandescent Lamp

Oct. 21 of this year marks the fiftieth "birthday" of the incandescent lamp of Thomas A. Edison, who developed not only the first practical lamp, but a completely new system of generation and distribution of electric current for the lamp.

Much has and more will appear in the press and literature of the day regarding these remarkable inventions and the development of the industry. Fig. 16 illustrates a replica of Edison's experimental lamp of Oct. 21, 1879, and Fig. 17, 18 and 19 show the differences between the first commercial lamp sold and the present equivalent lamps.

The first commercial lamp, shown in Fig. 17, consumed about 100 watts and was rated to give 16 c.p. horizontally, equivalent to about 170 lumens. It blackened considerably during its life, the average amount of light throughout life being about 65 per cent of initial. It sold for $1.25 and was a marvel of the age.

The lamp shown in Fig. 18 is about the average size now used. It is rated at 690 lumens, its average lumens throughout life being 93 per cent of initial. It thus gives over five times the amount of light given by the lamp of 1881 and consumes about 40 per cent less current. Its list price is 20c., less than one-sixth that of the 1881 lamp.

Consuming about the same wattage as the first commercial lamp, the lamp illustrated in Fig. 19 is rated at 1340 lumens, its average lumens throughout life being 92 per cent of initial. It thus gives an average throughout life of over eleven times the amount of light given by the lamp of 1881. Its list price is 35c., less than one-third the 1881 lamp.

Mr. Edison, who is perhaps best known through his development of the incandescent lamp, although this is only one of his vast number of wonderful achievements, was presented, on Saturday night, Oct. 20, 1928, with the Congressional Medal, the highest honor the Government pays to any citizen. This event is well remembered by everyone. The resolution of Congress aptly stated that the Medal was bestowed in commemoration of his achievements in illuminating the path of progress through his inventions which have tremendously accelerated the advance of civilization in the last half century.

The Lamp Committee takes this occasion to acknowledge the debt which the public and the electrical industry owe to the founder of electric lighting and electric service. It congratulates Mr. Edison upon the completion of a half century of marvelous service to humanity through the electric light. It adds to the universal acclaim its tribute of admiration and esteem for Edison, the genius, and for Edison, the man.

Articles in the N. E. L. A. *Bulletin*

The Lamp Committee has, in accordance with past practice, published from time to time articles of interest in the N. E. L. A. *Bulletin*. The following have appeared since those mentioned in last year's report:

Price of Mazda Lamps Again Reduced	July, 1928, p. 400
Home Lighting Is Important	July, 1928, p. 439
Reduction in Sizes of 15 and 20 Ampere Street Series Lamps	Aug., 1928, p. 492
A Small Lamp with a Great Future	Dec., 1928, p. 750
Increased Voltage at the Point of Utilitization	Feb., 1929, p. 108
Removing Blackening from Bulbs of High Wattage Lamps	May, 1929, p. 309

WATER POWER DEVELOPMENT

PROGRESS OF WATER POWER DEVELOPMENT IN 1928

The only outstanding water power development during the year 1928 was at Conowingo, in Maryland, where 378,000 h.p. was completed and placed in service. The development at the falls of the Ohio River, partly completed at the close of 1927, came into full operation about May 1, 1928, with an installed capacity of 78,000 kw. There has been no observable change in the status of the Muscle Shoals development or in the proposed St. Lawrence development.

The bill authorizing the Boulder Dam project on the Colorado River was passed by Congress and was approved by the President on Dec. 21, 1928. The total authorized expenditure is $165,000,000. The bill provides for a dam either at Black Canyon or Boulder Canyon that will impound not less than 20 million acre feet of water. The Secretary of the Interior is authorized to proceed with the construction of the dam as soon as he obtains contracts for sale of water and electric power rights sufficient to amortize the expenditure in 50 years. The Secretary may (1) build the generating plant and sell the power, or (2) build the plant and lease the units, or (3) lease the power rights to a private company or municipality which may build its own plant. Under the terms of the bill, $25,000,000 is to be allocated to flood control and is to be repaid only from surplus revenues, if any, after all prior charges against those revenues have been met. The cost of the All-American Canal, estimated at $38,500,000, is to be a charge upon the land benefited by it, and is not to be paid for from the revenues derived from the sale of water or power rights from the dam. The act becomes effective within six months if ratified by the seven Colorado Basin States, or after six months on ratification by six of those States.

U. S. Geological Survey

The U. S. Geological Survey reports that on Jan. 1, 1929, the developed water power in the United States amounted to 13,571,530 h.p. The increase in the last year was 1,275,530 h.p. or 10.4 per cent. The largest item in this increase was the Conowingo development of the Philadelphia Electric Company which comprised about 30 per cent of the increase. The figures for recent years are as follows:

Date	Horsepower	Increase Per cent
1921, November	7,926,958	
1924, March	9,086,958	14.6 (2.3 yr.)
1925, March	10,037,655	10.5
1926, Jan. 1	11,176,596	11.3 (.8 yr.)
1927, Jan. 1	11,720,938	4.9
1928, Jan. 1	12,296,000	4.9
1929, Jan. 1	13,571,530	10.4

The average annual increase was 8.1 per cent.

The 13,571,530-h.p. hydraulic electric power existing on Jan. 1, 1929, is divided between 3375 plants, of which 1605 are public utility plants with capacity of 11,886,336 h.p. (8,867,229 kw.) and 1770 miscellaneous industrial plants with capacity of 1,685,194 h.p. The public utility plants average 7406 h.p. each and the industrial plants 952 h.p. each.

The distribution among the States is as follows:

State	Horsepower	Per cent of U. S. Total
1. California	2,226,529	16.4
2. New York	1,813,500	13.3
3. North Carolina	814,000	6.0
4. Alabama	799,085	5.9
5. Washington	747,407	5.5
6. South Carolina	574,000	4.2
7. Georgia	543,685	4.1
8. Maine	538,761	3.9
9. Wisconsin	516,732	3.8
10. Maryland	415,815	3.1
11. Montana	393,440	2.9
12. Michigan	378,315	2.8
All others	3,810,260	28.1
	13,571,530	100.0

The present status of water-power development in the United States as summarized by the Federal Water Power Commission and the Geological Survey is as follows:

	Horsepower
1. Total water power in United States (50% of time)	55,000,000
2. Corresponding capacity that will be installed	75,000,000
3. Probably 75% of this is under Federal jurisdiction	41,250,000
4. Installed Jan. 1, 1929	13,571,530
5. Licensed by Federal Water Power Commission	6,656,000
6. Constructed under F. W. P. Com. license	2,506,696
7. Under preliminary permit from F. W. P. Com.	4,856,000
8. Applications not acted upon	10,000,000

The following is a statement of electric energy generated in the United States in hydraulic plants 1920 to 1928 inclusive:

Year	Kw-Hr.	Per cent Increase
1920	16,150,000,000	...
1921	14,970,000,000	—7.3
1922	17,207,000,000	15.0
1923	19,343,000,000	12.4
1924	19,969,000,000	3.2
1925	22,356,000,000	12.0
1926	26,189,000,000	17.1
1927	29,875,000,000	14.0
1928	34,696,000,000	16.1

Average of 8 years about 10 per cent.

Publication No. 289-124, Serial Report, Water Power Development Committee.

The following gives an idea of how the power and energy for 1928 is distributed between the hydro and steam sources of supply:

	Capacity (Average of year) Kw.	Output Kw-hr.	Average Kw.	Capacity Factor
Hydro ..	7,658,000	34,696,000,000	3,960,616	51.7
Steam ..	20,852,000	53,154,000,000	6,067,808	29.1

In the operation of systems including both water power and steam stations, as a general rule, the water power stations are favored and, therefore, operate under higher capacity factors.

Economics of Power Use

There is a wide difference in the cost of producing hydro-electric power in different plants. The principal variable factors in hydro-electric power costs are size of the development, continuity and dependability of water supply and physical features affecting location of the plant. The plants at Niagara Falls and those proposed on the St. Lawrence and Colorado Rivers involving many thousands of kilowatts may be capable of producing energy and delivering it to the station bus bars at an overall cost of from 2 to 4 mills per kw-hr., but the greater number of water power plants scattered over the country develop energy at cost of two or three times this amount. We may safely say that the greater part of the hydro energy generated in the United States costs between 5 and 10 mills per kw-hr. at the generating station bus bars.

The principal variable factors in steam-electric power costs are size of plant, cost of coal and cost of condensing water. The largest and most favorably located steam electric plants operating under high load and plant factor conditions may produce energy at an overall cost as low as 4 mills per kw-hr. but the greater number of steam plants develop energy at a cost of 6 to 10 mills per kw-hr. at the station bus bars. Load factors affect costs in both classes of stations.

We may roughly class all electric energy in two categories, namely (1) low-cost hydro energy from favorably located plants and (2) all other energy, whether generated by water or steam power. The question has been raised as to who shall get the benefit of the low-cost energy. Three solutions have been proposed: 1st, to let the producer sell it for what he can get for it; 2nd, to let the government tax it to bring the cost up to that of steam-produced energy, and 3rd, to let the consumer get the benefit of it.

Experience has shown that the first of these alternatives, namely, to let the producer sell it for what he can get, automatically gives a low price aside from any public regulatory agencies to which the producer may be subject. Such hydro developments are always very large and must be developed, for the most part, all at one time. The result is a large amount of power for which a market must be found at the earliest practicable date, within a definite small radius. Such power has always been sold at a low price and a low margin of profit. Companies exploiting such power developments have generally not fared so well as those developing the higher cost steam power which can be produced by extending the plants at rates just sufficient to take care of the demand.

The second suggestion, that the government shall tax the output for the benefit of all the people until neither the producer nor consumer gets benefit from it, cannot be justified from any point of view, although it is favored by certain legislators and others who ignore the fact that such tax operates to deprive the public of the principal benefit that can come from low cost water power. Such a tax on power at its source is a direct burden on industry and an indirect burden on the consumer of the products of industry. It is, in effect, a tariff to equalize costs and would serve to deprive certain portions of the public of the natural advantages of their location. It would be as logical, and as fair, to use a similar expedient to equalize the cost of fuel, natural gas or coal or oil, as between communities. There are certain fundamental industries that cannot exist without this low-cost energy, and which have been built up on the basis of cost of energy much below that of steam-produced energy. This second proposal would destroy them.

The third alternative, that the consumer should get the benefit of low-cost power, will scarcely be questioned by anyone who looks at the matter from the point of view of the greatest good to the greatest number. This brings up the question as to how the benefits can best be apportioned to the "consumer." In this country it has been the general practice to base rates to all consumers on the cost of service. As opposed to this practice there are some people who advocate a policy of favoring the domestic consumer by making domestic rates very low at the expense of commercial and industrial users.

The advantage of the practice of distributing the benefits of low-cost hydro energy equitably to all consumers is that it gives industrial rates sufficiently low to make it possible for large industries to be built up, producing abrasives, metal alloys, aluminum, bleaching materials, etc., at much lower cost than they can otherwise be produced. This is passed along to the ultimate consumer everywhere when he purchases automobiles, kitchen utensils, cutlery, soap, newspapers, tools, etc., etc. Furthermore, this low-cost energy is fundamental to the growth and expansion of that class of basic industry. A saving of a few dollars a year to the individual householder in cost of energy for domestic use through subsidizing that service at the expense of industrial users is not to be compared with the advantages of steady employment, regular wages and the consequent higher standard of living.

In Canada we have two fairly large examples of different ways of using cheap water power. For about fifteen years Ontario Province has been operating to favor the domestic consumer at the expense of the commercial and industrial user, whereas for about five or six years Quebec Province has followed a policy of using its cheap water powers to stimulate industrial growth. While the Quebec policy has not been in existence long enough to obtain full effect, it was thought that a comparison of the growth of industry in Quebec and Ontario might give some indication of the results obtained under the different policies. Mr. W. M. Carpenter, Research Statistician of the National Electric Light Association, has compiled the following table from data furnished by the Bureau of Statistics, Ottawa, Canada. The table shows results which are certainly worth consideration by statesmen, financiers and economists in this country.

COMPARISON OF GROWTH OF POWER AND BUSINESS IN ONTARIO AND QUEBEC

Percentage Increases, 1925 to 1927

	Quebec	Ontario
	Per cent	Per cent
Population	3.3	2.7
Electric Power		
Main primary h.p.	23.9	6.0
Capital invested	31.7	10.3
Kilowatt-hours generated	61.3	28.2
Manufacture		
Capital invested	21.2	10.8
Employees	16.6	11.9
Salaries and wages	20.1	15.6
Value added by manufacture	26.5	17.2
"Value added," per capita	22.5	14.1
"Value added," per employee	8.5	4.8
Business and Wealth		
Bank debits to individual accounts	49.2	30.3
Building permits in cities	65.8	33.4

RÉSUMÉ OF WORK OF THE WATER POWER DEVELOPMENT COMMITTEE OF THE N. E. L. A.

For several years the National Electric Light Association has had a Water Power Development Committee. The reports of this committee, usually annual, constitute a very instructive current history of the development of water power in this country. They give much valuable data respecting the potential and developed water powers of the country, and discuss comprehensively the many problems, physical, economical and political, which have affected water power development.

Without doubt, the work of this committee has had a constructive influence on water power development.

The following summary of the reports describes briefly the epochs through which water power development has passed.

Prior to 1901

Up to the Roosevelt administration in 1901, water-power development was controlled principally by economic factors. The use of electricity was rather limited and long-distance transmission of power had just been begun, the amount of water power developed was less than 2,000,000 h.p., and most of it was on the smaller streams not under Federal control, and was not used for producing electricity. The acts of May 18, 1896, and March 3, 1899, both bearing on the protection of navigation, made it necessary for proponents of power developments on navigable streams to obtain consent of Congress and approval of plans by the Secretary of War and the Chief of Engineers.

The acts of May 14, 1896, and Feb. 15, 1901, authorized the Secretary of Interior to grant revocable permits for power projects on public lands, and the act of Feb. 1, 1905, authorized the Secretary of Agriculture to grant them on forest reserve lands.

Projects not on navigable streams or public lands or in forest reserves were developed under State laws.

1901 to 1920

During the Roosevelt administration the doctrine of conservation came into prominence, and greatly exaggerated values were claimed for water power resources. All public lands that might be used for water power development were withdrawn from entry. The General Dam Act of 1906 was enacted to control developments on navigable streams, and this was followed by the General Dam Act of June 23, 1910. Specific authorization by Congress was still required for each project on a navigable stream. Neither of the General Dam Acts satisfied the views of the more ardent conservationists who originated them, and on account of their opposition very few projects were able to secure congressional authority. By 1920 the total water power developed in the United States amounted to about 7,750,000 h.p., of which about 2,000,000 was under Federal jurisdiction and 5,750,000 h.p. under State jurisdiction.

Of the 2,000,000 h.p. under Federal jurisdiction, practically all, except the Niagara Falls projects, the Keokuk project on the Mississippi River and the Hales Bar project on the Tennessee River, was developed on western streams under the acts of 1891 and 1905, which did not require special authorization of Congress for each project. This was a period of rapid growth in the use of electricity, and long-distance transmission of power became practicable, making it possible to develop more or less remote water powers and sell the output in distant markets.

1920 to Date

On June 20, 1920, the Federal Water Power Act was enacted after ten years struggle in Congress to procure legislation that would define Federal policy with respect to water power in a way more satisfactory to the various schools of thought than the General Dam Act of 1910 or the legislation affecting public and forest reserve lands. The Federal Water Power Act established a commission consisting of the Secretary of War, the Secretary of Interior and the Secretary of Agriculture. This commission was authorized to issue licenses for water power developments on all streams under Federal jurisdiction on public lands and in the forest reserves on terms intended to fully protect the public interest.

High fuel prices and transportation difficulties resulting from the war, together with the accumulation of many practicable water-power developments which had been waiting to procure Federal authority, caused great activity to follow the passage of the Federal Water Power Act.

At the end of 1928 water-power development in the United States had increased to about 13,571,530 h.p., 5,821,530 h.p. more than in 1920. Of the total power installed, about 4,507,000 h.p. was under Federal jurisdiction.

The Water Power Development Committee cooperated with the Federal Power Commission in drafting regulations under the act and in trying to make it effective, and for a time it appeared that the various schools of thought on water power would be satisfied, but for the past three years there have been efforts by some interests to obtain special legislation that would exempt certain projects from the jurisdiction of the Federal Power Commission.

The reports of the Water Power Development Committee indicate reasons for this condition, which are worth attention.

The report of 1926 states:

"There are pending in Congress various bills affecting the Colorado, Tennessee and other rivers. For the most part these bills seek to obtain special legislation. On the Tennessee and on the Colorado various kinds of publicly owned projects are proposed, and in connection therewith it is sought to suspend the jurisdiction and authority of the Federal Power Commission over these streams. On the Colorado it is proposed to suspend the jurisdiction of the Commission until 1929, and on the Tennessee until 'Congress has taken final action for the control, operation or disposition of Dam No. 2 at Muscle Shoals.' No one can forecast when Congress will take final action on Muscle Shoals, although in March it took a long step toward clearing up the whole problem by voting to negotiate private leases for this famous project for a period of fifty years. Leases were under negotiation by a special committee of Congress when this report was written.

"It is a matter of regret that Congress has been asked to exempt these rivers from the provisions of the Federal Water Power Act. The act was designed to establish a uniform policy to govern the development and utilization of water power throughout the country. It has been so accepted by the industry and the public alike, and its essential soundness is attested by the extensive developments undertaken and projected under its terms. The act should be consistently applied to all streams, large or small, in all sections of the country. Exemption of certain projects from its provisions and from the jurisdiction of the Federal Power Commission must of necessity weaken and impair it. If such exemptions are continued they will ultimately destroy the act.

"Secretary of Commerce Hoover has very clearly recognized this in a recent discussion of the Colorado River problem, in which he stated: 'It seems to me that we should not depart from the national policy established by the Water Power Act. The handling of power (on the Colorado) should be placed in the hands of the Federal Power Commission to give licenses for the use of the water for power purposes under the Water Power Act without imposing a new system of allocation.'

"Special water power legislation for individual streams has its only excuse in political or local expediency, and is a return to the conditions which the people and Congress sought to end by the Federal Water Power Act. It is earnestly to be hoped that Congress will follow Mr. Hoover's view and neither on the Colorado nor elsewhere depart from the national policy which the Federal Water Power Act established and which has now been tested by six years of experience and achievement."

The report of 1927 states:

"Water powers nearest the available markets have now largely been developed and put into service. So, too, have the more distant water powers requiring the lowest investment. Utilization of resources not yet developed must necessarily be expected in some cases to entail higher investment costs, longer and more expensive transmission lines, and higher prices for lands and rights of way. A good proportion of the best hydro developments have already been made.

Water Power Versus Steam

"Contrasted with this, there is a downward trend in the cost of energy produced by steam. Notable improvements in plant design have been effected during recent years that have resulted in marked improvement in efficiency and a substantial reduction in the cost of producing energy. While water power will never cease to be a great national asset, the achievements in steam production have created a noticeable tendency to postpone the development of power by water. Indeed, there are already instances where water powers, selected for development two or three years ago, have been deferred for the present and steam plants installed instead. There are other instances where steam in recent months has been brought in to supplement water power to a degree that a few years ago would have been regarded as unnecessary.

"On most of the great streams of the country the development of water power is completely held up pending the enactment of necessary legislation that, in turn, has become involved in the meshes of politics. But industry declines to wait, and engineers, fighting to bring down costs, have improved the development of power by steam to the point where more than one large water power project has lost its place in the sun, and projects that were considered attractive five years ago no longer appeal to capital. Economic and natural laws are inexorable, and neither the romance of 'white coal' nor popular interest in natural resources can make capital develop a water power where an equivalent amount of energy can be produced from steam for less money."

The report of 1928 gives the following table indicating how much of the total water power of the United States was developed at that time, how much was probably economically feasible of development and how much was not then feasible:

	Horsepower	Per cent
1. Total water power in U. S. available 50% of time.............	55,000,000	100
2. Total developed water power, January, 1928	8,800,000	16
3. Development probable in next 10 to 15 years	5,900,000	10.7
4. Development probably feasible if political controversies be adjusted	11,000,000	20
5. Probably not now economically feasible	29,300,000	53.3

NOTE: A discrepancy will be noted between the figures in the above table and those previously given for developed water power. The figures previously given represent the installed capacity, while those in the table represent the power available 50 per cent of the time.

The report then continues:

"Until developed, water power produces nothing; when developed it continues to produce indefinitely, not being depleted by use, as are most other resources. The importance of developing the water powers that are feasible of development needs no argument. In fact, for the past twenty years the importance and value of water power resources have been so extravagantly urged upon the public by conservation enthusiasts, government operation advocates and others that no sane and reasonable policy of dealing with the development of water power has been able to exist for long. In June, 1920, after twelve years' discussion in Congress, the Federal Water Power Act was made a law and established policies for dealing with water powers under Federal jurisdiction. While not completely satisfactory to anybody, the act was workable, and great activity in water power development followed its passage. Eight years of operation have demonstrated that, whatever else may be said of the act, it certainly is adequate to protect the public interest under all conditions. In spite of this fact, it has been subject to attacks which have increased each year until it has become, temporarily at least, inoperative with respect to many of the larger and more feasible power prospects."

No subject before the country has had so much misinformation published about it as water power. The reports of the Water Power Development Committee stand out for their accuracy and soundness and are worthy of nation-wide study.

Water Power Policy

In October, 1928, the United States Chamber of Commerce appointed a "National Water Power Policies Committee" consisting of the following members:

Frederic A. Delano, *Chairman,* Washington, D. C.
Thomas S. Baker, *President,* Carnegie Institute of Technology, Pittsburgh, Pa.
Arthur S. Bent, *President,* Bent Brothers, Inc., Los Angeles, Cal.
Frank P. Glass, *Editor,* Montgomery *Advertiser,* Montgomery, Ala.
Lafayette Hanchett, *President,* Utah Power & Light Company, Salt Lake City, Utah.
David C. Henny, *Consulting Engineer,* Portland, Ore.
Horace W. King, *Professor Hydraulic Engineering,* U. of Mich., Ann Arbor, Mich.
Alexander Legge, *President,* International Harvester Company, Chicago, Ill.
Charles H. MacDowell, *President,* Armour Fertilizer Works, Chicago, Ill.
Frank I. Mann, Bois d'Arc Farm, Gilman, Ill.
Harold G. Moulton, *President,* Brookings Institution, Washington, D. C.
R. E. Norton, *Vice-President,* C. H. Geist Securities Corporation, Philadelphia, Pa.
Warren Olney, Jr., *Attorney,* San Francisco, Cal.
Lewis B. Stillwell, *Consulting Engineer,* New York, N. Y.
Harry Taylor, *Maj. Gen., Ex-Chief of Engineers, U. S. A.,* Washington, D. C.

The purpose of the committee is set forth in the following language in the letter of invitation to serve on the committee:

"The importance to the public welfare of proper development of the country's resources in water powers has long been recognized by the United States Chamber of Commerce. The Chamber earlier had a representative committee which considered the situation as it existed before the Federal Water Power Act, and made recommendations as to Federal policies, which were supported by our membership in referendum vote, and which proved very similar to most of the features subsequently incorporated in the Federal Water Power Act.

"In the opinion of our Board of Directors the time has come for the Chamber to have a committee to consider the present situation as to water powers and their development and to submit a report with recommendations respecting the policies which should now be followed, in the light of experience and events since 1920. In accordance with the Chamber's procedure, the whole subject will be placed before this committee, without suggestions or commitments of any kind. The purpose is to obtain the independent judgment of a representative committee. The committee will consequently be entirely free to decide for itself both the features of the water power situation which it will select for special treatment in its report and the recommendations of public policy which it will make. We desire the committee to have this independence of judgment not only as to the general subject before it, but also in regard to special problems, such as have arisen with respect to the development at Muscle Shoals."

It is understood that the United States Chamber Committee is planning to make its report in the fall of 1929. Obviously, the power industry should cooperate with the Chamber Committee by furnishing any data that the committee may desire.

On March 25, 1929, the report of the Joint Water Power Committee of the Senate and House of Representatives of the Sixty-sixth General Assembly of the State of Tennessee was submitted.

This report is well worth study. It gives a clear and unbiased analysis of the water power situation and recommends a policy for the State of Tennessee.

The following concluding paragraphs of the report are worth quoting:

"We doubt whether most of us appreciate the difficulties and expense in the development of water power in this basin. There is an impression that if power can be developed from water it costs nothing. Let us consider the Tennessee. At times she rages in flood with an immense volume of water. At other times there is less than a foot of water in the channel. The fall of the river is gradual, only a few feet comparatively all the way from Knoxville to the Ohio. It is difficult to provide storage in this section of the river because the banks are low and because of the immense amount of land which would be flooded by high dams. Then for nearly every hydro-electrical development we would have to have also a steam plant, a duplication in capital expenditure. Homes and factories don't want electricity merely when there happens to be plenty of water in the river. You couldn't get by with that kind of service. They expect to have it whenever the switch is turned. Also, generally, a hydro-electric development costs vastly more than a steam power plant of the same capacity because there are the flood lands to be acquired, the dams to be built, the generating machinery to be provided, etc. It is better, in our judgment, however, from the standpoint of the State, for the water power to be utilized. We save the coal. We have a much bigger investment to be taxed and the water power man has the urge to bring in industries to use his power. If he has a steam plant, when the demand for power goes off, when the factories close for the day, he doesn't burn any more coal. But if he has a hydro plant the power which is not sold is wasted. Therefore, he searches the country over to bring in industries to use his product. He makes a very low rate for power which may be developed at night and for which there is no other demand, and brings in certain kinds of industries which demand cheap power and which can afford to run at night. And then, insofar as the developments reduce the hazard from flood and promote navigation, they also benefit the public.

"We are certain that the great preponderance of the sentiment of the people of our State favors the earliest possible development of our rivers for purposes of flood control, navigation and power, and also that it favors the development of power by a public utility so that distribution to serve our citizens everywhere as far as possible may be insured. We are convinced that the great preponderance of the sentiment favors development and distribution by private capital, subject to the sovereign control of the State, providing a fair incentive and a reasonable return, and power to our people at the lowest reasonable cost. And we are convinced that there is no reason why these developments should not be carried forward at the earliest possible date, knowing as we do that the sovereign power of the State and of its people is ample to protect against any attempted exploitation."

The views of the power industry with respect to a national policy on water power may be deduced from the reports of the Water Power Development Committee of the National Electric Light Association.

Since the matter is now under active consideration, it seems pertinent to summarize those views in concluding this report.

The outstanding principles are:

1. Whenever the market will justify and the cost will not exceed that of steam or other development, water power resources should be developed to the fullest practicable extent and in the shortest possible time.
2. The greatest benefit from the large water-power developments of the country, such as the St. Lawrence, Tennessee, Columbia, etc., will be the growth and general prosperity of the adjacent territory which will be due to the industrial growth that naturally follows these developments.
3. In general, the greatest utilization can be secured for water-power developments when they are part of large central station systems. This is specially true if there are other uses of the water, such as irrigation, navigation and flood control, all of which result in variable rates of output whose inequalities can usually be tolerated in or absorbed by a large interconnected system of steam and water power plants.
4. Special charges or taxes assessed against water power development by Federal or State governments limit the extent to which water power can be used to foster industrial development; consequently such charges should not be imposed.
5. Regulation by public agency should be provided (as it now is in practically every State) to secure proper service at fair rates to all consumers.
6. The Federal Water Power Act in its present form can be administered so as to promote the development of all water power for which a market exists, and it provides ample safeguards for the public interest. Water powers for which no market exists should be withheld from development until economic conditions warrant bringing them into use.
7. The tendency to exempt from the jurisdiction of the Federal Water Power Commission any projects over which the Federal Government has jurisdiction is unsound and leads to undesirable delay and inefficiency in the development of feasible water powers.

REPORT OF EDUCATIONAL COMMITTEE

Permanent and lasting results of employee education can only be obtained by carrying out a carefully defined plan which includes liberal cooperation of the company. The best results are obtained where such a plan is recommended by a representative committee and receives executive approval.

The operation of such a plan to be successful must be placed in charge of some one as educational director, either as his full time job or as a part-time job depending upon the size of the company, to see that proper publicity within the company is given to all approved courses, and to cooperate with departments and employees in the organization of groups or classes, and to advise in individual cases.

The committee continues to believe that our relations with our customers and the public depend to a very large degree upon the education and training of the employees to the end that they may conduct the company business in an efficient, courteous and businesslike manner.

The results of the work of the Educational Committee during the last Association year ending June 30, have exceeded that of any previous year. A total of 3379 of the various courses now offered by the committee were distributed, as against 2197 for the previous year, an increase of 54 per cent. This increase is largely due to the new Meter Courses conducted for the Engineering National Section. We believe, however, that there would be a very much larger distribution if all member companies were familiar with the advantages of using these courses, and would formulate some definite plan of employee education as already adopted by a large number of member companies.

The following is a list of member companies who have sent in fifty or more subscriptions during the year ending June 30:

Public Service Electric & Gas Co., Newark, N. J.	343
Jersey Central Power & Light Co., Asbury Park, N. J.	189
Gulf States Utilities Co., Beaumont, Tex.	164
Consumers Power Co., Jackson, Mich.	128
West Penn Power Co., Pittsburgh, Pa.	81
Lawrence Gas & Electric Co., Lawrence, Mass.	77
Associated Gas & Electric Co., Ithaca, N. Y.	77
Blackstone Valley Gas & Electric Co., Pawtucket, R. I.	73
Public Service Company of Colorado, Denver, Colo.	65
Monongahela West Penn Public Service Co., Fairmont, W. Va.	58
New York & Queens Electric Light & Power Co., Flushing, N. Y.	54

The committee particularly wishes to acknowledge the interest and cooperation of the Engineering National Section Meter Committee in the preparation and promotion of the Meter Courses, and of the Accounting National Section in the preparation and promotion of the Advanced Accounting Course.

Educational Conference

To stimulate interest in educational work the chairman of the Southwestern Geographic Division called an educational conference last January in Dallas immediately following the meeting of the Executive Committee of that division. This conference was attended by many executives and educational representatives of the companies, as well as others interested. It was the pioneer conference on education, and both educational and executive representatives stated they learned more about employee education there than they thought was possible. This is to be an annual meeting, and will prove a real stimulus to the work.

The program of this conference, which continued for the greater part of one day, included a presentation of the Educational Courses of the association by the chairman, addresses by educational directors, addresses by executives, and a general discussion of educational methods and results within the companies represented at the meeting.

It is recommended that the chairmen of all Geographic Divisions conduct an educational conference following an Executive Committee meeting along the same lines as the Dallas conference.

The increased use of the Educational Courses is largely due to the work and experience of the Geographic Division representatives, many of whom have given their services to this committee for several years.

On the following pages will be found a brief description and outline of the courses offered by this committee, together with a sample page from each of the various courses.

FIG. A-1—DISTRIBUTION OF COURSES BY GEOGRAPHIC DIVISIONS FOR YEAR ENDING JUNE 30, 1929.

ELEMENTARY COURSE IN BOOKKEEPING AND ACCOUNTING

Published for the Accounting National Section

The purpose of this elementary course, which consists of seven lessons, is to teach the principles of accounting as applied in accounts, books of account, and business forms; also to familiarize the student in the recording of transactions from business forms, and the method of arriving at a final conclusion as set forth in the balance sheet and the profit and loss statement.

A trading business is represented in all these lessons because the fundamental principles are more easily set forth in this line than in production. While these principles are the same yet the presentation is more complicated in a business engaged in manufacture or production.

It is necessary that the student understand and appreciate the importance of these elementary lessons and a knowledge of the fundamentals of bookkeeping before subscribing to the Advanced Course in Electric Utility Accounting.

First Lesson

Introduction—Bookkeeping.
Why Study Bookkeeping?
Method of Earning Income.
Bookkeeping Terms.
Assets.
Liabilities.
Proprietorship.
Income.
Cost.
Fundamental Equations.
Transactions and Their Connection with Bookkeeping.
Purpose of Bookkeeping.
The Account—a Bookkeeping Device.
The Ledger—A Group of Accounts.
Accounts Needed for Recording Cash Sales and Purchases.
Cash Account.
Method of Proving Cash.
Purchases Account.
Sales Account.
Method of Recording Transactions.
The Trial Balance, a Bookkeeper's Device.

Second Lesson

Accounts with Persons.
Accounts with Customers.
Accounts with Creditors.
Accounts with Operating Expenses.
Expense Account.
Accounts with the Proprietor.
Capital Accounts.

Third Lesson

Short-cut Method.
Purchases Record.
Purchases Journal.
Sales Journal.
Cash Record.
Cash Book.
The General Journal—Its Use.
Donald D. Sells, retail hardware merchant, practice set.
H. A. Popp, retail coal dealer, practice set.

Fourth Lesson

The Purchase Invoice.
The Sales Ticket.
The Sales Invoice.
Receipts, Issued and Received.
Reports to the Instructor.
Method of Proving Cash.
The Trial Balance.

Fifth Lesson

Fiscal Period.
Method of Ascertaining the Profit and Loss.
Merchandise Inventory.
The Balance Sheet.
Statement of Profit and Loss.
Relation Between the Balance Sheet and Statement of Profit and Loss.
Closing the Ledger.
Balancing and Account.
The Post-Closing Trial Balance.
Closing Process.
The Profit and Loss Account—A Supplementary Account.

Sixth Lesson

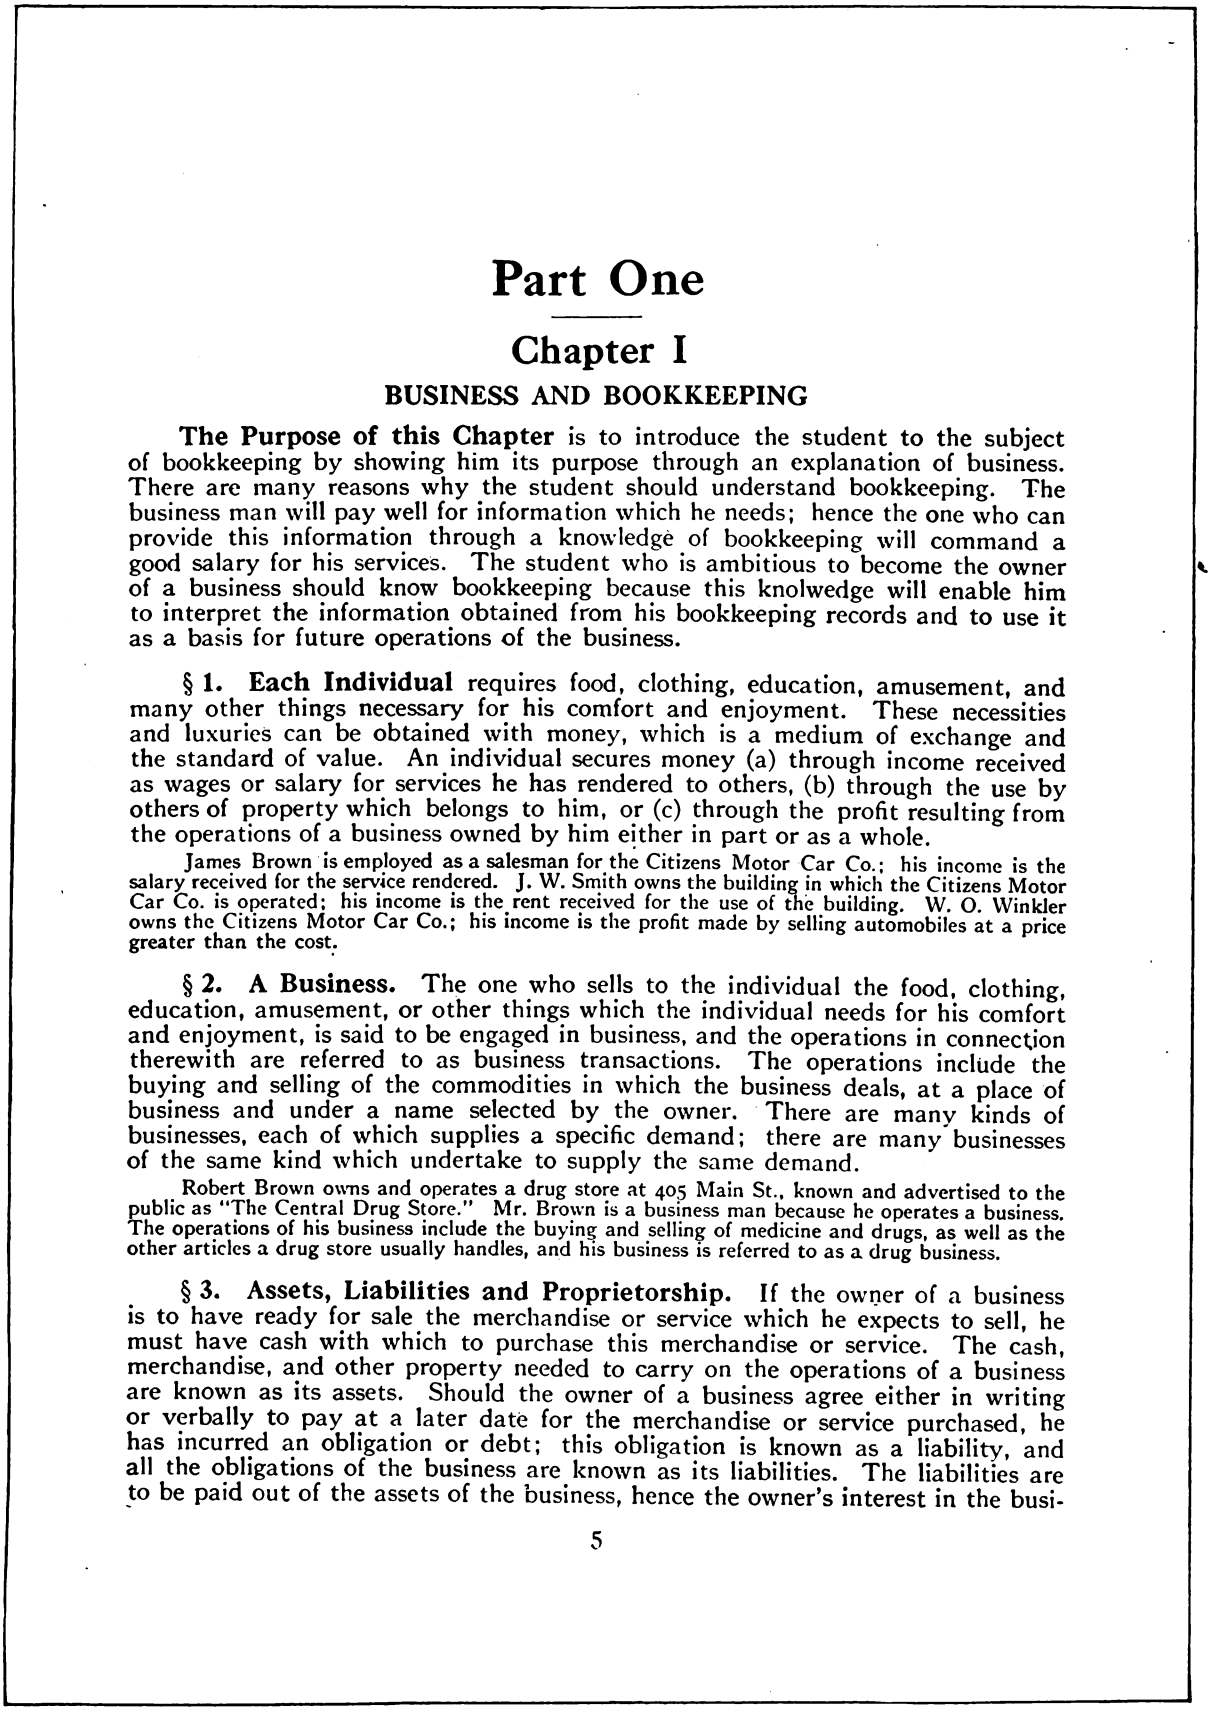
Vouchers in Connection with Purchases.
Vouchers in Connection with Sales.
Vouchers in Connection with Services.
Vouchers in Connection with Banking Transactions.
Reconciliation of Bank Account.
Vouchers Regarded as Cash.
Indorsement of Notes, Drafts or Checks.
The Promissory Note.
The Commercial Draft.

Seventh Lesson

Accounts with Fixed Assets.
Accounts with Notes and Drafts.
Notes Receivable Account.
Notes Payable Account.
Interest—The Use of Money.
Accounts with Interest.
Classification of Accounts.
Asset Accounts.
Liability Accounts.
Capital Account.
Income Account.
Cost or Expense Accounts.

Price for the full course of seven lessons including correspondence service and certificate is $16.00.

Descriptive folder giving full details and outline furnished upon application.



Part One

Chapter I

BUSINESS AND BOOKKEEPING

The Purpose of this Chapter is to introduce the student to the subject of bookkeeping by showing him its purpose through an explanation of business. There are many reasons why the student should understand bookkeeping. The business man will pay well for information which he needs; hence the one who can provide this information through a knowledge of bookkeeping will command a good salary for his services. The student who is ambitious to become the owner of a business should know bookkeeping because this knolwedge will enable him to interpret the information obtained from his bookkeeping records and to use it as a basis for future operations of the business.

§ 1. **Each Individual** requires food, clothing, education, amusement, and many other things necessary for his comfort and enjoyment. These necessities and luxuries can be obtained with money, which is a medium of exchange and the standard of value. An individual secures money (a) through income received as wages or salary for services he has rendered to others, (b) through the use by others of property which belongs to him, or (c) through the profit resulting from the operations of a business owned by him either in part or as a whole.

James Brown is employed as a salesman for the Citizens Motor Car Co.; his income is the salary received for the service rendered. J. W. Smith owns the building in which the Citizens Motor Car Co. is operated; his income is the rent received for the use of the building. W. O. Winkler owns the Citizens Motor Car Co.; his income is the profit made by selling automobiles at a price greater than the cost.

§ 2. **A Business.** The one who sells to the individual the food, clothing, education, amusement, or other things which the individual needs for his comfort and enjoyment, is said to be engaged in business, and the operations in connection therewith are referred to as business transactions. The operations include the buying and selling of the commodities in which the business deals, at a place of business and under a name selected by the owner. There are many kinds of businesses, each of which supplies a specific demand; there are many businesses of the same kind which undertake to supply the same demand.

Robert Brown owns and operates a drug store at 405 Main St., known and advertised to the public as "The Central Drug Store." Mr. Brown is a business man because he operates a business. The operations of his business include the buying and selling of medicine and drugs, as well as the other articles a drug store usually handles, and his business is referred to as a drug business.

§ 3. **Assets, Liabilities and Proprietorship.** If the owner of a business is to have ready for sale the merchandise or service which he expects to sell, he must have cash with which to purchase this merchandise or service. The cash, merchandise, and other property needed to carry on the operations of a business are known as its assets. Should the owner of a business agree either in writing or verbally to pay at a later date for the merchandise or service purchased, he has incurred an obligation or debt; this obligation is known as a liability, and all the obligations of the business are known as its liabilities. The liabilities are to be paid out of the assets of the business, hence the owner's interest in the busi-

FIG. 1—SAMPLE PAGE FROM LESSON 1 OF THE ELEMENTARY COURSE IN BOOKKEEPING AND ACCOUNTING.

ADVANCED COURSE IN ELECTRIC UTILITY ACCOUNTING

Published for the Accounting National Section

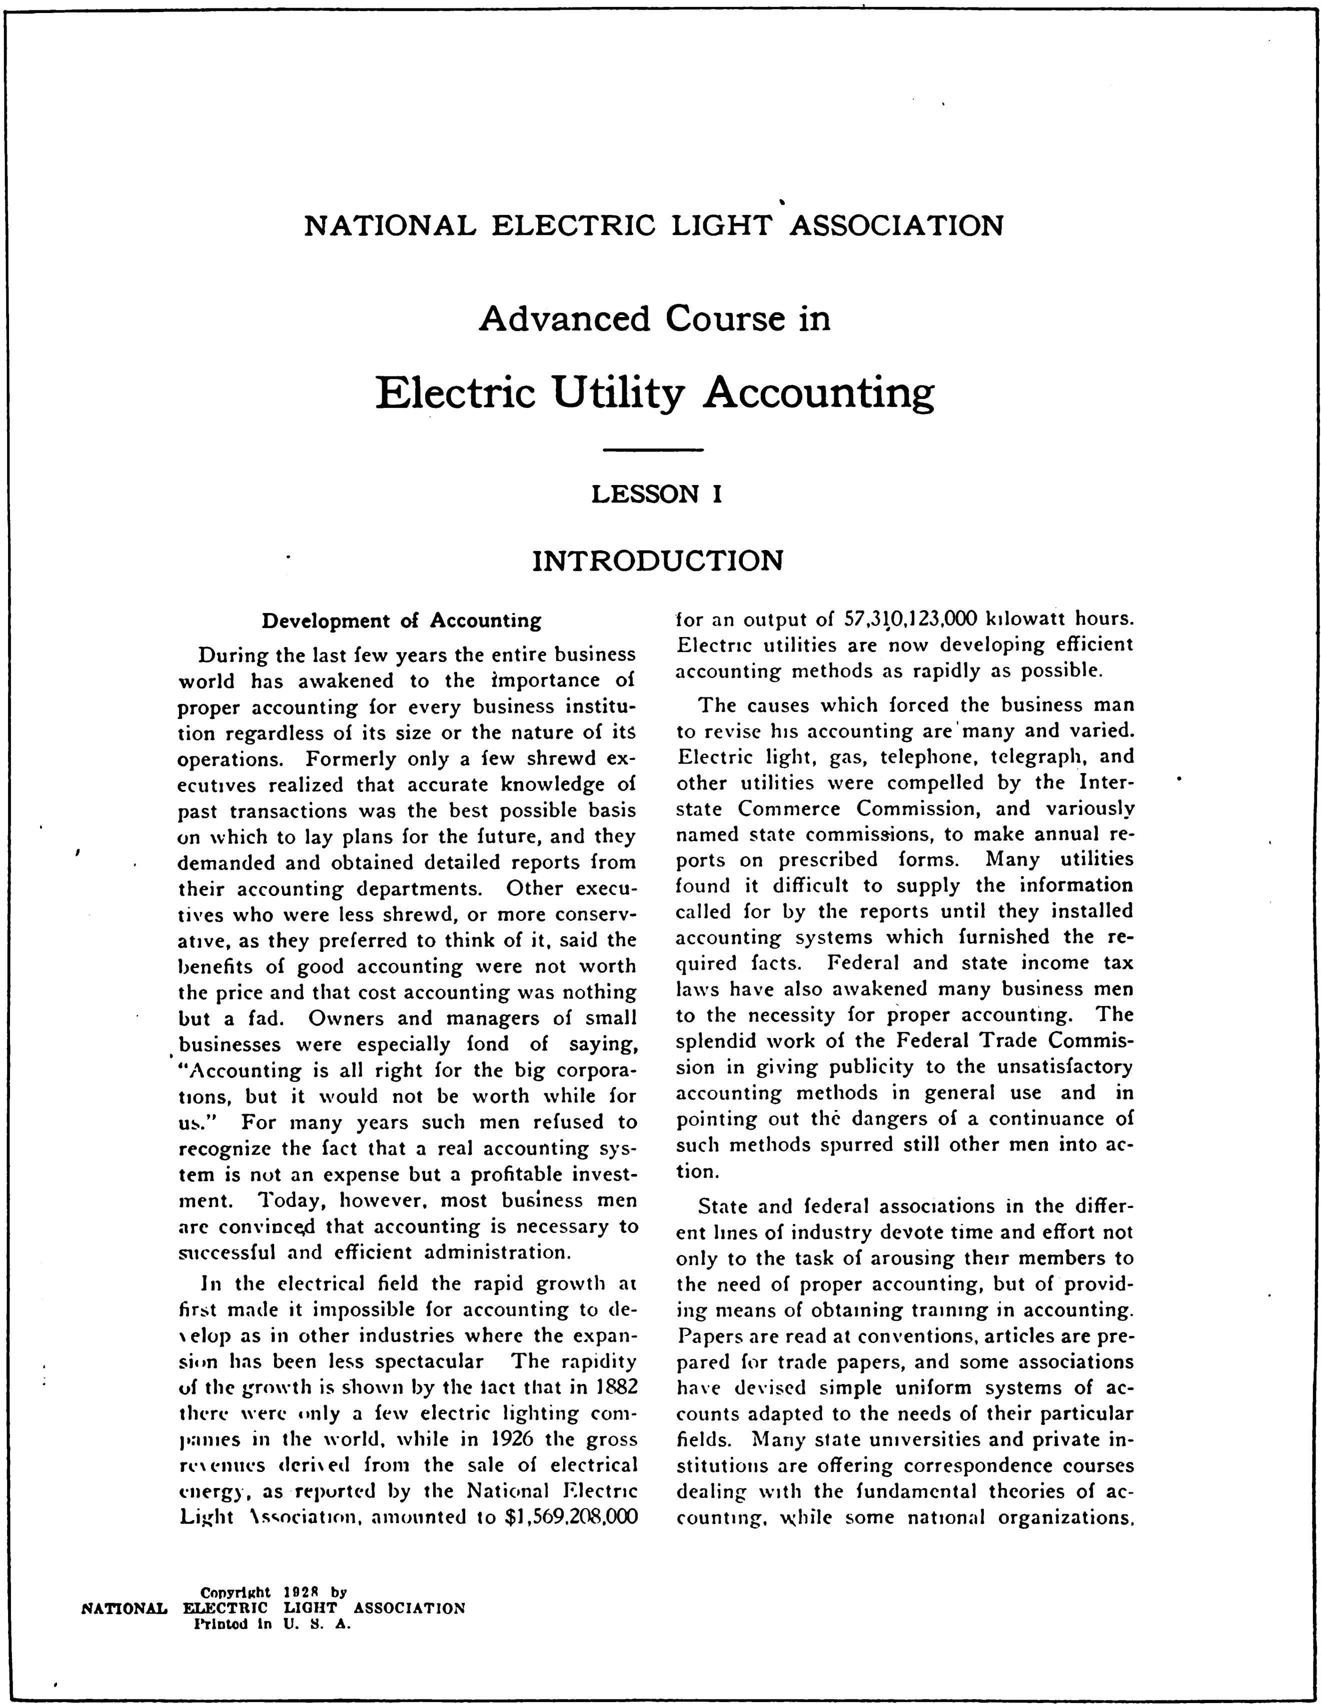
This course has just been through a complete revision by a special committee of the Accounting National Section. The demand for such a course has arisen because of the general nature of accounting instruction that is available for our industry. The necessity for instruction has been emphasized by reason of the rapid growth of our member companies, which causes a considerable demand for a suitably trained personnel. There is a continuous and persistent demand for information on accounting matters.

This revised edition is in conformity with the Association of Railways and Utility Commissioners' Uniform Classification of Accounts, which was approved by the association at the New York convention in 1923, and contains the best practices of our most progressive companies.

Lesson 1—Introduction
Lesson 2—The Uniform Classification of Accounts
Lesson 3—Accounts and Vouchers Payable
Lesson 4—The Corporate Form of Business Organization
Lesson 5—Corporate Books and Accounts
Lesson 6—Operating Expense Accounts
Lesson 7—Income Accounting
Lesson 8—Fixed Capital Accounting
Lesson 9—Bonds
Lesson 10—Financial Statements
Lesson 11—Payroll Accounting
Lesson 12—Stores Accounting
Lesson 13—Customers' Accounting
Lesson 14—Branch Office Accounting
Lesson 15—Applications and Reports to State Authorities.
Lesson 16—Corporate Combinations
Lesson 17—Holding Companies
Lesson 18—Insurance
Lesson 19—Sinking Funds and Reserves
Lesson 20—Budgets
Lesson 21—Accounting Efficiency
Lesson 22—Internal Check System
Lesson 23—Analysis of Accounting Reports
Lesson 24—Auditing—Part One
Lesson 25—Auditing—Part Two

Price for the full course of twenty-five lessons including correspondence service and certificate is $35.00.

Descriptive folder giving full details and outline furnished upon application.



NATIONAL ELECTRIC LIGHT ASSOCIATION

Advanced Course in Electric Utility Accounting

LESSON I

INTRODUCTION

Development of Accounting

During the last few years the entire business world has awakened to the importance of proper accounting for every business institution regardless of its size or the nature of its operations. Formerly only a few shrewd executives realized that accurate knowledge of past transactions was the best possible basis on which to lay plans for the future, and they demanded and obtained detailed reports from their accounting departments. Other executives who were less shrewd, or more conservative, as they preferred to think of it, said the benefits of good accounting were not worth the price and that cost accounting was nothing but a fad. Owners and managers of small businesses were especially fond of saying, "Accounting is all right for the big corporations, but it would not be worth while for us." For many years such men refused to recognize the fact that a real accounting system is not an expense but a profitable investment. Today, however, most business men are convinced that accounting is necessary to successful and efficient administration.

In the electrical field the rapid growth at first made it impossible for accounting to develop as in other industries where the expansion has been less spectacular The rapidity of the growth is shown by the fact that in 1882 there were only a few electric lighting companies in the world, while in 1926 the gross revenues derived from the sale of electrical energy, as reported by the National Electric Light Association, amounted to $1,569,208,000 for an output of 57,310,123,000 kilowatt hours. Electric utilities are now developing efficient accounting methods as rapidly as possible.

The causes which forced the business man to revise his accounting are many and varied. Electric light, gas, telephone, telegraph, and other utilities were compelled by the Interstate Commerce Commission, and variously named state commissions, to make annual reports on prescribed forms. Many utilities found it difficult to supply the information called for by the reports until they installed accounting systems which furnished the required facts. Federal and state income tax laws have also awakened many business men to the necessity for proper accounting. The splendid work of the Federal Trade Commission in giving publicity to the unsatisfactory accounting methods in general use and in pointing out the dangers of a continuance of such methods spurred still other men into action.

State and federal associations in the different lines of industry devote time and effort not only to the task of arousing their members to the need of proper accounting, but of providing means of obtaining training in accounting. Papers are read at conventions, articles are prepared for trade papers, and some associations have devised simple uniform systems of accounts adapted to the needs of their particular fields. Many state universities and private institutions are offering correspondence courses dealing with the fundamental theories of accounting, while some national organizations,

COURSE IN PRACTICAL ELECTRICITY

Published for the Commercial National Section

This course has undergone a thorough revision during this summer, and has been brought up to date in every respect.

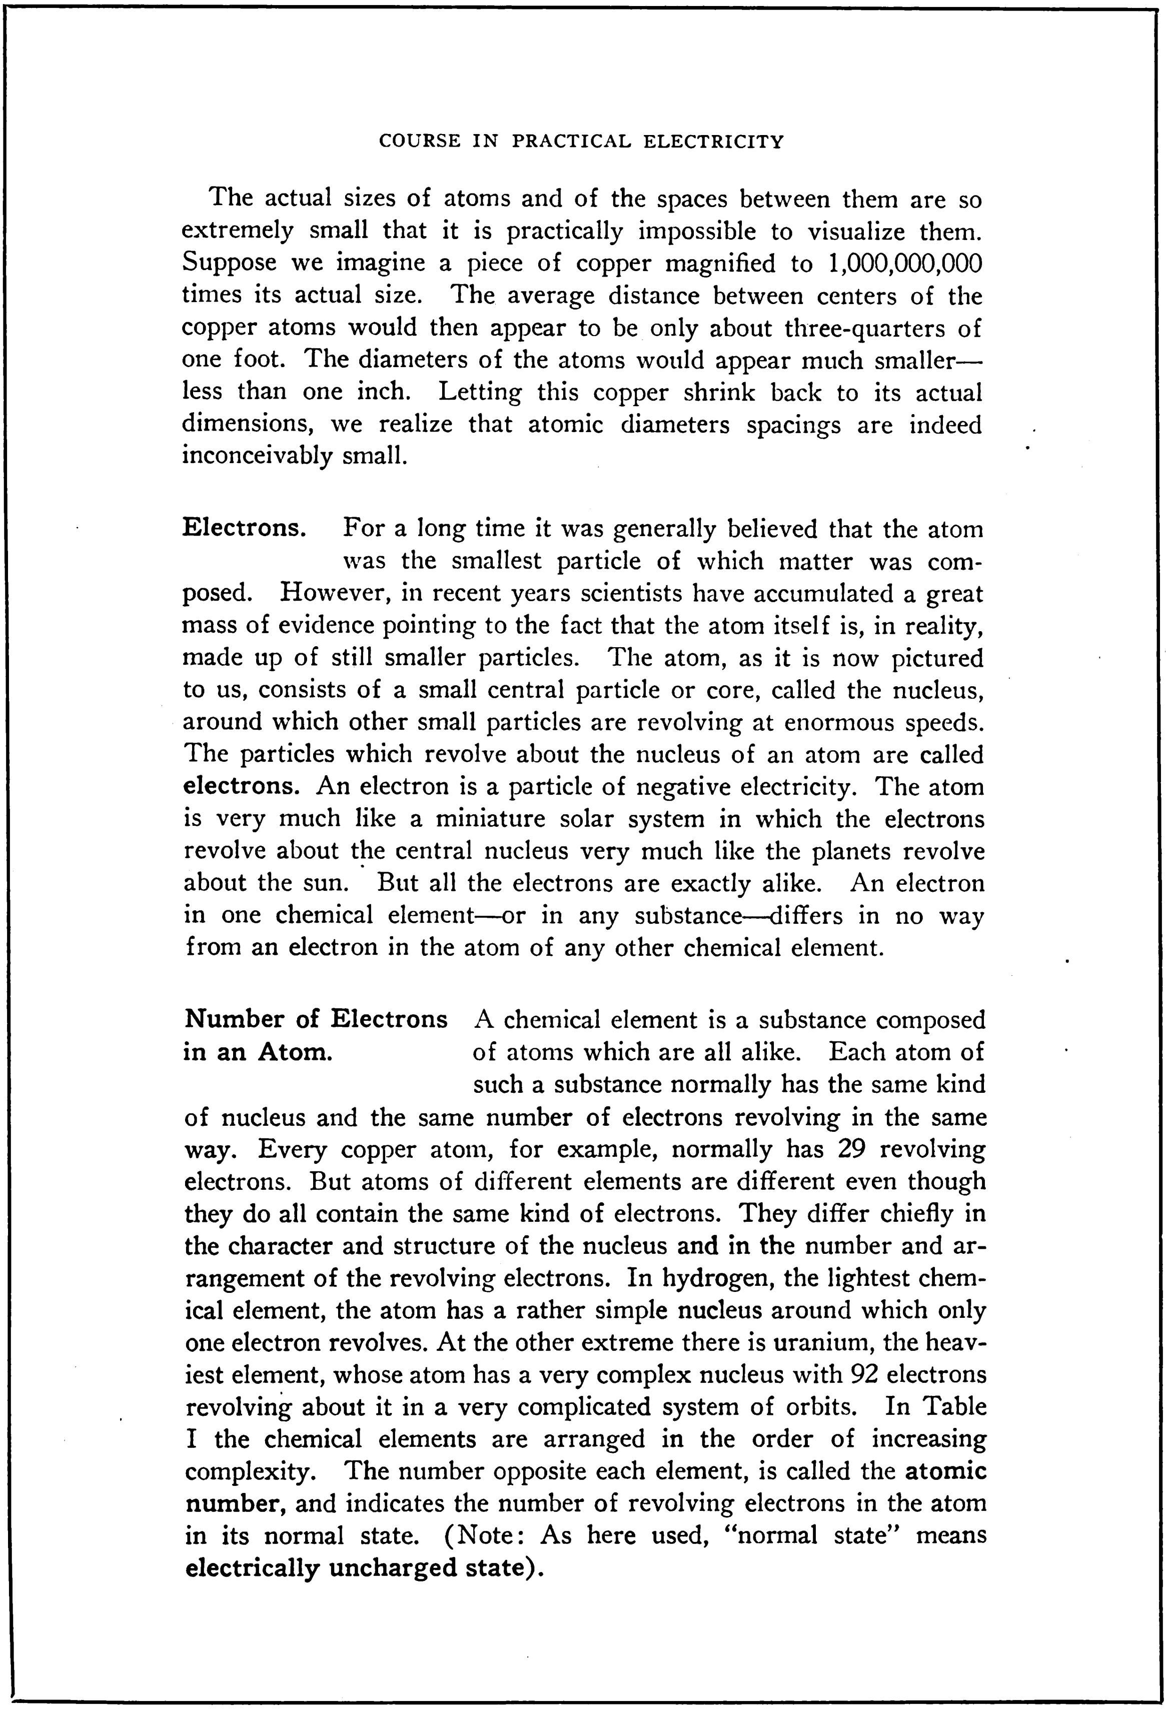
A knowledge of the fundamental principles of magnetism and electricity and an understanding of the principles of the operation of electrical apparatus is absolutely necessary for the employee who succeeds in almost any branch of the Central Station business.

This Course in Practical Electricity has been especially prepared for electric utility employees. It is written in good plain English without higher mathematics and without unnecessary technical expressions, and is specially adapted for employees in any branch of our business requiring a general knowledge, enabling them to intelligently perform their duties.

Lesson 1—Fundamental Principles of Electric Circuits
Lesson 2—Magnetic Effects of Electric Circuits
Lesson 3—Batteries and Electro-Chemistry
Lesson 4—Electrical Generators—A. C. and D. C.
Lesson 5—Alternating-Current Circuits
Lesson 6—Transformers and Regulators
Lesson 7—Motors—A. C. and D. C.
Lesson 8—Measuring Instruments
Lesson 9—Rectifiers, Lightning Arresters
Lesson 10—Lighting and Heating
Lesson 11—Central Station Systems

Price for the full course of eleven lessons including correspondence service and certificate is $12.00.

Descriptive folder giving full details and outline furnished upon application.



COURSE IN PRACTICAL ELECTRICITY

The actual sizes of atoms and of the spaces between them are so extremely small that it is practically impossible to visualize them. Suppose we imagine a piece of copper magnified to 1,000,000,000 times its actual size. The average distance between centers of the copper atoms would then appear to be only about three-quarters of one foot. The diameters of the atoms would appear much smaller—less than one inch. Letting this copper shrink back to its actual dimensions, we realize that atomic diameters spacings are indeed inconceivably small.

Electrons. For a long time it was generally believed that the atom was the smallest particle of which matter was composed. However, in recent years scientists have accumulated a great mass of evidence pointing to the fact that the atom itself is, in reality, made up of still smaller particles. The atom, as it is now pictured to us, consists of a small central particle or core, called the nucleus, around which other small particles are revolving at enormous speeds. The particles which revolve about the nucleus of an atom are called **electrons.** An electron is a particle of negative electricity. The atom is very much like a miniature solar system in which the electrons revolve about the central nucleus very much like the planets revolve about the sun. But all the electrons are exactly alike. An electron in one chemical element—or in any substance—differs in no way from an electron in the atom of any other chemical element.

Number of Electrons in an Atom. A chemical element is a substance composed of atoms which are all alike. Each atom of such a substance normally has the same kind of nucleus and the same number of electrons revolving in the same way. Every copper atom, for example, normally has 29 revolving electrons. But atoms of different elements are different even though they do all contain the same kind of electrons. They differ chiefly in the character and structure of the nucleus and in the number and arrangement of the revolving electrons. In hydrogen, the lightest chemical element, the atom has a rather simple nucleus around which only one electron revolves. At the other extreme there is uranium, the heaviest element, whose atom has a very complex nucleus with 92 electrons revolving about it in a very complicated system of orbits. In Table I the chemical elements are arranged in the order of increasing complexity. The number opposite each element, is called the **atomic number,** and indicates the number of revolving electrons in the atom in its normal state. (Note: As here used, "normal state" means **electrically uncharged state**).

FIG. 3—SAMPLE PAGE FROM LESSON 1 OF THE COURSE IN PRACTICAL ELECTRICITY.

ELECTRICAL METERMEN'S COURSES

Published for the Engineering National Section

The Electrical Metermen's Courses as offered by the Educational Committee were prepared in cooperation with the Meter Committee of the Engineering National Section, recognizing the demand of many years' standing for an elementary course in direct-current watthour metering and single-phase alternating-current metering.

This course is prepared in three parts. Part 1 applies to both the D. C. and A. C. courses, and covers subject matter necessary for these courses. Grouping these lessons into three parts makes it possible to offer two courses, either of which may be selected by the employee. Parts 1 and 2 represent a Direct-Current Meter Course, Parts 1 and 3 a Single-Phase Alternating-Current Meter Course, with Parts 1, 2 and 3 covering both Direct-Current and Alternating-Current Meters.

Part 1—Elementary Theory

Lesson 1—Electricity
Lesson 2—Electromotive Force, Current and Resistance
Lesson 3—Electric Circuits
Lesson 4—Magnetism
Lesson 5—Magnetic Circuits
Lesson 6—Direct and Alternating Currents
Lesson 7—Induced Electromotive Forces
Lesson 8—The Dynamo-Electric Generator

Part 2—Direct-Current Meters

Lesson 1—The Direct-Current Motor
Lesson 2—Direct-Current Watthour Meter—Commutator Type
Lesson 3—Direct-Current Watthour Meter—Mercury Type
Lesson 4—Full Load and Light Load Adjustments
Lesson 5—Potential Circuit of Commutator Type Meters
Lesson 6—Bearings
Lesson 7—Watthour-Meter Test Methods and Formulas
Lesson 8—Standards
Lesson 9—Test Procedure

Part 3—Single-Phase Alternating-Current Meters

Lesson 1—Alternating-Current Units
Lesson 2—Alternating-Current Motor and Watthour Meter
Lesson 3—Induction Watthour-Meter Characteristics
Lesson 4—Commercial Types of Induction Watthour Meters and Types of Magnetic Circuits
Lesson 5—Full Load, Light Load, and Lag Adjustments
Lesson 6—Bearings
Lesson 7—Watthour-Meter Test Methods and Formulas
Lesson 8—Standards
Lesson 9—Test Procedure

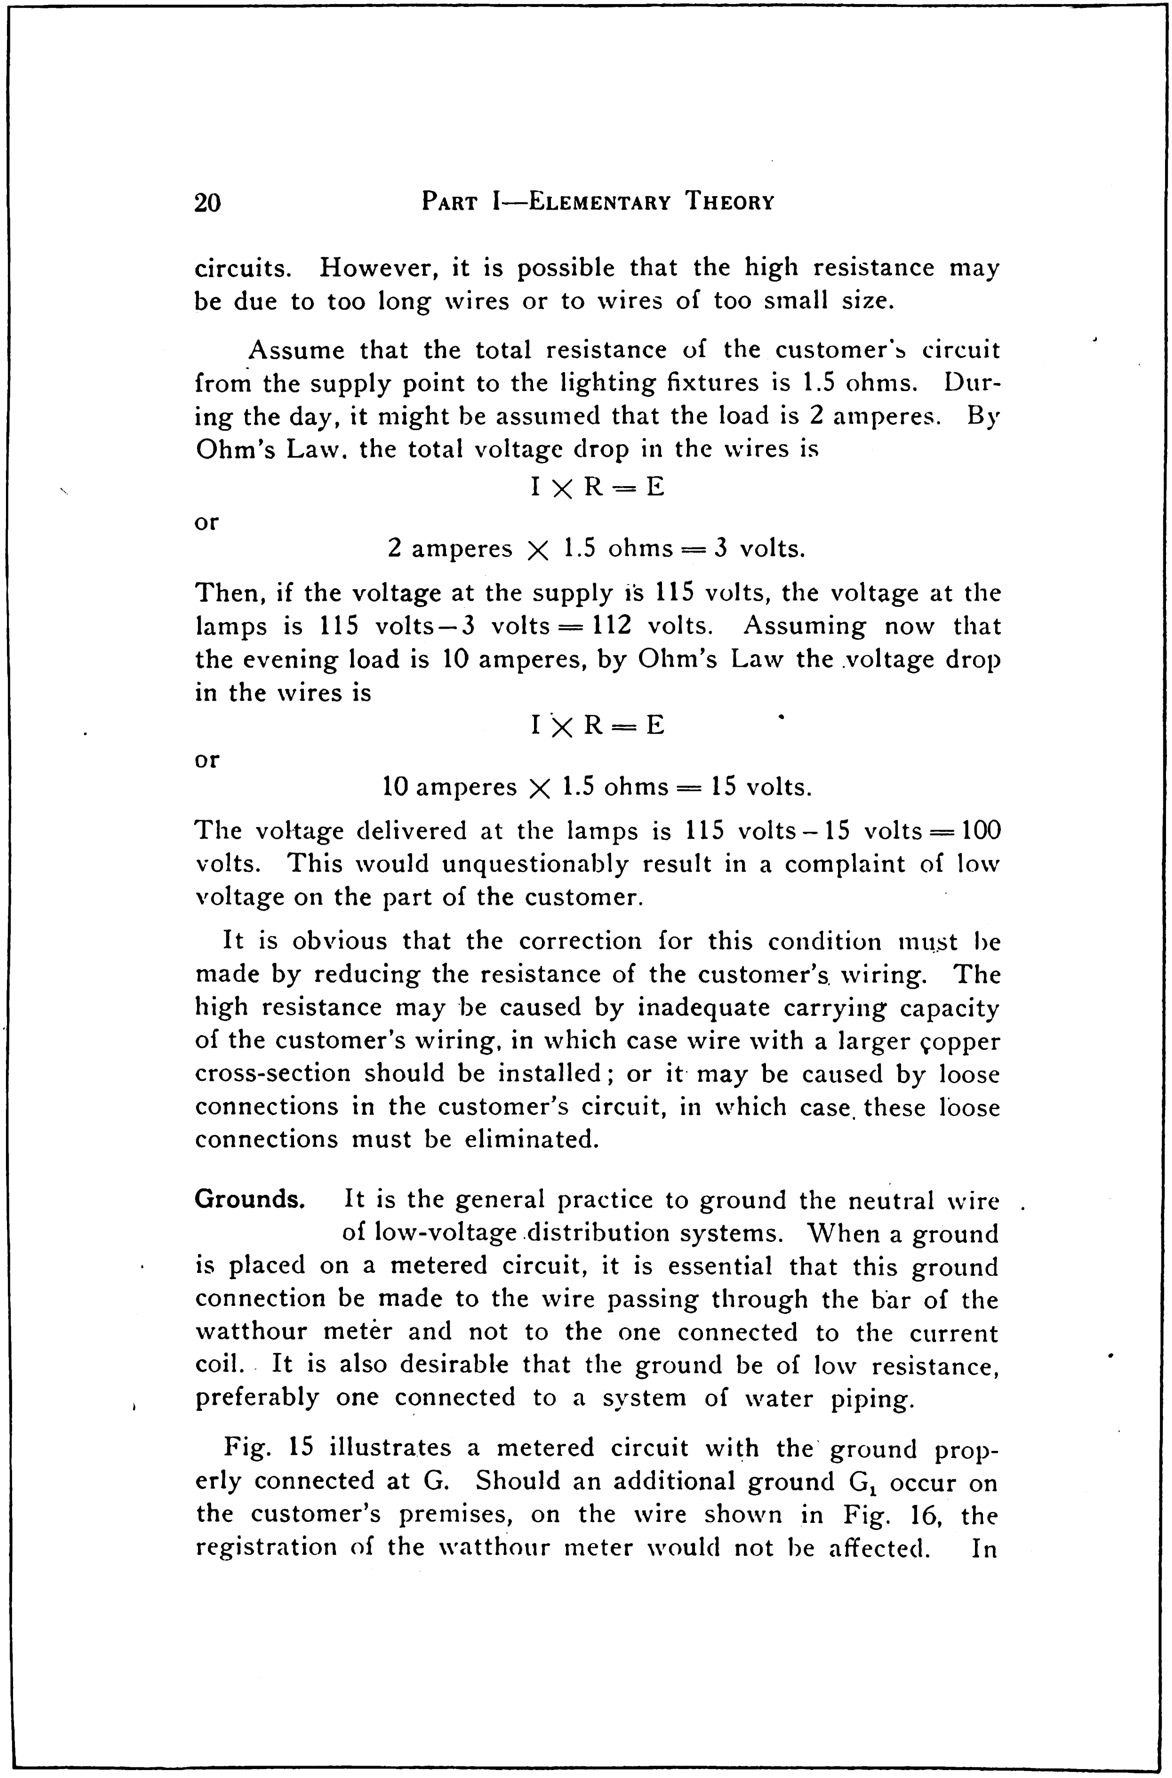
In addition there is included a supplementary booklet—Arithmetic for Electrical Metermen—which consists of a review of the arithmetic that is considered essential to a meterman.

Price for Parts 1 and 2 including correspondence service and certificate is $12.00.

Price for Parts 1 and 3 including correspondence service and certificate is $12.00.

Price for Parts 1, 2 and 3 including correspondence service and certificate is $18.00.

Descriptive folder giving full details and outline furnished upon application.



20 PART I—ELEMENTARY THEORY

circuits. However, it is possible that the high resistance may be due to too long wires or to wires of too small size.

Assume that the total resistance of the customer's circuit from the supply point to the lighting fixtures is 1.5 ohms. During the day, it might be assumed that the load is 2 amperes. By Ohm's Law, the total voltage drop in the wires is

$$I \times R = E$$

or

$$2 \text{ amperes} \times 1.5 \text{ ohms} = 3 \text{ volts.}$$

Then, if the voltage at the supply is 115 volts, the voltage at the lamps is $115 \text{ volts} - 3 \text{ volts} = 112$ volts. Assuming now that the evening load is 10 amperes, by Ohm's Law the voltage drop in the wires is

$$I \times R = E$$

or

$$10 \text{ amperes} \times 1.5 \text{ ohms} = 15 \text{ volts.}$$

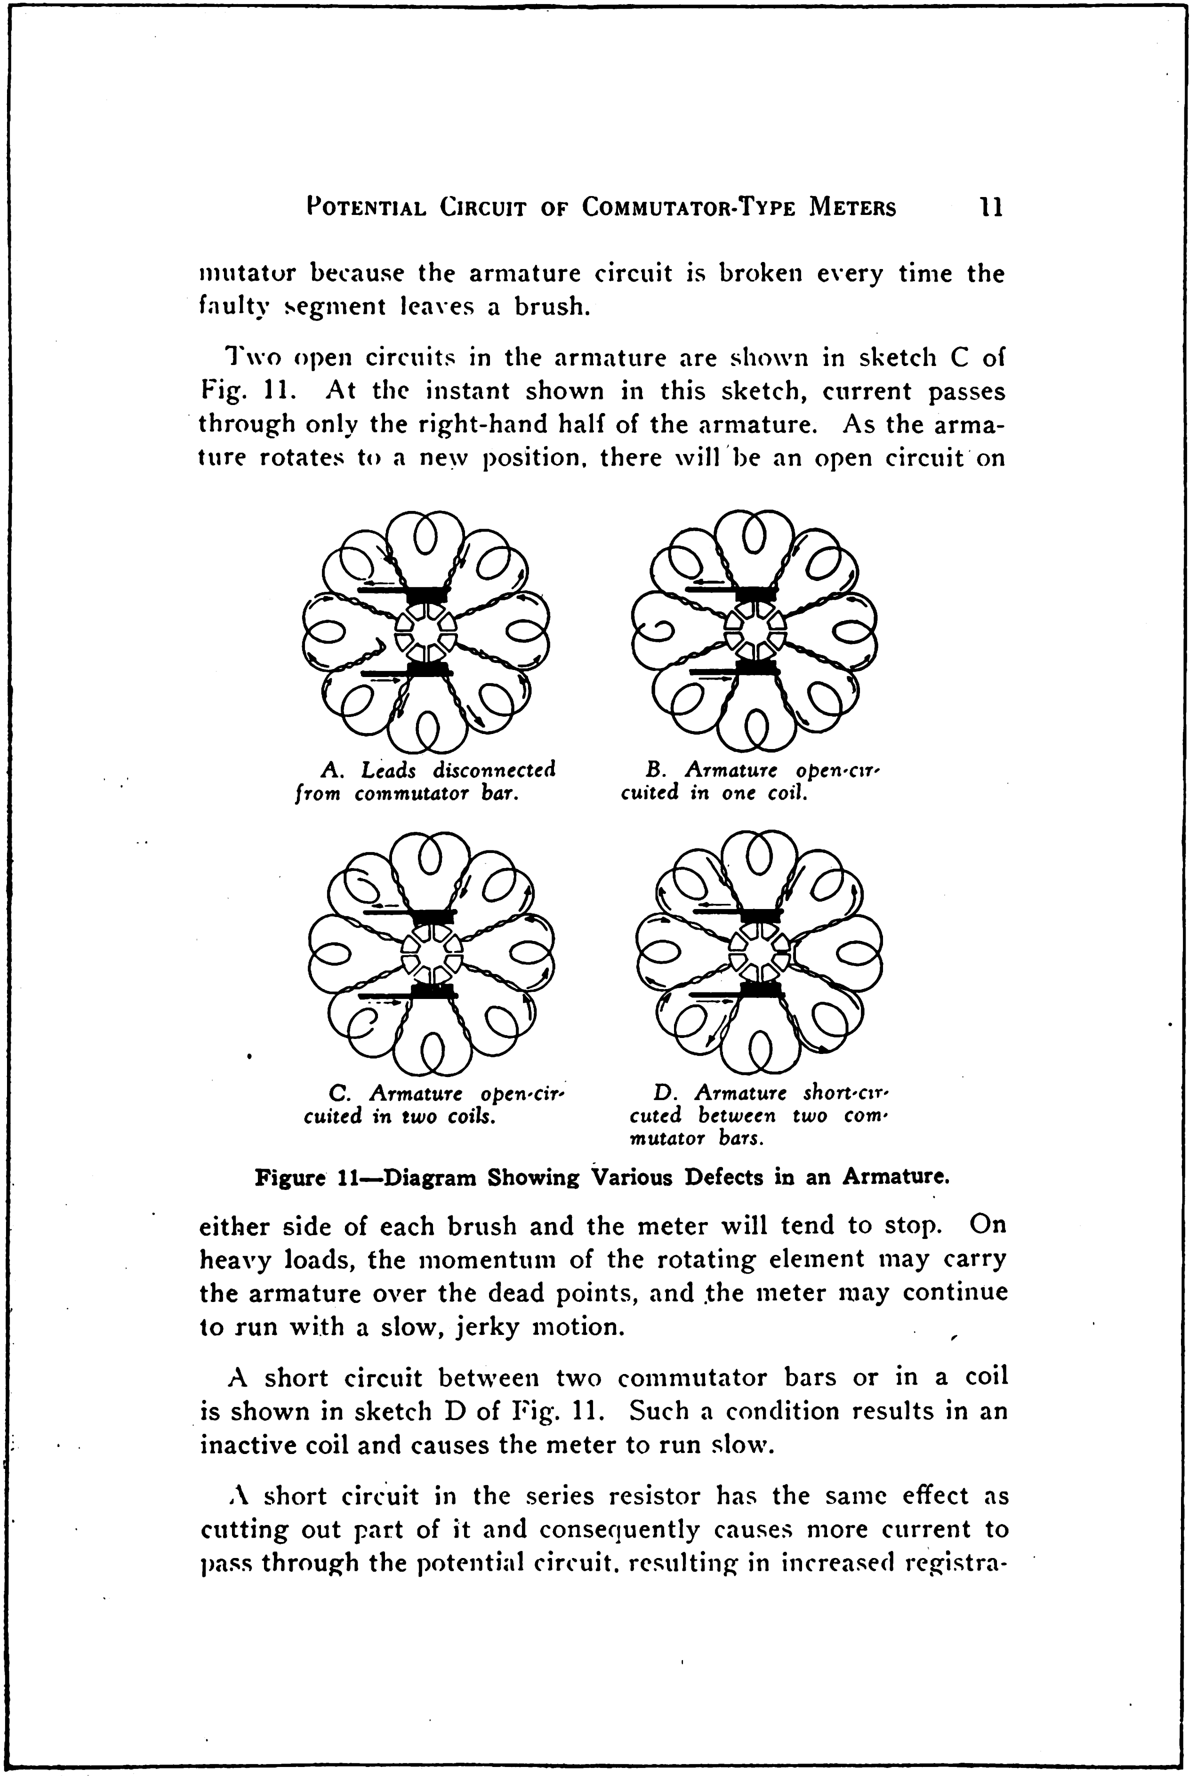
The voltage delivered at the lamps is $115 \text{ volts} - 15 \text{ volts} = 100$ volts. This would unquestionably result in a complaint of low voltage on the part of the customer.

It is obvious that the correction for this condition must be made by reducing the resistance of the customer's wiring. The high resistance may be caused by inadequate carrying capacity of the customer's wiring, in which case wire with a larger copper cross-section should be installed; or it may be caused by loose connections in the customer's circuit, in which case these loose connections must be eliminated.

Grounds. It is the general practice to ground the neutral wire of low-voltage distribution systems. When a ground is placed on a metered circuit, it is essential that this ground connection be made to the wire passing through the bar of the watthour meter and not to the one connected to the current coil. It is also desirable that the ground be of low resistance, preferably one connected to a system of water piping.

Fig. 15 illustrates a metered circuit with the ground properly connected at G. Should an additional ground G_1 occur on the customer's premises, on the wire shown in Fig. 16, the registration of the watthour meter would not be affected. In

FIG. 4—SAMPLE PAGE FROM PART 1 OF THE ELECTRICAL METERMEN'S COURSES.



POTENTIAL CIRCUIT OF COMMUTATOR-TYPE METERS 11

mutator because the armature circuit is broken every time the faulty segment leaves a brush.

Two open circuits in the armature are shown in sketch C of Fig. 11. At the instant shown in this sketch, current passes through only the right-hand half of the armature. As the armature rotates to a new position, there will be an open circuit on either side of each brush and the meter will tend to stop. On heavy loads, the momentum of the rotating element may carry the armature over the dead points, and the meter may continue to run with a slow, jerky motion.

A. Leads disconnected from commutator bar.

B. Armature open-circuited in one coil.

C. Armature open-circuited in two coils.

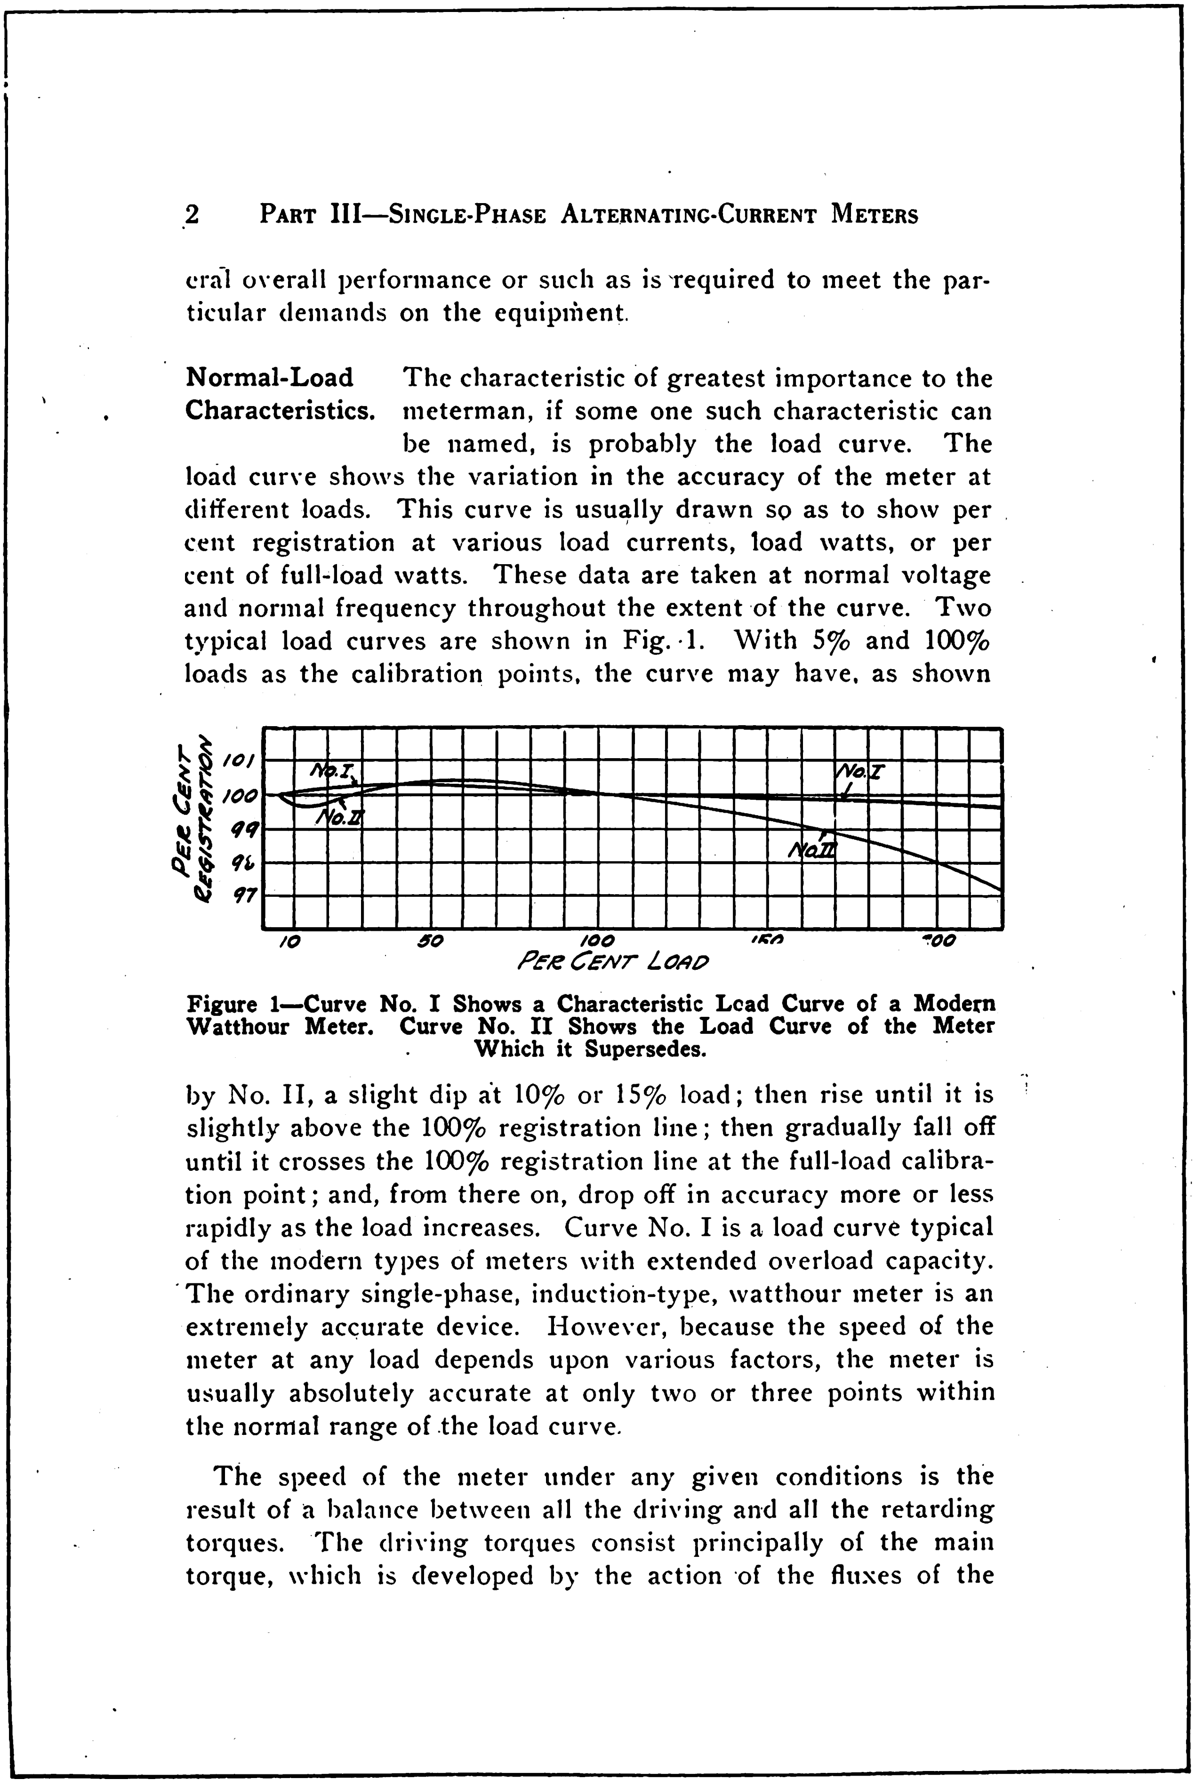
D. Armature short-circuted between two commutator bars.

Figure 11—Diagram Showing Various Defects in an Armature.

A short circuit between two commutator bars or in a coil is shown in sketch D of Fig. 11. Such a condition results in an inactive coil and causes the meter to run slow.

A short circuit in the series resistor has the same effect as cutting out part of it and consequently causes more current to pass through the potential circuit, resulting in increased registra-

FIG. 5—SAMPLE PAGE FROM PART 2 OF THE ELECTRICAL METERMEN'S COURSES.



2 PART III—SINGLE-PHASE ALTERNATING-CURRENT METERS

eral overall performance or such as is required to meet the particular demands on the equipment.

Normal-Load Characteristics. The characteristic of greatest importance to the meterman, if some one such characteristic can be named, is probably the load curve. The load curve shows the variation in the accuracy of the meter at different loads. This curve is usually drawn so as to show per cent registration at various load currents, load watts, or per cent of full-load watts. These data are taken at normal voltage and normal frequency throughout the extent of the curve. Two typical load curves are shown in Fig. 1. With 5% and 100% loads as the calibration points, the curve may have, as shown by No. II, a slight dip at 10% or 15% load; then rise until it is slightly above the 100% registration line; then gradually fall off until it crosses the 100% registration line at the full-load calibration point; and, from there on, drop off in accuracy more or less rapidly as the load increases. Curve No. I is a load curve typical of the modern types of meters with extended overload capacity. The ordinary single-phase, induction-type, watthour meter is an extremely accurate device. However, because the speed of the meter at any load depends upon various factors, the meter is usually absolutely accurate at only two or three points within the normal range of the load curve.

Figure 1—Curve No. I Shows a Characteristic Load Curve of a Modern Watthour Meter. Curve No. II Shows the Load Curve of the Meter Which it Supersedes.

The speed of the meter under any given conditions is the result of a balance between all the driving and all the retarding torques. The driving torques consist principally of the main torque, which is developed by the action of the fluxes of the

LIGHTING SALES COURSE
MERCHANDISE SALES COURSE
POWER SALES COURSE

Published for the Commercial National Section

The Educational Committee offers three specialized Commercial Courses covering Lighting, Merchandise, and Power Sales. These courses were prepared by specialists in their respective lines, and are published because of an increased demand for special courses on these three main branches of our business.

These courses are especially adapted for groups and classes of employees of commercial departments. They are also used generally in combination classes with employees of manufacturers, dealers, electrical contractors, and jobbers.

There never was a time in the history of our business when it was more necessary than now that the industry be represented by efficient, courteous, and well-trained salesmen.

Each course is divided into two parts. Part 1 is the same for all courses, and consists of five lessons on the principles of commercial engineering as required in our business. Part 2 of each course specializes in one of the above branches of commercial work.

Part 1

Lesson 1—Salesmanship
Lesson 2—Public Relations
Lesson 3A—Elements of Electricity
Lesson 3B—Elements of Electricity
Lesson 4—Principles of Rates
Lesson 5—Wiring for Light and Power

30 NATIONAL ELECTRIC LIGHT ASSOCIATION

1st. That the proposition is worthy.
2nd. That the prospect will be benefited.
3rd. That the company will be benefited.

No central station or other high-class salesman should try to sell a prospect anything that he considers unworthy. If you are convinced that the proposition is not worthy, then you are certain of failure for yourself and for the company as far as your sales are concerned. You must honestly endorse your proposition.

A central station salesman should endeavor to sell only where he knows the prospect will be benefited and satisfied, for therein lies the successful future for the central station. Remember that the satisfied customer is what you are after.

A central station salesman should not take business that he knows will not be satisfactory to the company, for if he does, he damages the future of both himself and the company.

Before trying to secure any piece of business, the salesman should study that branch of the business so that he can talk intelligently to the prospect, not only on the subject of motors, or light, or appliances, but also knowingly regarding their application to his particular needs. For example, of what use would a power salesman be, who knew all about motors, but nothing of wood-working plans? Very little. Could he talk to the manager or owner and secure his confidence, if he showed a lack of knowledge of wood-working machines and operation? We are sure you will agree he could not. But if he shows knowledge and intelligence, then only, can he hope for success.

This means that the successful salesman must be a broad man, ever on the alert to learn and increase his knowledge; for today it is a wood-working plant, tomorrow a machine shop, an ice plant, a packing house, or what not?

If the sale is an important one, involving a large expenditure of money, the proposition will usually be presented in typewritten form.

The typography of the proposition may vary in form from a short one page letter to a number of pages fastened in a flexible leather binder, with the customer's name in gilt on the cover. Each will seem equally absurd, if used with no appreciation of the requirements.

FIG. 7—Sample Page from Part 1 of the Lighting, Merchandise and Power Sales Courses.

32 NATIONAL ELECTRIC LIGHT ASSOCIATION

monly used where a very broad distribution of light is desirable as in the case of street lighting.

Since with both prismatic reflectors and refractors the light is reflected by or passed through clear glass only, the absorption is low and the efficiency of such glassware is of the highest order.

Opal-Glass Reflectors. Opal glass finds considerable application in illumination practice both as a reflecting and transmitting medium. In general there are two types of opal glass, classed as dense and light. The properties of opal glass can be most readily understood if we regard it as common glass, in which fine white particles are, so to speak, held in suspension. When a ray of light strikes this surface, part of the light is reflected directly, as in the case of a polished-metal surface. The remainder of the light travels through the glass in straight lines until it strikes the white particles, or any minute air bubbles which may be present, whence it is dispersed in all directions, some of it being thrown back and reflected as shown in Figure 20, A, and the remainder being transmitted through and out in all directions. If by chance any of the light passes through the glass and fails to strike any of the white particles, it goes out in a line parallel to the one along which it entered. Thus, if a lamp were enclosed in a ball of opal glass, through which on an average, say, one ray in a hundred could pass without strik-

MERCHANDISE SALES COURSE

PART II

LESSON I—ADVERTISING

Definition. **Advertising** includes all methods of publicity, word-of-mouth, printed matter, billboards, electric signs, window displays, etc.

In this lesson the discussion will be limited to printed advertising. Some of the other methods of advertising will be considered in later lessons.

Printed advertising is salesmanship on paper. It is salesmanship appealing to the mind through the eye, rather than through the ear.

Advertising is a means of educating the public, and like other educational work it must be continuous to be effective.

Salesmanship and Advertising. Practically all of the fundamental principles of salesmanship can be laid down as fundamental principles of advertising, inasmuch as you are appealing to the same persons, for the same object, only by a different method. The successful advertising man must be a good salesman, for the object of advertising is to sell. In addition he must, of course, be a master in handling the tools and materials used, i. e., language, paper, ink and know how to use them to accomplish the desired end. As the largest part of advertising is through printed matter, he must understand fully the printers' art.

FIG. 9—SAMPLE PAGE FROM PART 2 OF THE MERCHANDISE SALES COURSE.

Figure 4—Compound Motor Characteristics

The characteristics of a compound motor designed for crane service are shown in Figure 4. It will be noted that this motor has high torque but drooping speed. The motor will not run away when the load drops to zero as the strength of the shunt field is sufficient to limit the speed. This particular motor would be considered to be heavily compounded. By making the series field less strong a motor very similar to a shunt motor would be obtained except that it would have higher starting torque.

By connecting the series winding to act against the shunt winding we get a differentially compounded motor. This motor is little used as its only advantage is very close speed regulation. It has the serious disadvantage of trouble in starting. By attempting to start too rapidly, the sudden rush of current will cause the series winding to overpower the shunt winding, which will stall the motor and blow the fuses.

FIG. 10—Sample Page from Part 2 of the Power Sales Course.

DEVELOPING ELECTRIC SERVICE FOR THE FARM

AS EXEMPLIFIED BY THE ORGANIZATION AND METHODS OF THE WISCONSIN POWER AND LIGHT COMPANY

In order to make available practical information on how electric light and power companies may organize to develop electric service on the farm, the Rural Electric Service Committee has undertaken issuance of a series of reports which reflect in detail how this class of business is being handled by a number of companies.

This is the first of the series. It portrays in detail the rural electric service department of the Wisconsin Power and Light Co., Madison, Wis.; how it was organized; how it fits in with the rest of the organization; how it operates, and results achieved. In the near future similar reports regarding rural electric service departments in other companies will be issued.

It should be understood that the Rural Electric Service Committee of the National Electric Light Association in presenting these reports does not pretend to recommend the plan of organization and operation of any one company. It merely presents the methods of these companies for what they may be worth to others undertaking the organization and operation of such departments.

The Wisconsin Power & Light Company operates in 25 of the 71 counties of the State of Wisconsin, covering all of eight counties and parts of seventeen.

There is grown in this territory approximately 30 per cent of the canning peas, 60 per cent of the tobacco and 70 per cent of the dry beans produced in the State.

Farms served from company lines July 1, 1928	5,142

This is slightly over three times the number served Jan. 1, 1926.

Farms served through wholesale connections	2,150
Total farms served	7,292

This is 14.6 per cent of the farms in company territory.

Average kilowatt-hours per farm Jan. 1, 1928	52

The average energy consumption per farm has increased 44.4 per cent in two years.

The statistics given in Table I have been compiled from data made available by the Wisconsin State Department of Agriculture:

TABLE I

SIGNIFICANT AGRICULTURAL CHARACTERISTICS OF THE TERRITORY SERVED BY THE WISCONSIN POWER & LIGHT COMPANY

Area of territory	12,500 sq. miles
Number of farms	50,000
Average size of farm	125 acres
Farms operated by tenants	10,000
Farms having radio sets	23 per cent
Farms having running water in the house	13 per cent
Farms having furnaces	26 per cent
Number of cows	610,000
Average cows per farm	12
Average yearly milk production per cow	5,100 lb.
Number of silos	32,500
Number of cheese factories	830
Number of butter factories	160
Number of condenseries	30
Number of milk receiving stations	270
Number of swine	589,000
Average swine per farm	12
Annual egg production	30,000,000 doz.
Average annual egg production per farm	600 doz.
Canning peas	33,000 acres
Number of pea canneries	50
Tobacco	18,000 acres
Dry beans	8,500 acres
Pickle salting and receiving stations	80

ESSENTIALS FOR DEVELOPMENT OF RURAL ELECTRIC SERVICE

BY G. C. NEFF,
Vice-President, Wisconsin Power & Light Company

It should be clearly recognized that, primarily, rural electrification means electricity at work on the farm. A substantial current consumption per farm is necessary before either the farmer or the utility can realize potential possibilities. In this connection line building and the adding of farm customers are only necessary steps leading toward the final goal—an electrified agriculture.

To be successful in developing its farm load a utility company must be guided by executives who believe that farm electrification can pay its own way, that there is a load on the farm sufficient in amount to justify the expenditure which is required for distribution lines, that the farmers can afford to pay the necessary charges for this service, and that they can profit by its use. Aggressive executive support is essential.

Utility executives should appreciate that farm electrification is a big job, that it calls for the expenditure of large sums of money in distribution systems, and therefore should be willing to so organize their company that this large expenditure will be wisely made, and new business resulting from such expenditure will be profitable to both the utility and the farmer.

The farm electric service activities of the company should be carried on by a separate rural service department properly coordinated with the general operating organization and headed by an agriculturally trained man who reports to an operating executive who has a voice in developing the policy of the company, for in work of this kind many questions of policy will arise which require definite and prompt decisions.

The utility company should adopt an extension policy under the operation of which the utility will bear the cost of the entire farm distribution system under average conditions. This policy will not in any way impair the farmer's credit, which in many cases is needed to secure the equipment necessary to properly electrify his farm.

The utility company should develop and adopt a simple uniform rate schedule especially designed to meet farm conditions and so constructed that the farm customer who uses only a little energy must pay a relatively high price for the service rendered but not enough to make this low consumption profitable to the utility. Farm electrification cannot be developed on a permanent basis if the average consumption per customer is low, and it is desirable to bring this fact to the attention of both the farmer and the utility each month through the monthly bill. A proper rate schedule will do this and encourage the farmer and the utility company to cooperate in building the farm load.

The engineering department should be impressed with its responsibility in farm electrification development. It is essential that the first cost of farm lines be low so that they may be extended to reach the greatest number of farmers. However, the cost must be sufficient to provide durable lines which give close voltage regulation and few service interruptions. This is distinctly an engineering problem and offers the engineer an opportunity and responsibility in developing farm electrification.

A carefully thought out and thoroughly organized program to develop an appreciation of the possibilities of electric service on the farm among both the company's personnel and the farmers of the territory is essential. This program should be independent of merchandise sales, although coordinated with this activity.

A plan for merchandising the proper equipment to farmers should be developed. It should be easy for the farmer to secure the right equipment.

Company Organization and How Rural Service Department Was Fitted into This Plan

The Wisconsin Power & Light Company serves approximately 250 cities and villages in an area of 12,500 square miles located in central and southern Wisconsin. This territory is divided into four divisions. Each division organization is headed by a division manager who reports to the operating vice-president. Each division is divided into districts. The district organization is headed by a district manager who reports to a division manager. Service to the people in the entire 12,500 square miles of area is rendered through 18 district organizations. The general scheme of operation is to consider each district manager a general manager of all company activities in that district. Each division manager is considered as a general manager of all company activities in his division.

In addition to the organization just described there are 15 department heads who devote their entire time to some specific phase of the company's business. These department heads report to the operating vice-president. The department heads work directly with the people in the district offices who are actively carrying on the work in which the department head is interested. No department head can issue an executive order to any one in the field, but if the field

work is not satisfactory to the department head it is called to the attention of the vice-president, who works through the division managers and district managers and sees that such steps are taken as are necessary to bring about proper operating conditions. Such a plan permits of close contact between the department head and the field men and at the same time gives to each employee only one person from whom to receive orders.

The head of the Rural Service Department is one of the above described department heads, and his work is carried on in accordance with the above described plan. In each division office there is a man in charge of rural service work who is responsible to the division manager and who has charge of the rural service work in the division. With the exception of two of the small districts where the district manager personally takes care of the ural service work, each district has one or more district farm service men. These district farm service men work under the district managers.

The Rural Service Department is organized and functions in the same general manner as any other department of the company.

Organization Diagram

Fig. 2 shows the general organization of the company, and, in addition, shows in detail the Farm Service organization of the company.

Activities of the Rural Service Department

1. Took the responsibility for the development of a uniform set of rates and rules and regulations for rural service in cooperation with the Rate Department.

2. Conferred with farm leaders on the above matter.

3. Took an active part in presenting the rates, rules and regulations before the State Commission.

4. After adoption by the commission conducted an educational campaign among company employees and farmers for the purpose of explaining the new rates, rules and regulations.

5. Takes the initiative in the revision of rates, rules and regulations relating to farm service before the commission.

6. Looks after all complaints by farmers to the commission.

7. Interprets disputed points in the rules. Within the company the head of the Rural Service Department is the authority, with final appeal to the vice-president possible.

8. Distributes all commission rulings and interpretations and company interpretations with reference to rural service to division and district offices.

9. Canvasses rural customers on old rates with view to securing change to new schedule and arranges for refund when change is made.

10. Canvasses non-customers on established rural lines to sell them electric service.

11. Answers all inquiries from prospective rural customers, holds community meetings with interested farmers, canvasses all possible routes for new line extensions.

12. Secures easements for new rural lines, and in many instances stakes out and prepares the work order for new lines.

13. Keeps a check on new rural line construction to see that there is no undue delay between the signing of the application and the starting of service.

14. Lays out farm wiring systems, estimates wiring costs and in some instances takes contract for wiring installation.

15. Cooperates with merchandise department and dealers in the sale of equipment to farmers by:

(a) Thoroughly discussing with prospective customers possible uses of electricity and reporting prospects to proper place.

(b) When calling on old customers discussing further uses and reporting active prospects.

(c) Observation and comparison of different makes of equipment with recommendations as to what is best suited to needs of the territory.

(d) Cooperation with merchandising men in recommending equipment for special conditions and in making sales where considerable farm knowledge is required.

(e) Securing list of prospects from exhibitions, demonstrations, with addresses.

(f) Furnishing selling information to merchandising department.

(g) Cooperating with merchandising department in the preparation of sales literature and equipment advertising copy.

16. Cooperates with the Department of Public Information in the preparation of copy for general advertising and news releases on rural electrification.

17. Prepares for publication in the farm papers authentic, constructive articles on the rural uses of electricity.

18. Cooperates with the publishers of "Electricity on the Farm" in the preparation of editorial material. A copy of this publication is distributed to each rural customer each month.

19. Purchased and distributed, by personal call, to each rural customer a copy of C. R. E. A. Bulletin, Vol. IV, No. 1.

20. Keeps in touch with C. R. E. A. and all other known sources of information regarding the use of electricity in agriculture. Such information is distributed to the men in the company.

21. On the call of the vice-president of the company, held a series of meetings attended by division and district managers where the company's policies on rural electrification were discussed, the functions of the Rural Service Department explained, and means and methods for developing this business thoroughly discussed.

22. During the coming winter two of a series of district meetings to be attended by all company employees will be devoted to rural electrification. The

programs for these meetings will be in charge of the Rural Service Department.

23. Cooperation with State and National C. R. E. A., State, Division and National Committees of N. E. L. A., and other organizations for general advancement of the rural electrification movement.

24. At least an annual call on every rural customer to list all electrically operated equipment, make inquiry regarding satisfaction of service and discuss additional possibilities.

25. Service to individual farmers, particularly in reference to the selection and installation of equipment. Especial attention is paid to keeping installed equipment in proper operating condition. This has materially reduced emergency calls.

26. Exhibition and demonstration of electrical equipment at fairs and other gatherings. A demonstration truck is being prepared for rural use. Silo filling with a 5 h.p. motor will be shown at special demonstrations this year.

27. In some districts meter reading is done by the rural service men.

28. Recording the company's progress in rural electric development largely through the collection of statistics covering number of farms served, amount of current used, revenue, miles of line built, equipment used. All rural lines built are recorded on a map used only for this purpose.

Procedure in Establishing Service

The original application for electric service is entirely informal and usually consists of a call by some interested farmer, who inquires about rates and conditions under which extensions are made. If satisfied with explanation, he invariably represents his community as a particularly profitable place for the company to make an extension. "All those fellows will be big users," is the usual claim.

If the maps show that extension is feasible, company representative goes over the ground checking distances by speedometer and interviewing the farmers. If he finds the extension impracticable, the matter is dropped and the original inquirer is so notified.

But if there is sufficient interest, a meeting is called at a schoolhouse, church or home in the community. The whole project is discussed as a community enterprise and as applied to any prospect's special conditions. All hear the same story and realize that they are being treated alike. No special inducements or individual deals are made. At this meeting an approximate estimate of the probable cost of the extension is announced with a statement of the number of customers required to put it on free basis. Also the contributions required from customers if a smaller number are secured.

Where there is good chance of getting enough for free basis the original agreements are signed on this basis. As many as possible are signed at the meeting. Then a company man, preferably accompanied by a leading farmer, canvasses all of the remaining prospects, signing them up on a free basis.

If the number of signers multiplied by 400 is not less than the estimated cost of the line, the company proceeds to stake it out and prepare the work order. But if it is impossible to get this number of customers, the original agreements are taken back to the signers with a statement of the contribution needed to make up the deficit. The maximum amount of this contribution is definitely stated in an amended agreement for service.

Where the conditions make it obviously impossible to build an extension on a free basis, the contribution probably required is included in the original agreement. No customer should ever be asked for more than he has agreed to contribute. The estimate should take care of that.

The work thus far has been done by the rural man. If he has the engineering ability, he now stakes out the line and prepares the work order. Otherwise this is done by another representative from the district office.

Easements for the line are now secured from each property owner across or along whose land the line will pass. These legal documents must be signed before a notary, so some one in each district, often the rural man, holds such a commission. The easements are recorded by the Register of Deeds of the County in which the property lies.

The work order for a rural line extension is just like any other construction work order, and passes through the same routine, being approved by the district manager, division engineer, division superintendent, chief engineer, vice president and general manager and president. Accompanying it to the chief engineer's office, however, is a map showing it in relation to roads and all possible conflicts with lines of other utilities. This gives the engineering department the information needed in arranging for joint poles, transpositions, moving telephone lines, etc.

There is also a detailed description of the way the line will be built. This is made the basis of the Railroad Commission's permit to make the extension. A State highway man also goes over the line as staked out, learns how tree interference is to be avoided, to what extent anchors and crossings may interfere with the road and, finding these matters satisfactory or suggesting changes that will make them so, he gives the Commission's approval.

While these formalities are going on, the purchasing agent secures the necessary materials. Then, in accordance with some local or general program, construction begins. At the same time each individual customer lets a wiring contract either to the company or some contractor. The rural man may even secure the contracts and turn them over to a local contractor to fulfill, the company paying for the work and collecting from the customer. In any case, the rural man will decide and mark the spot on customer's premises at which the company's service drop will end.

When line construction and transformer installation is complete, connect orders are made in the local office for each customer. The meter department proceeds to carry out these orders. But if the meter man finds the premises wired in flagrant violation of company rules and the State Electrical Code he refuses to set the meter and calls the defects or dangerous conditions of the wiring to the owner's attention. This calls for corrections by the contractor.

When the meter is finally set, service begins. If the interval to the next meter reading date is not about one month, the service charge and first energy step are prorated on the first bill.

Rates and Contract Form for Rural Service

A few farms in all parts of the territory were formerly served by the smaller utilities now merged in the Wisconsin Power & Light Company. As each such company was purchased, its rural rates were continued until there were 69 different rates in effect. Aside from the resultant complications in billing and bookkeeping, this was a constant source of argument and irritation where neighboring farmers received identical service at quite dissimilar rates. The rates of many of these small companies were entirely inadequate. In some other cases, schedules were applied which were not at all fitted to farm conditions. Therefore, the creation of a new rural rate acceptable to the company, attractive to farmers, fitted to their needs, and uniform for all, was the first step in the extension of rural service.

In January, 1926, the Railroad Commission of Wisconsin held the first public hearing on the proposed uniform rural schedule. The farmers present opposed its approval on the grounds that in many cases it increased their bills, and that they did not fully understand the new features. The company, therefore, moved an adjournment to give the farmers time to organize for a thorough study of the proposed plan, and offered to place at their disposal its books and all of the cost data upon which the figures of the schedule were based. After adjournment the farmers organized and selected 100 representative delegates. At their first meeting these delegates elected a working committee of five with power to act for the larger group.

The committee secured all available literature on rural ratemaking and took up the study of the costs of service. Their most serious problem was the satisfactory allocation of these costs between large and small users of the service. Toward the end of each day's discussion they called a company representative into conference and presented their objections and counter-proposals to certain features of the schedule. At each session some of the objections were overcome and some of the farmers' suggestions were accepted.

During the same period the farmers throughout the territory were holding local meetings to discuss the same problems and to hear the reports from the working committee. These meetings were not under the auspices of the company, but representatives of the company were often invited to speak. Through them the farmers came to understand the difficulties of rural service and the company learned to appreciate the farmers' attitude. When, by concession and compromise, an agreement was reached between the company and the committee, the revised schedule was presented to the original 100 delegates and was approved by them. It was then submitted to the Railroad Commission of Wisconsin and was formally approved on June 21, 1926.

The working committee, in reporting its final action to the farmers, made the following statements:

> After many meetings, covering a period of a number of months, in which your committee gathered data from Canada and every State in the Union that has rural users of electricity, we consider that we now have the best farmers' rate, taking into consideration the territory it covers, that is in existence today.
>
> Electricity is going to be a big help to the farmer for light, power and heat. We recommend this rate as deserving of a fair trial. Take advantage of this contract and use as much electricity as you possibly can, for the more you use the less it costs you per kilowatt. Demand good service from the company, and we believe the results will be satisfactory.

The authors of this letter were originally elected to the committee because of their strong and active opposition to the company's proposal. The frank recommendation quoted above is typical of the support and cooperation which the new uniform rural schedule has received throughout the entire territory.

The company believes this method of establishing a new rate affecting thousands of people over an extended area and resulting in increased bills for a large number of them is unique. Its value from a public relations standpoint can hardly be overestimated. It is a method that any company can employ. The only requirements are a genuine desire to give real service fitted to the customer's needs, and a readiness to take the customer completely into the company's confidence and cooperate with him at every point.

This past spring further meetings were held with the farmers' committee for the purpose of simplifying the contract. The resulting contract and the Rules Governing Rural Extensions are shown in Fig. 3, 4, 5, 6 and 7.

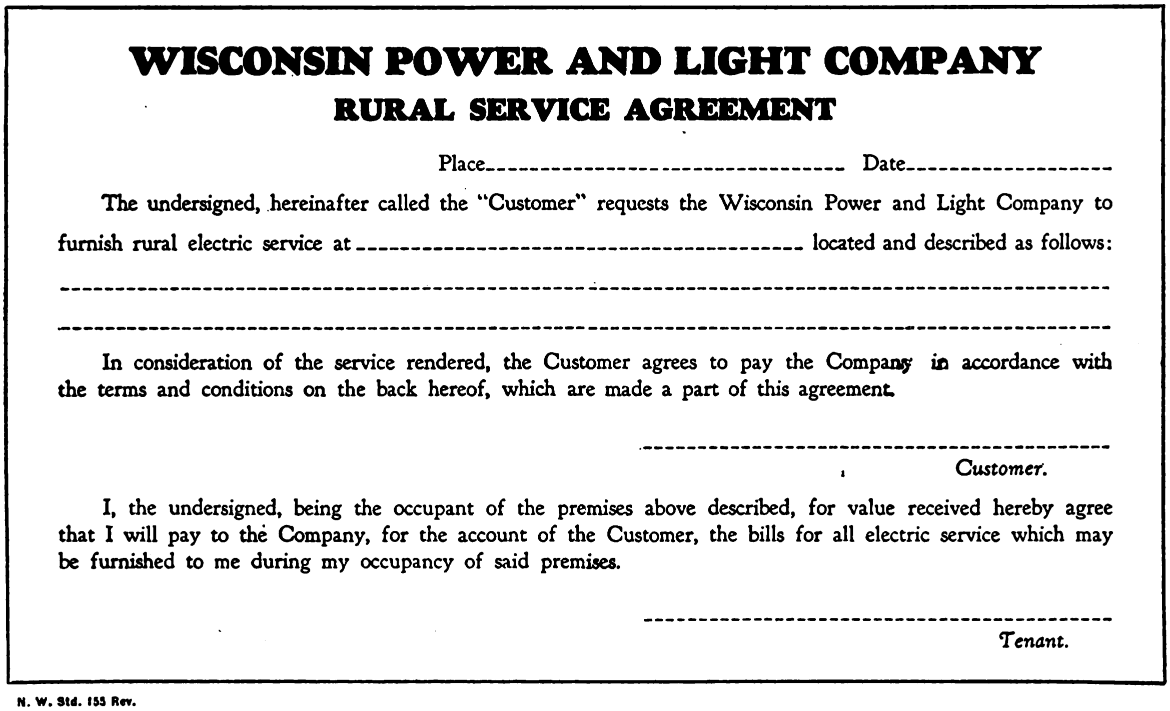
Rural Line Building

Rural lines are built by the regular local line crews, by special local line crews assigned to farm lines, or by construction department crews sent into a district for that purpose.

Whoever does the actual building, the staked-out project must be approved by a highway commission engineer. Efforts are made to apply for this approval far enough in advance so he can lay out a plan for his trips and inspect the greatest number of lines with the least inconvenience. Advance planning also allows the shifting of personnel where necessary.

The company owns three digging machines which are routed throughout the property for line building, including rural lines. Their efficient use demands a program of construction in which neighboring districts cooperate; also that the poles at least, and preferably the crossarms as well, be on the ground when the digger arrives.

The farmers have been employed to haul out the



WISCONSIN POWER AND LIGHT COMPANY

RURAL SERVICE AGREEMENT

Place................................ Date...................

The undersigned, hereinafter called the "Customer" requests the Wisconsin Power and Light Company to furnish rural electric service at .... located and described as follows:

....

....

In consideration of the service rendered, the Customer agrees to pay the Company in accordance with the terms and conditions on the back hereof, which are made a part of this agreement.

....

Customer.

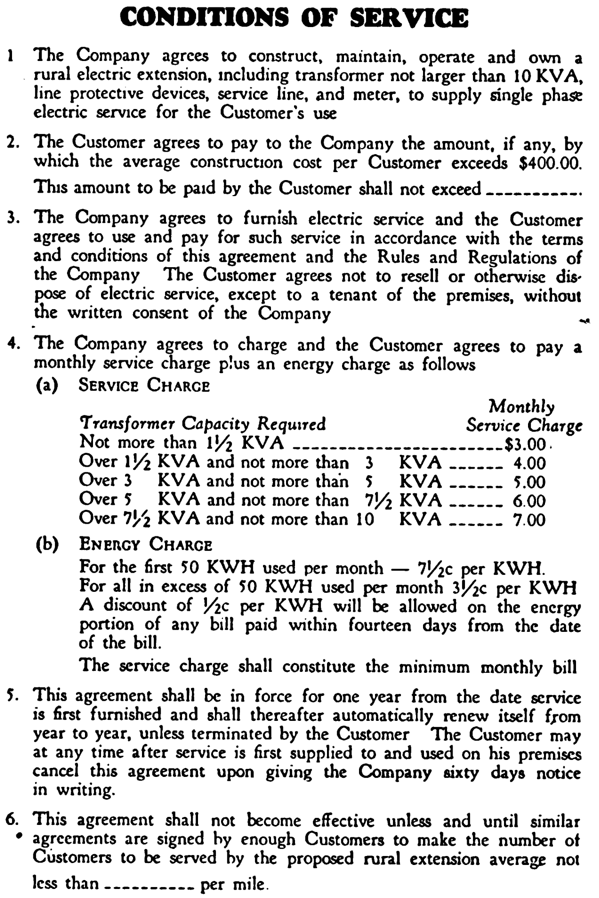
I, the undersigned, being the occupant of the premises above described, for value received hereby agree that I will pay to the Company, for the account of the Customer, the bills for all electric service which may be furnished to me during my occupancy of said premises.

....

Tenant.

N. W. Std. 153 Rev.

FIG. 3—RURAL SERVICE AGREEMENT, WISCONSIN POWER AND LIGHT COMPANY.



CONDITIONS OF SERVICE

1 The Company agrees to construct, maintain, operate and own a rural electric extension, including transformer not larger than 10 KVA, line protective devices, service line, and meter, to supply single phase electric service for the Customer's use

2. The Customer agrees to pay to the Company the amount, if any, by which the average construction cost per Customer exceeds $400.00.

This amount to be paid by the Customer shall not exceed ....

3. The Company agrees to furnish electric service and the Customer agrees to use and pay for such service in accordance with the terms and conditions of this agreement and the Rules and Regulations of the Company The Customer agrees not to resell or otherwise dispose of electric service, except to a tenant of the premises, without the written consent of the Company

4. The Company agrees to charge and the Customer agrees to pay a monthly service charge plus an energy charge as follows

(a) SERVICE CHARGE

Transformer Capacity Required	*Monthly Service Charge*
Not more than 1½ KVA	$3.00
Over 1½ KVA and not more than 3 KVA	4.00
Over 3 KVA and not more than 5 KVA	5.00
Over 5 KVA and not more than 7½ KVA	6.00
Over 7½ KVA and not more than 10 KVA	7.00

(b) ENERGY CHARGE

For the first 50 KWH used per month — 7½c per KWH.
For all in excess of 50 KWH used per month 3½c per KWH
A discount of ½c per KWH will be allowed on the energy portion of any bill paid within fourteen days from the date of the bill.

The service charge shall constitute the minimum monthly bill

5. This agreement shall be in force for one year from the date service is first furnished and shall thereafter automatically renew itself from year to year, unless terminated by the Customer The Customer may at any time after service is first supplied to and used on his premises cancel this agreement upon giving the Company sixty days notice in writing.

6. This agreement shall not become effective unless and until similar agreements are signed by enough Customers to make the number of Customers to be served by the proposed rural extension average not less than .... per mile.

FIG. 4—CONDITIONS OF SERVICE.

Rules Governing Rural Extensions

1. INTENT

These rules are intended to facilitate the securing of electric service in rural communities on such a basis as will stimulate the wide-spread use of electricity for heat, light, and power. In interpreting these rules, a rural extension should, so far as is practicable, be considered a community enterprise from which each individual customer will derive benefit through cooperation with all the other customers.

2. RURAL CUSTOMER DEFINED

For the purpose of these rules, a rural customer is defined as a purchaser of electric service (except customers of a class for which the Company has a suitable urban rate filed with the Railroad Commission) who can be adequately served from one transformer of not more than 10 Kva capacity; and who uses the service in the conduct of one enterprise, occupation, or institution, located outside the limits of a city or village or community with similar characteristics, at such distance that it cannot be adequately served from the secondary lines of the local distribution system.

3. RURAL EXTENSION DEFINED.

Rural extensions as herein used shall include all extensions to distribution systems built primarily to serve rural customers.

4. COST OF EXTENSION DEFINED

The construction cost shall include the costs of all materials, and the costs of all labor and other expense required for the distribution and installation of poles, wire, cross arms, insulators, line hardware, switching and protective devices, transformers, meters, appurtenances, right of way permits, etc.

An item not exceeding 10% of material costs shall be included to cover purchasing expense, freight, cartage to storeroom, and stores department expense.

An item not exceeding 15% of all above-mentioned costs shall be included to cover general overhead, engineering promotion, office supervision, clerical labor, contingencies, etc.

5. ANALYSIS OF EXTENSION

When one or more prospective rural customers make application for electric service the Company will investigate the extension, ascertain the number of customers who can be advantageously served, the number who will contract for service under the terms herein prescribed, and will estimate the construction cost as outlined in Rule 4, provided that, in the opinion of the Company, the extension is justified.

6. PAYMENTS BY CUSTOMERS

When the analysis of the proposed rural extension indicates that electric service is justified from both the Company's and the Customer's standpoint, the Company will execute with each prospective rural customer a contract setting forth the rates, terms, and conditions of service in substantially the form attached hereto.

If the number of contracts signed is such that the estimated cost of the extension will not exceed an average of $400.00 per customer, the Company will proceed to construct the extension at its own expense.

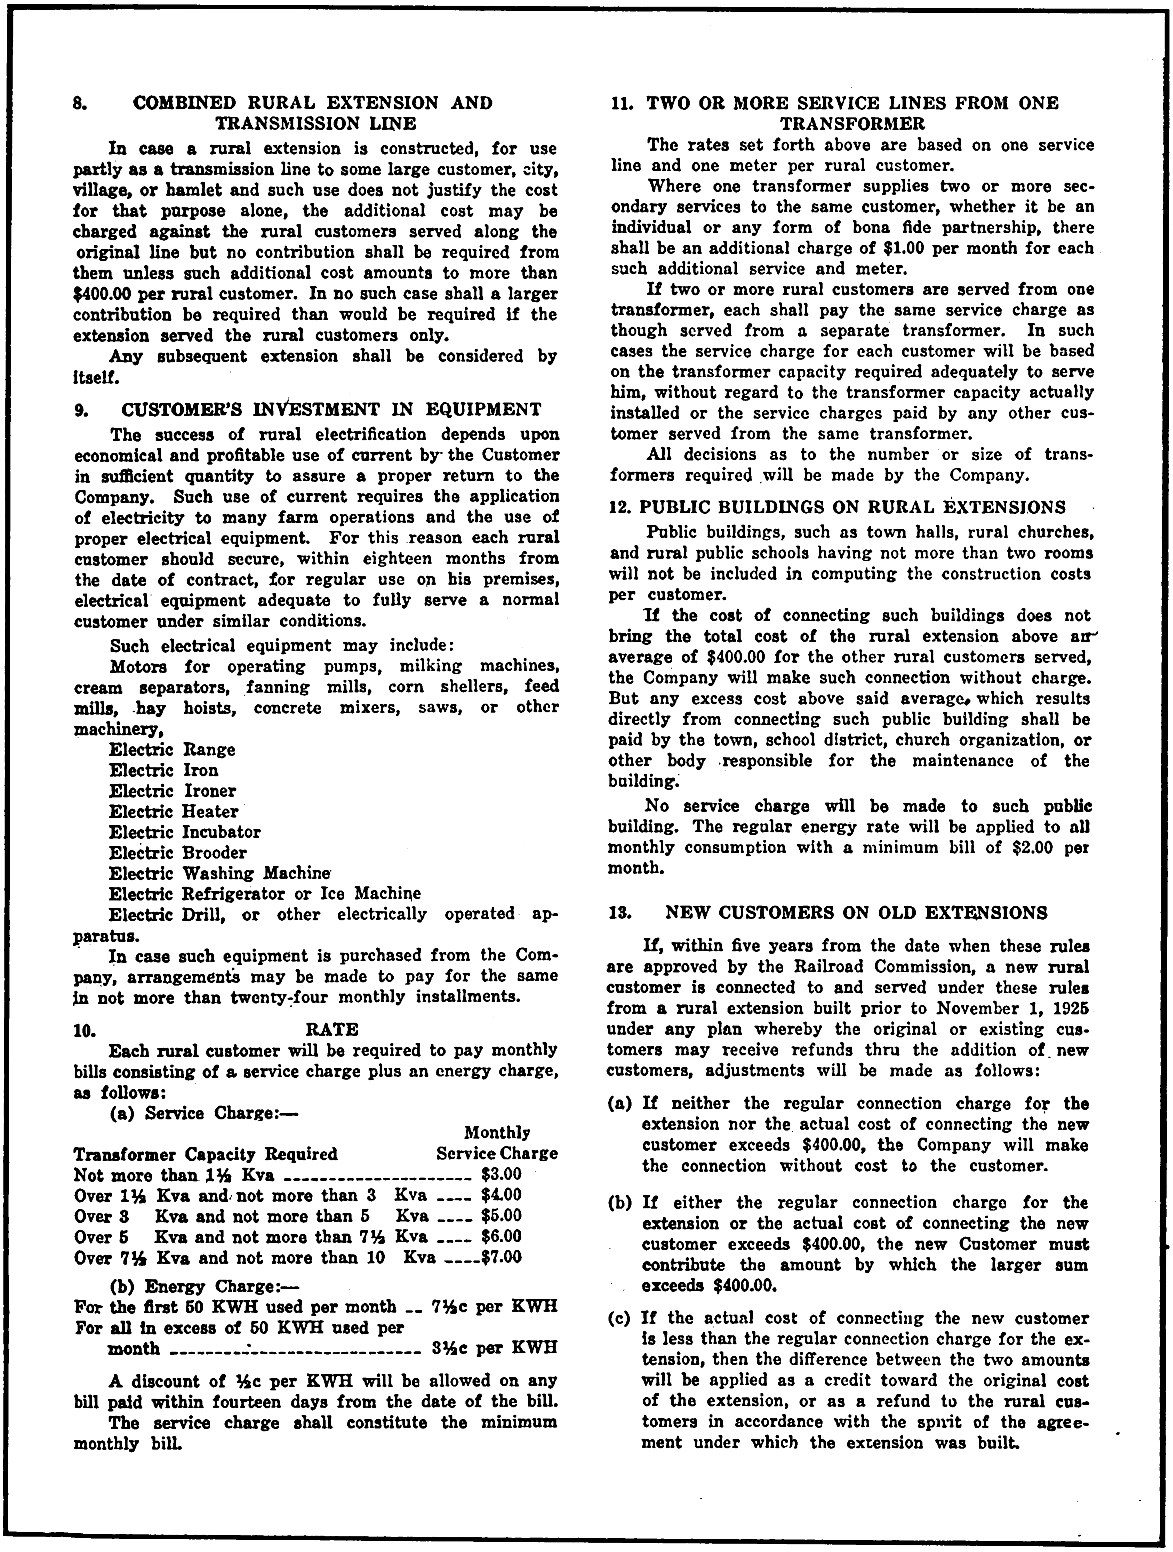
If the cost of the extension is estimated to be more than an average of $400.00 per customer, the amount by which said costs are estimated to exceed said average shall be contributed by the customers. One-half of such contribution shall be paid to the Company when the poles are set and the remainder shall be paid when service is available. The amount of the second payment shall be adjusted on the basis of the actual cost of construction above an average of $400.00 per customer.

7. ADDITIONAL CUSTOMERS

If, within five years from the date when service is first established on a rural extension, additional rural customers are connected to the extension, either directly, or by any branch from or addition to the extension, the cost of connecting them will be included in a new determination of the average cost per customer whenever such inclusion will lower the average cost per customer already served by the extension. In such cases the new customers shall pay to the Company and the Company shall refund to the customers already served such sums as will equalize all the customers' investment in the extension. No such redetermination shall be made as would tend to increase the contribution required from existing customers, but the additional customers shall contribute the amount by which the connection cost exceeds an average of $400.00 each.

If, within five years from the date when service is first established on a rural extension, an urban customer is connected to the extension at an actual connection cost less than the urban free limit as defined in the urban rules of the Company, then the difference between such actual cost of connection and the urban free limit shall be refunded to the rural customers served by the extension in proportion to the investment, if any, that each has in the extension.

FIG. 5—RULES GOVERNING RURAL EXTENSION—PAGE 1, WISCONSIN POWER AND LIGHT COMPANY.



8. COMBINED RURAL EXTENSION AND TRANSMISSION LINE

In case a rural extension is constructed, for use partly as a transmission line to some large customer, city, village, or hamlet and such use does not justify the cost for that purpose alone, the additional cost may be charged against the rural customers served along the original line but no contribution shall be required from them unless such additional cost amounts to more than $400.00 per rural customer. In no such case shall a larger contribution be required than would be required if the extension served the rural customers only.

Any subsequent extension shall be considered by itself.

9. CUSTOMER'S INVESTMENT IN EQUIPMENT

The success of rural electrification depends upon economical and profitable use of current by the Customer in sufficient quantity to assure a proper return to the Company. Such use of current requires the application of electricity to many farm operations and the use of proper electrical equipment. For this reason each rural customer should secure, within eighteen months from the date of contract, for regular use on his premises, electrical equipment adequate to fully serve a normal customer under similar conditions.

Such electrical equipment may include:

Motors for operating pumps, milking machines, cream separators, fanning mills, corn shellers, feed mills, hay hoists, concrete mixers, saws, or other machinery,
Electric Range
Electric Iron
Electric Ironer
Electric Heater
Electric Incubator
Electric Brooder
Electric Washing Machine
Electric Refrigerator or Ice Machine
Electric Drill, or other electrically operated apparatus.

In case such equipment is purchased from the Company, arrangements may be made to pay for the same in not more than twenty-four monthly installments.

10. RATE

Each rural customer will be required to pay monthly bills consisting of a service charge plus an energy charge, as follows:

(a) Service Charge:—

Transformer Capacity Required	Monthly Service Charge
Not more than 1½ Kva	$3.00
Over 1½ Kva and not more than 3 Kva	$4.00
Over 3 Kva and not more than 5 Kva	$5.00
Over 5 Kva and not more than 7½ Kva	$6.00
Over 7½ Kva and not more than 10 Kva	$7.00

(b) Energy Charge:—

For the first 50 KWH used per month	7½c per KWH
For all in excess of 50 KWH used per month	3½c per KWH

A discount of ½c per KWH will be allowed on any bill paid within fourteen days from the date of the bill.

The service charge shall constitute the minimum monthly bill.

11. TWO OR MORE SERVICE LINES FROM ONE TRANSFORMER

The rates set forth above are based on one service line and one meter per rural customer.

Where one transformer supplies two or more secondary services to the same customer, whether it be an individual or any form of bona fide partnership, there shall be an additional charge of $1.00 per month for each such additional service and meter.

If two or more rural customers are served from one transformer, each shall pay the same service charge as though served from a separate transformer. In such cases the service charge for each customer will be based on the transformer capacity required adequately to serve him, without regard to the transformer capacity actually installed or the service charges paid by any other customer served from the same transformer.

All decisions as to the number or size of transformers required will be made by the Company.

12. PUBLIC BUILDINGS ON RURAL EXTENSIONS

Public buildings, such as town halls, rural churches, and rural public schools having not more than two rooms will not be included in computing the construction costs per customer.

If the cost of connecting such buildings does not bring the total cost of the rural extension above an average of $400.00 for the other rural customers served, the Company will make such connection without charge. But any excess cost above said average, which results directly from connecting such public building shall be paid by the town, school district, church organization, or other body responsible for the maintenance of the building.

No service charge will be made to such public building. The regular energy rate will be applied to all monthly consumption with a minimum bill of $2.00 per month.

13. NEW CUSTOMERS ON OLD EXTENSIONS

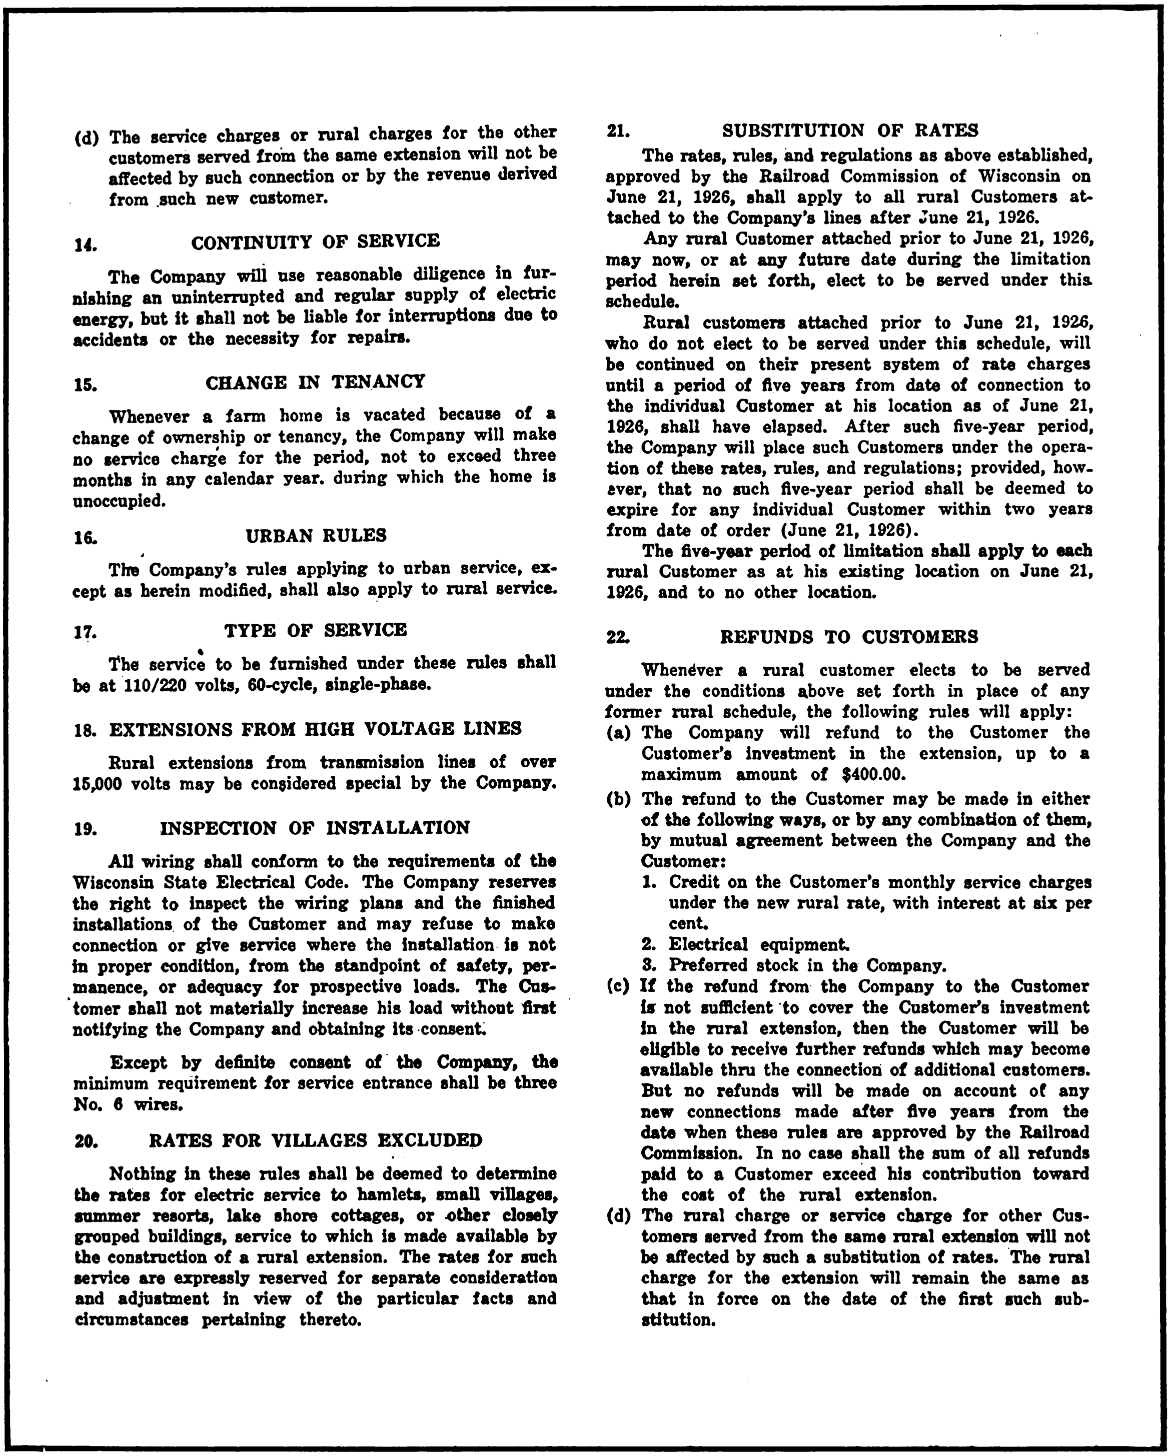
If, within five years from the date when these rules are approved by the Railroad Commission, a new rural customer is connected to and served under these rules from a rural extension built prior to November 1, 1925 under any plan whereby the original or existing customers may receive refunds thru the addition of new customers, adjustments will be made as follows:

(a) If neither the regular connection charge for the extension nor the actual cost of connecting the new customer exceeds $400.00, the Company will make the connection without cost to the customer.

(b) If either the regular connection charge for the extension or the actual cost of connecting the new customer exceeds $400.00, the new Customer must contribute the amount by which the larger sum exceeds $400.00.

(c) If the actual cost of connecting the new customer is less than the regular connection charge for the extension, then the difference between the two amounts will be applied as a credit toward the original cost of the extension, or as a refund to the rural customers in accordance with the spirit of the agreement under which the extension was built.

FIG. 6—RULES GOVERNING RURAL EXTENSION—PAGE 2, WISCONSIN POWER AND LIGHT COMPANY.



(d) The service charges or rural charges for the other customers served from the same extension will not be affected by such connection or by the revenue derived from such new customer.

14. CONTINUITY OF SERVICE

The Company will use reasonable diligence in furnishing an uninterrupted and regular supply of electric energy, but it shall not be liable for interruptions due to accidents or the necessity for repairs.

15. CHANGE IN TENANCY

Whenever a farm home is vacated because of a change of ownership or tenancy, the Company will make no service charge for the period, not to exceed three months in any calendar year, during which the home is unoccupied.

16. URBAN RULES

The Company's rules applying to urban service, except as herein modified, shall also apply to rural service.

17. TYPE OF SERVICE

The service to be furnished under these rules shall be at 110/220 volts, 60-cycle, single-phase.

18. EXTENSIONS FROM HIGH VOLTAGE LINES

Rural extensions from transmission lines of over 15,000 volts may be considered special by the Company.

19. INSPECTION OF INSTALLATION

All wiring shall conform to the requirements of the Wisconsin State Electrical Code. The Company reserves the right to inspect the wiring plans and the finished installations of the Customer and may refuse to make connection or give service where the installation is not in proper condition, from the standpoint of safety, permanence, or adequacy for prospective loads. The Customer shall not materially increase his load without first notifying the Company and obtaining its consent.

Except by definite consent of the Company, the minimum requirement for service entrance shall be three No. 6 wires.

20. RATES FOR VILLAGES EXCLUDED

Nothing in these rules shall be deemed to determine the rates for electric service to hamlets, small villages, summer resorts, lake shore cottages, or other closely grouped buildings, service to which is made available by the construction of a rural extension. The rates for such service are expressly reserved for separate consideration and adjustment in view of the particular facts and circumstances pertaining thereto.

21. SUBSTITUTION OF RATES

The rates, rules, and regulations as above established, approved by the Railroad Commission of Wisconsin on June 21, 1926, shall apply to all rural Customers attached to the Company's lines after June 21, 1926.

Any rural Customer attached prior to June 21, 1926, may now, or at any future date during the limitation period herein set forth, elect to be served under this schedule.

Rural customers attached prior to June 21, 1926, who do not elect to be served under this schedule, will be continued on their present system of rate charges until a period of five years from date of connection to the individual Customer at his location as of June 21, 1926, shall have elapsed. After such five-year period, the Company will place such Customers under the operation of these rates, rules, and regulations; provided, however, that no such five-year period shall be deemed to expire for any individual Customer within two years from date of order (June 21, 1926).

The five-year period of limitation shall apply to each rural Customer as at his existing location on June 21, 1926, and to no other location.

22. REFUNDS TO CUSTOMERS

Whenever a rural customer elects to be served under the conditions above set forth in place of any former rural schedule, the following rules will apply:

(a) The Company will refund to the Customer the Customer's investment in the extension, up to a maximum amount of $400.00.

(b) The refund to the Customer may be made in either of the following ways, or by any combination of them, by mutual agreement between the Company and the Customer:

1. Credit on the Customer's monthly service charges under the new rural rate, with interest at six per cent.
2. Electrical equipment.
3. Preferred stock in the Company.

(c) If the refund from the Company to the Customer is not sufficient to cover the Customer's investment in the rural extension, then the Customer will be eligible to receive further refunds which may become available thru the connection of additional customers. But no refunds will be made on account of any new connections made after five years from the date when these rules are approved by the Railroad Commission. In no case shall the sum of all refunds paid to a Customer exceed his contribution toward the cost of the rural extension.

(d) The rural charge or service charge for other Customers served from the same rural extension will not be affected by such a substitution of rates. The rural charge for the extension will remain the same as that in force on the date of the first such substitution.

FIG. 7—RULES GOVERNING RURAL EXTENSION—PAGE 3, WISCONSIN POWER AND LIGHT COMPANY.

poles, particularly in winter, and in a few cases where a contribution was required of them they have made it in labor. But in general the use of farm labor for line building is not considered very efficient.

The work in all districts and by all types of labor is performed according to very detailed and definite rural line specifications. These call for a line of rather high quality, looking toward the greatest efficiency and economy over a period of many years.

The lines now being built are 6600-volt, single-phase; 6600-volt, 3-phase, or 11,400-volt, 4-wire, in any case giving the rural customer single-phase service.

Service to Farm Customers

Shortly after the Rural Service Department was organized, one traveling repairman and counselor was employed to assist farmers in making the most economical and beneficial use of electric service. This man reported to the head of the department. He received no commission and he sold no merchandise except lamps, which he carried for the accommodation of the customers.

He fixed all equipment and apparatus that could be adjusted or repaired in a few minutes on the premises, charging only for the replacement parts —nothing for time or labor. In more serious difficulties, such as rewinding motors or re-slotting commutators, he advised the most economical remedy. He was able to forestall the failure of hundreds of pieces of equipment before they gave serious trouble, to put back in service at little or no cost to the owner idle appliances amounting to about 250 watts per day, and daily sold an equal wattage of lamps.

While this form of activity was successful in many ways, it soon became evident that this type of service should be under the immediate control and direction of the district office, and such a change was made.

Meter Reading

To provide another opportunity for contact with the rural customer, the practice of actually reading rural meters every month has been adopted. In some districts this is still done by a meter department employee. But it offers such a good opportunity for combination with the service work mentioned above that it is becoming a part of the rural man's duties.

In fact, this tendency is just another step in the experiment now being tried of having one man make all personal contact with the farmer and his family.

Developing an Appreciation of Electric Service on the Farm

If rural electric service is to be made successful, there are two distinct fields, viz.: in the company organization and among farmers, for the development of an appreciation of the possibilities.

In the Company

It is important that the entire management of a utility organization should believe in farm electrification if much headway is to be made in this development. The farmers who deal with such an organization will soon recognize the sincerity of its aims from the attitude of the individuals who represent it. As a result there is developed between the farmers in the territory and the people of the utility company a feeling of confidence which is valuable and necessary to satisfactory farm electrification. It is, therefore, one of the jobs of the principal executives of a company to see to it that the entire organization of the company fully understands the objectives of the company as regards rural electric service and to give sufficient information to convince them that farm electrification is worth developing and will pay its own way.

At the time the Wisconsin Power & Light Co. began intensive work on farm electrification, the division and district managers and department heads of the company were called in to a meeting and the entire plan of procedure as regards farm electrification was explained in detail. A full discussion of all points was encouraged, with the result that at the end of two days everyone in attendance at the meeting was convinced that farm electrification could be made profitable to both the farmers and the company, and that it was advisable from every viewpoint to bring about general farm electrification as rapidly as possible.

As the farm electrification program developed it was found that from time to time there were new problems arising which called for consideration, and in order to keep in close touch with these new problems and to get the benefit of the ideas of the men in the field there was created in the Wisconsin Power & Light Co. a rural service committee, made up of district managers, one division manager and members of the rural service department. This committee meets at least four times a year, oftener if necessary, and discusses the new problems which have arisen in this development, and recommends such changes as it thinks desirable in the plan of procedure. These recommendations are presented to the department head and district and division managers' meetings, which are held quarterly, and here the recommendations are discussed and finally voted on by this organization. They then need, of coure, the approval of the chief executives of the company before any changes are made. This form of procedure, however, makes the entire management familiar with and holds their interest in farm electric development.

Among the Farmers

In a previous chapter the story has been told of how one uniform farm rate was substituted for a multiplicity of farm rates which had prevailed in the territory served by the Wisconsin Power & Light Co.; of how the farmers held mass meetings, organized, appointed a committee, negotiated with the company, and how a mutually harmonious conclusion was arrived at approved by the State regulatory commission.

This attainment of a uniform rural rate mutually satisfactory to company and customers was by no means the only achievement brought about by these negotiations, mass meetings, and the work of the farmers' committee. The entire experience proved of inestimable educational value to everyone who participated, and imparted to everyone a working knowledge, not only of rates but of the modern-day idea of the application of electricity to agriculture.

Since the establishment of this rate the company has continued its educational activities in an orderly way, as follows:

Talks on "What Electric Service Is Doing for Wisconsin Farmers," given in rural homes, schoolhouses and halls at meetings of Parent-Teachers Associations, Farm Bureau, Co-operative Marketing Groups, Church Societies and unorganized meetings called for that purpose.

Advertisements in the State agricultural papers on the general advantages of electric service.

During the past year a uniform series of 2-column by 8-in. advertisements, each one dealing with a single important use of electricity were run in 53 local weekly papers in the territory. Twelve different advertisements were run in each paper.

Feature stories on actual farm experiences, the results of tests, how to install or operate electrical equipment and other helpful information are submitted to farm papers having the widest circulation and the strongest influence in the territory. Because these stories are of interest and genuine benefit to farm readers, because every statement contained can be verified, and because the stories are scrupulously free from company or appliance advertising, the most conservative agricultural editors seem glad to publish them.

Last year a 3-pole tent, 20 ft. by 40 ft., was purchased to shelter an agricultural exhibit at a series of county fairs. The exhibit represented a dairy and a kitchen interior and an outdoor scene, and the appropriate equipment was in actual operation. This year at 10 or 12 fairs the emphasis will be on shallow and deep well water systems, feed grinding and silo filling with 5 h.p.

A copy of C. R. E. A. Bulletin, Volume IV, Number 1, was given to each farm customer by a company representative. Each month the publication, "Electricity on the Farm," is distributed to farm customers. Literature published by manufacturers is also distributed.

There is being developed a number of demonstration farms in the different divisions of the territory. With the increasing use of electricity on the farm these demonstration farms do not promise to be as important as was originally anticipated.

Demonstrations of cooking, feed grinding, silo filling and water pumping have been made on farms. Other operations will be demonstrated as conditions warrant.

A demonstration truck, on which important uses in operation will be featured, is being built.

Selling Equipment

Selling merchandise is one of the important activities of the company, and the value of the rural market is beginning to be appreciated. All selling is in charge of the merchandise department. For selling to farmers special salesmen who really understand modern farming are being selected and developed. In some districts these salesmen themselves are the rural representatives and, therefore, do other rural promotion work. This is in line with the policy of combining rural duties in one man.

The rural department cooperates with the merchandise department as follows:

1. First of all, in selecting good merchandise for resale. That is, equipment that will stand the gaff of farm service.
2. In furnishing to the salesmen data on capacity, electric consumption, recommended operating conditions and advantages of farm equipment for sales talk.
3. In reporting prospects.
4. By making specific recommendation for a particular machine and especially for its installation and operation to fit an individual farmer's conditions.

To farmers the generally accepted line of household appliances are sold, plus outdoor equipment of which the electric feature is an integral part, such as water systems, brooders, etc. The company also features the introduction of machines newly adapted to the electric drive. Hammer mills and hay hoists are good examples. It does not sell other farm machinery that is already well established through implement dealers. For instance, the electric drive of milking machines is very common, but the company does not sell them. The company also feels that the implement trade should handle the silo filler, though it cooperates in showing its adaptation to electric drive.

The selling is done through the following-up of leads and the investigation of prospects reported, rather than by straight house-to-house canvassing.

A cooperative arrangement with plumbers and electrical dealers is carried out by special agreements. Salesmen from the manufacturers of water systems, pump jacks, hammer mills and motors often go with the company's salesmen to finally close sales.

Pumping with various forms of outfits is perhaps the most popular farm use. In the farm house probably more irons are sold than any other item. Range sales are also increasing. Motors ranging from ½ h.p. to 5 h.p. are sold in considerable numbers; they are used for a wide variety of purposes.

The Ideal Arrangement

The ideal arrangement for dealing with rural customers is to have as few men as possible who come in contact with them. That is, to let the same man handle all matters pertaining to rural service in a certain area. This practice decreases the expense of reaching the rural customers for meter reading, service calls, trouble calls, merchandise sales, stock sales, complaints, information on new equipment or advice and help on new installation. It avoids useless irritation with so-called "canvassers" or "peddlers."

It creates customers' confidence in the rural man and allows him to get better acquainted with their problems. It avoids having to refer questions and problems from man to man, which looks to the customer like "passing the buck."

For these reasons the company is working toward this arrangement. The shifting of service work from the general office to the districts was such a step.

Cooperation with Other Agencies

1. Definite cooperation with other agencies in the State and national C. R. E. A. work.
2. Cooperation with Wisconsin Utilities Association, Rural Lines Committee and its activities outside C. R. E. A.
3. Direct cooperation with the College of Agriculture in:
    - (a) Rural electrification short course designed mainly for utility employees.
    - (b) Farmers' and home-makers' week.
    - (c) Farmers' institutes.
    - (d) Supplying statistics and other data and receiving suggestions and advice on special problems.
4. Cooperation with the manufacturers of machinery in demonstrating their product. Silo fillers are the most important example.
5. Cooperation with customers and prospects in the sale of their individual light plants.
6. Continued cooperation with the farmers' committee elected to represent the customers when the uniform rate was established. They are consulted on proposed innovations, such as a direct-mail advertising campaign.

Results

The company has a farm policy.

The company has an organization to further develop and execute this policy. As far as the company is concerned, the "farm problem" has entirely changed. Instead of "What to do with it," the main problem now is "How to Build the Load."

The idea that electric service is possible and practical for the farmer is established with the company personnel and with a majority of the farmers in the company's territory.

The company has a good start on a plan for merchandising equipment to farmers.

Sixty-nine different rates for farm service have been superseded by one rate for farm service applicable throughout the company's territory, and this rate was agreed to by a committee representing the farm customers of the company.

The development of the farm business has become regular routine in just the same manner as the development of any other line of new business.

The officers of the company are convinced that a farm rate and a farm organization within the company are essential to success.

The farmers have respect for and confidence in the recommendations of the men in the rural service department.

The number of farm customers is increasing.

The average energy consumption per farm is increasing.

Farms served from company lines, Jan. 1, 1926	1,624
Farms served from company lines, Jan. 1, 1927	3,146
Farms served from company lines, Jan. 1, 1928	4,308
Farms served from company lines, July 1, 1928	5,142
Farms served through wholesale connections, July 1, 1928	2,150
Total farms served July 1, 1928	7,292
Per cent of farms in territory served July 1, 1928	14.6
Increase in number of farms served, Jan. 1, 1926, to Jan. 1, 1928	165%

Use of energy by rural customers	Kw-hr. per month per customer
1925	36
1927	52

Average increase in energy consumption over two-year period	44.4%

During 1926 and 1927 the number of customers increased by 165 per cent of the number at the beginning of that period. Not only a large number but a very large proportion of the customers, included in making up the average consumption figures, are, therefore, new customers. Only one, two or three months' meter readings have been recorded for some of them. The expense of wiring the premises had doubtless absorbed much of the ready cash in many cases, so that they had purchased little electrical equipment. Consumption records show that it normally takes many months for the average farm customer to "hit his stride" in using the service. The increased use of energy by the relatively small group of older customers is not apparent in the figures because of the large percentage of beginners.

For customers who have been served at the uniform rural rate (which encourages use) for a year and a half or more, connected prior to Jan. 1, 1927, the average use per month is estimated to be nearly 100 kw-hr.

Rural Electric Service in Alabama

By Thomas W. Martin, *President*
Alabama Power Company

ALABAMA POWER COMPANY, within the past few years, has invested more than $2,000,000.00 to enable it to furnish rural electric energy and is now serving more than 6000 Alabama farmers. This statement is made with considerable pride for back of it are plans, purposes and efforts that have been an integral part of the Company's life and growth.

Our trade slogan—"Serving Farm, Factory and Fireside"—puts the farm in a leading place in the Company's ideal of service. In working to this ideal, the necessities of sound financing and healthy growth, governing our Company as they do all succcessful utilities, required that the service be first extended to cities and thickly populated industrial centers. As these objectives were attained, it was possible to widen the circle and reach farther and farther into the rural sections. This was most opportune for farm life needed a revivifying touch if a balanced ratio between agricultural and industrial pursuits, urban and rural life, was to be maintained.

Electrified farm operation was the contribution the Company began to make and is making towards the relief of this situation. A happy and prosperous, contented and progressive farm home radiates a beneficent and inspiring influence that is reflected in the life of the entire State as well as in the local community. Abundant electric energy at reasonable rates, by removing household drudgery, making profits possible and by affording leisure for the enjoyment of the cultural agencies it brings, gives the farmer the opportunity to have such a home.

The use of household appliances on the 256 lines now in operation is quite general. The application of electric power in farm operations is constantly increasing in scope, as evidenced by the installations being made.

While our rural power revenue is not as yet making a satisfactory return on the investment, we are quite hopeful that the business will be built up to self-sustaining proportions within a reasonable time. Viewing this work from both the economic and social standpoint, we feel fully justified in continuing it as an integral part of our program of service, confident that it is contributing to the prosperity of Alabama.

DEVELOPING ELECTRIC SERVICE FOR THE FARM

AS EXEMPLIFIED BY THE ORGANIZATION AND METHODS OF ALABAMA POWER COMPANY

In order to make available practical information on how electric light and power companies may organize to develop electric service on the farm, the Rural Electric Service Committee has undertaken issuance of a series of reports which reflect in detail how this class of business is being handled by a number of companies.

This is the second of the series. It portrays in detail the rural electric service department of the Alabama Power Company, Birmingham, Ala.; how it was organized; how it fits in with the rest of the organization, how it operates, and the results achieved. In the near future similar reports regarding rural electric service departments in other companies will be issued.

It should be understood that the Rural Electric Service Committee of the National Electric Light Association in presenting these reports does not pretend to recommend the plan of organization and operation of any one company. It merely presents the methods of these companies for what they may be worth to others undertaking the organization and operation of such departments.

THE AGRICULTURE OF ALABAMA

Alabama is divided into seven agricultural divisions, based on general soil characteristics, as shown in Fig. 1. While certain of these divisions lend themselves particularly well to specialized agricultural pursuits—winter and spring vegetables in the southern part of the Lower Coastal Plain, and dairying and other livestock in the Black Belt that is well adapted to good, low-cost permanent pasture—the long growing season and the versatility of the soil adapts practically the entire State to a diversified farming program.

FIG. 1—STATE OF ALABAMA, SHOWING SOIL DIVISIONS, RANGE IN GROWING DAYS, AND AVERAGE RAINFALL.

Cotton is generally adapted to the entire State and is the chief money crop. Experimental studies and experience have developed economical methods of cotton production under boll-weevil conditions. Therefore, cotton will continue to be the major money crop, but there is a trend already under rapid development to supplement the cotton crop with more farm products, both for local consumption and for out of State markets. The production of dairy products, poultry products, beef cattle, hogs, fruits, vegetables, pecans and other crops, both on specialized farms and as supplementary to cotton and corn production, is advancing rapidly.

The State Agricultural Experiment Station, Auburn, Ala., has, through the development of specific information, laid the foundation for vast improvements in soil fertilization, crop varieties, rotation and methods of cultivation. This is resulting in increased production per acre and per man, and a reduced cost of production per unit. The experimental work is being made more comprehensive and effective through the establishment of branch experimental stations and fields in the different agricultural sections of the State.

Through the work of the Agricultural Extension Service, which directs the efforts of the County Agricultural and Home Demonstration agents, recently developed information relating to better agricultural practices is disseminated to the farmers throughout the State.

The State Department of Agriculture cooperates in the dissemination of information to the farmers, and through its inspection, standardization and other regulatory activities is having a profound influence upon the production and marketing of the State's agricultural products.

The Farm Bureau is, through its cooperative marketing and purchasing associations, rendering agriculture a great aid, not only in the handling of products, but also in establishing the cooperative idea among farmers.

Publication No. 289.61, Serial Report, Rural Electric Service Committee.

P 9

Industries of the State have become more familiar with the agricultural problems and are cooperating with the farmers very effectively, especially in the distribution of agricultural products for local consumption.

These activities, together with the increased industrialization of the State, are creating a trend toward improved farming methods and a more prosperous agriculture.

Statistical Picture of Alabama Agriculture

Based Largely on Data Collected by U. S. Bureau of Census—1925

Land area of State	32,818,560 acres
Land area in farms	16,739,139 acres
Per cent of land area in farms	51.0

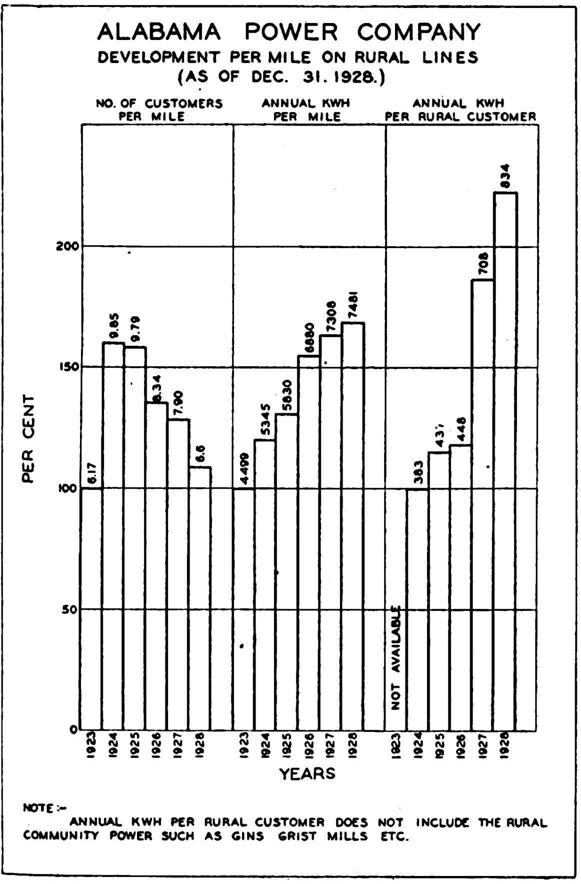
State Highways

The state highway system, which is under the supervision of the State Highway Department, comprises approximately 5600 miles of road. This is less than 10 per cent of the total road mileage of the State, and is classified as follows:

	Miles of Road
Paved	700
Gravel	1,705
Sand-clay	844
Improved dirt	768
Unimproved dirt	1,576

RURAL ELECTRIC DEVELOPMENT IN ALABAMA

The rural electric development by Alabama Power Company includes the expansion of electric service outside the corporate limits of towns and cities, serving less than twenty customers per mile of distribution line, and does not refer to purely farm service. On Jan. 1, 1929, the company was serving 5511 rural customers from 836.5 miles of lines, an average density of 6.8 customers per mile



NOTE:—
ANNUAL KWH PER RURAL CUSTOMER DOES NOT INCLUDE THE RURAL COMMUNITY POWER SUCH AS GINS GRIST MILLS ETC.

FIG. 3—Development per Mile on Rural Lines—Alabama Power Company.

	MILES OF LINE	NO. OF CUSTOMERS	ANNUAL KWH
CHANGED FROM RURAL TO URBAN (1928)	33.45	580	410,000
RURAL (AS OF DEC. 31 1928)	836.47	5511	6,154,871
TOTAL	869.92	6091	6,564,871

FIG. 4—Development of Rural Lines—Alabama Power Company.

of line. Approximately 70 per cent of the rural customers served at the date were farmers, and the company was serving 2000 farmers from distribution lines that are not classed as rural.

ORGANIZATION AND WORK OF RURAL SERVICE SECTION

The rural electrification work of the Alabama Power Company is organized as a section of the Rural and Towns Division of the Sales Department. At present the personnel of this section consists of a chief agricultural engineer, an assistant agricultural engineer and four agricultural engineers assigned to operating division offices. It is planned to expand this personnel to include one agricultural engineer for each division office, and ultimately when the number of rural customers increases sufficiently, it is expected that agricultural engineers will be assigned to district offices.

The work of the Rural Section consists primarily of developing the electrical consciousness in rural communities, which have requested electric service, to the point that there is available a sufficient load to justify the extension of new rural lines and assisting farmers and others already served in reaching the ultimate economic limit for uses of electricity. In this work there is a special effort made to recommend only such uses of electricity that will be a benefit to the customer. This necessitates that the men in this work be thoroughly familiar with practices, new developments and trends in agriculture in their territories, and speak a language which the farmer can understand. They must keep accurately informed as to applications of electricity and equipment best suited to the existing conditions and be able to assist the farmers in making changes in their methods of operation that will prove more profitable and make electricity more valuable to them.

Following are the main activities of the Rural Section:

(a) In answer to requests for electric service, community meetings and personal contact work is conducted to familiarize the prospective customers with the different uses of electricity applicable to the conditions, and with the company's rural rate.

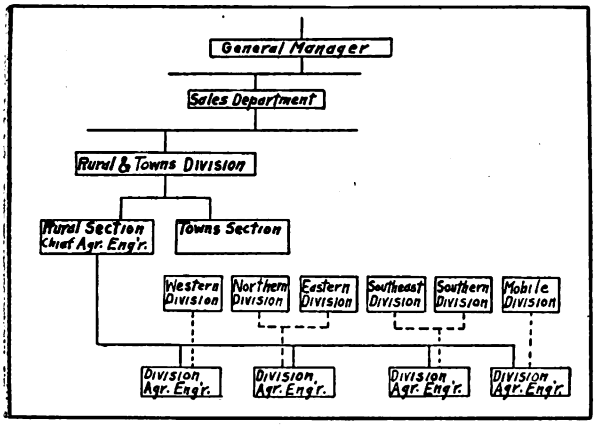


FIG. 5—ORGANIZATION OF ALABAMA POWER COMPANY FOR RURAL ELECTRIC DEVELOPMENT.

(b) If the results of this preliminary work indicate that electric service is feasible to the community requesting service, a complete commercial survey is made including map of proposed line with prospective customers and loads indicated.

(c) If the preliminary work indicates that the proposed line is not feasible at that time, the educational efforts are continued periodically at the request of the people until sufficient load is developed. In many instances this activity continues as long as two years or more before the project is developed to the point of signing customers.

(d) Where the farm operations are of considerable volume the rural service men make a detailed analysis and prepare a written report including time, labor and costs with and without electric service for each operation to assist the farmer in his problems. This is done for both prospective and existing customers.

(e) After the preliminary work is completed and surveys indicate that the extension will be feasible both to the company and the proposed customers, an effort is made to sign the customers for service, at which time the explanations are continued at considerable length with each prospective customer. Rural customers are signed by both the rural service men and by a crew of men in the Towns Section, who devote their entire efforts to making surveys and signing customers in new towns and on rural lines.

(f) As rural customers are signed, each customer indicates what equipment he intends to use. Then, when the customer signing is completed, a list of signed customers and equipment to be used by each is made and copies mailed to the Merchandise Sales Supervisor of the local territory in which the line is to be built. Salesmen, either alone or with the rural service man, follow through and make the sales of equipment that is handled by the company, and local dealers are advised of live prospects for equipment not sold by the company. Representatives of the Rural Section do not actually sell equipment, but cooperate with both the company's salesmen and local dealers in completing sales.

(g) After rural lines have been in operation for a year or more, the rural service men conduct periodical community meetings at which electrical equipment for the home and farm is discussed and demonstrated. These meetings are held in cooperation with the State Agricultural Extension Service and equipment manufacturers, and are usually confined to a limited list of equipment at any one meeting.

(h) The Rural Service Section is continuously analyzing reports pertaining to uses of electricity on the farm, and information that is considered applicable to local conditions is summarized and distributed through the rural service section.

(i) The rural service men make periodical calls on the customers to discuss with them their problems and to call to their attention new ideas pertaining to the use of electricity.

(j) The Rural Service Section aggressively presents to manufacturing companies equipment needs that are not at present met, and cooperates with the

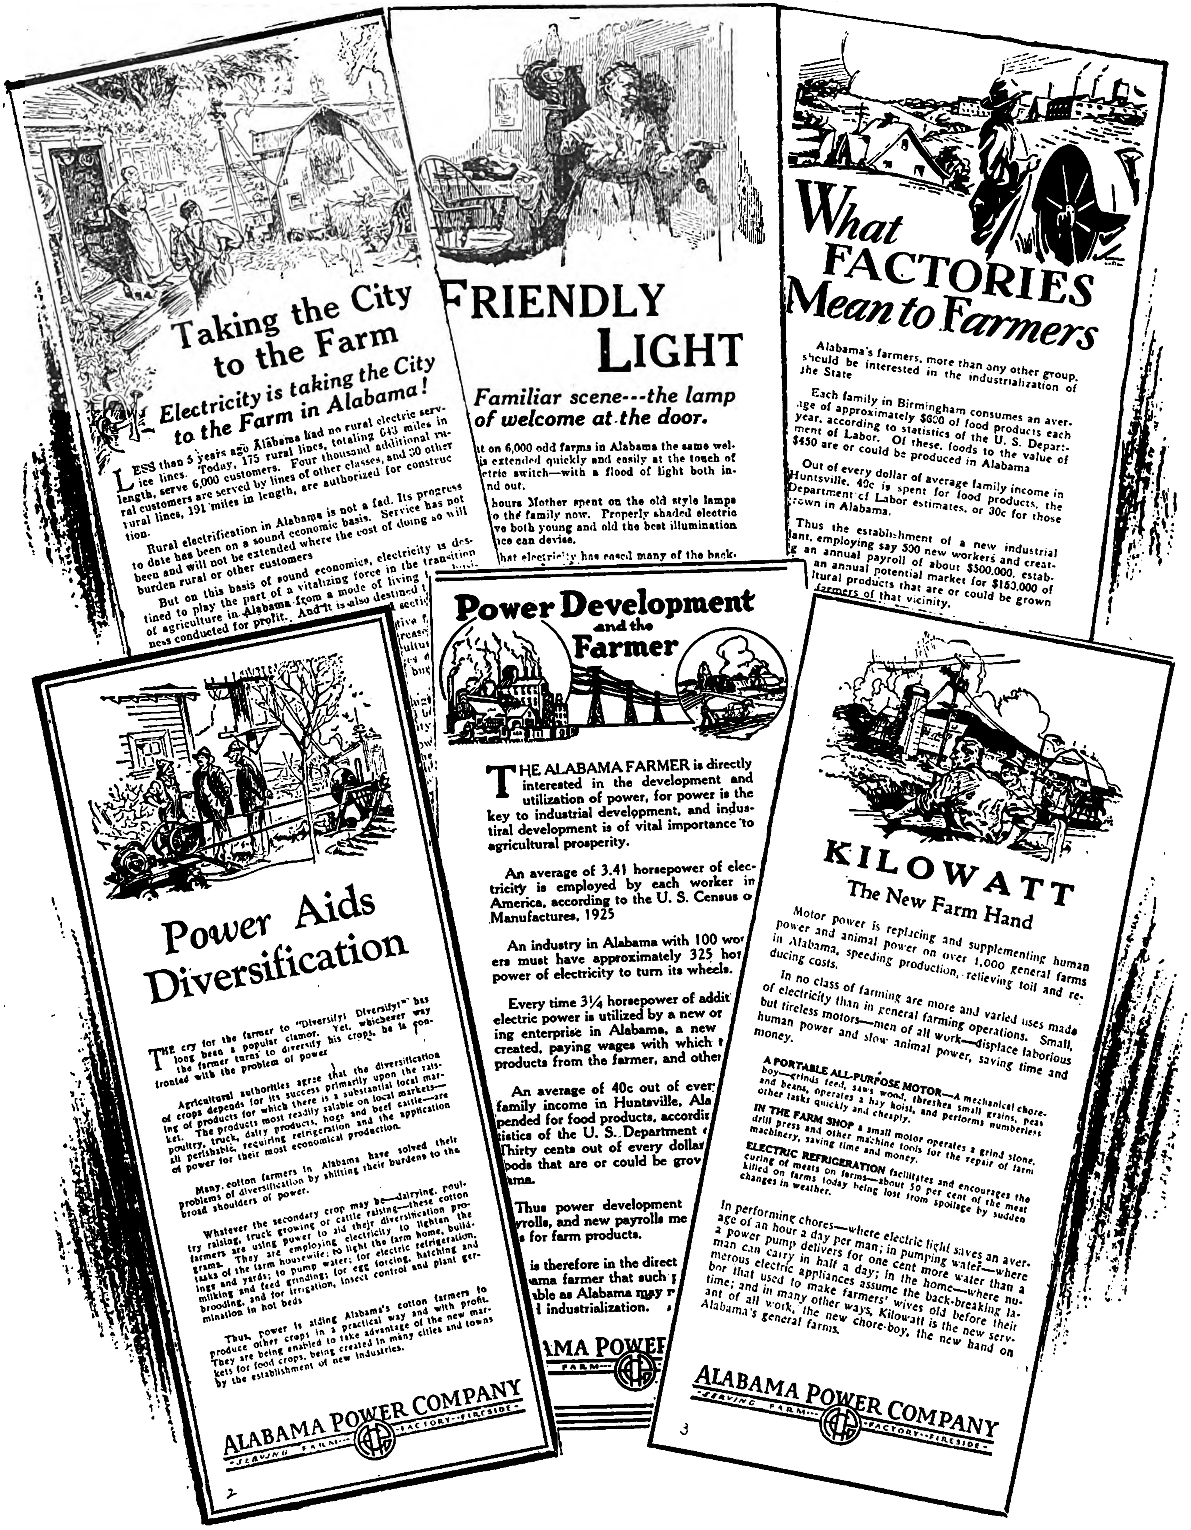
FIG. 6—OUTLINE OF THE METHODS OF PROCEDURE WITHIN ALABAMA POWER COMPANY INCIDENT TO THE ESTABLISHING OF ELECTRIC SERVICE IN A RURAL COMMUNITY.



Taking the City to the Farm

Electricity is taking the City to the Farm in Alabama!

LESS than 5 years ago Alabama had no rural electric service lines. Today, 175 rural lines, totaling 643 miles in length, serve 6,000 customers. Four thousand additional rural customers are served by lines of other classes, and 30 other rural lines, 191 miles in length, are authorized for construction.

Rural electrification in Alabama is not a fad. Its progress to date has been on a sound economic basis. Service has not been and will not be extended where the cost of doing so will burden rural or other customers

But on this basis of sound economics, electricity is destined to play the part of a vitalizing force in the transition
of agriculture in Alabama from a mode of living t
ness conducted for profit. And it is also destined t

What FACTORIES Mean to Farmers

Alabama's farmers, more than any other group, should be interested in the industrialization of the State

Each family in Birmingham consumes an average of approximately $600 of food products each year, according to statistics of the U. S. Department of Labor. Of these, foods to the value of $450 are or could be produced in Alabama

Out of every dollar of average family income in Huntsville, 40c is spent for food products, the Department of Labor estimates, or 30c for those grown in Alabama.

Thus the establishment of a new industrial
lant, employing say 500 new workers and creat-
g an annual payroll of about $500,000, estab-
an annual potential market for $150,000 of
ltural products that are or could be grown
farmers of that vicinity.

Power Aids Diversification

THE cry for the farmer to "Diversify! Diversify!" has long been a popular clamor. Yet, whichever way the farmer turns to diversify his crops, he is confronted with the problem of power

Agricultural authorities agree that the diversification of crops depends for its success primarily upon the raising of products for which there is a substantial local market. The products most readily salable on local markets—poultry, truck, dairy products, hogs and beef cattle—are all perishable, requiring refrigeration and the application of power for their most economical production.

Many cotton farmers in Alabama have solved their problems of diversification by shifting their burdens to the broad shoulders of power.

Whatever the secondary crop may be—dairying, poultry raising, truck growing or cattle raising—these cotton farmers are using power to aid their diversification programs. They are employing electricity to lighten the tasks of the farm housewife; to light the farm home, buildings and yards; to pump water; for electric refrigeration, milking and feed grinding; for egg forcing, hatching and brooding, and for irrigation, insect control and plant germination in hot beds

Thus, power is aiding Alabama's cotton farmers to produce other crops in a practical way and with profit. They are being enabled to take advantage of the new markets for food crops, being created in many cities and towns by the establishment of new industries.

2

Power Development and the Farmer

THE ALABAMA FARMER is directly interested in the development and utilization of power, for power is the key to industrial development, and industiral development is of vital importance to agricultural prosperity.

An average of 3.41 horsepower of electricity is employed by each worker in
America, according to the U. S. Census o
Manufactures, 1925

An industry in Alabama with 100 wo
ers must have approximately 325 ho
power of electricity to turn its wheels.

Every time 3¼ horsepower of addit
electric power is utilized by a new or
ing enterprise in Alabama, a new
created, paying wages with which t

AMA POWE
FARM--

KILOWATT

The New Farm Hand

Motor power is replacing and supplementing human power and animal power on over 1,000 general farms in Alabama, speeding production, relieving toil and reducing costs.

In no class of farming are more and varied uses made of electricity than in general farming operations. Small, but tireless motors—men of all work—displace laborious human power and slow animal power, saving time and money.

A PORTABLE ALL-PURPOSE MOTOR—A mechanical chore-boy—grinds feed, saws wood, threshes small grains, peas and beans, operates a hay hoist, and performs numberless other tasks quickly and cheaply.

IN THE FARM SHOP a small motor operates a grind stone, drill press and other machine tools for the repair of farm machinery, saving time and money.

ELECTRIC REFRIGERATION facilitates and encourages the curing of meats on farms—about 50 per cent of the meat killed on farms today being lost from spoilage by sudden changes in weather.

In performing chores—where electric light saves an average of an hour a day per man; in pumping water—where a power pump delivers for one cent more water than a man can carry in half a day; in the home—where numerous electric appliances assume the back-breaking labor that used to make farmers' wives old before their time; and in many other ways, Kilowatt is the new servant of all work, the new chore-boy, the new hand on Alabama's general farms.

2½ cents per KWH for all over 1,000 KWH consumed per month.

DISCOUNT

The current monthly bill is subject to a discount of ½ cent per KWH of energy consumed, provided the amount is paid in full at the office of the Company within ten days from date of bill.

RURAL LINE CHARGE

In addition to the rate for electric energy actually consumed each Consumer receiving service from a rural line shall pay monthly a Rural Line Charge based upon the number of Consumers per mile and the individual capacity contracted for, as follows:

	Consumers per Mile			
Monthly Rural Line Charge:	Over 15 Group "A"	Over 10 & not more than 15 Group "B"	Over 5 & not more than 10 Group "C"	5 or less Group "D"
For the 1st KW of contracted capacity or fraction thereof....	$1.75	$2.25	$3.00	$4.00
For each additional KW of contracted capacity	1.50	1.50	1.50	1.50

DETERMINATION OF CONSUMERS PER MILE & CONSUMERS' CONTRACTED CAPACITY

The Consumers per Mile shall be the total number of consumers served from the rural line, not including those in urban centers served from such line, divided by the total mileage of distribution pole line serving such Consumers, exclusive of service lines.

The Contracted Capacity of each Consumer shall be the sum total of his load requirements determined as hereinafter set out but not less than an amount sufficient to bring the total contracted capacity of all Consumers served by a rural line under this Classification to a minimum of 10 KW per mile of rural line. When urban or industrial load is served from a rural line the Company will credit the rural line with such

(Continued)

Effective for service rendered from rural lines authorized and constructed subsequent to July 1, 1927; for service rendered to any rural consumer requesting this classification on existing experimental rural lines; and for all rural service after June 30, 1930.

business and will modify the minimum rural requirements according to Rule 9 under Special Rules Governing the Application of Service Classification "E".

Lighting Load:

Ordinary farm and household lighting load (including lamp socket appliances not permanently connected) will not be counted in determining contracted capacity, except where no other load is connected and in such case of lighting load only the contracted capacity shall not be less than 1 KW.

Motor Load:

a. GENERAL POWER—
The kilowatts of motor load other than seasonal power shall be as follows:
70% of the horsepower rating of the largest capacity motor; plus
50% of the horsepower rating of all other motors.

b. SEASONAL POWER—
The largest capacity motor used exclusively for farm power service, if of 10 horsepower rating or over, shall be considered a seasonal load and the kilowatts of motor load shall be taken as 25 per cent of its horsepower rating, provided the transformer capacity required for its operation is furnished by the Consumer.

Range Load:
25% of the connected domestic range load, but not less than 2 kilowatts.

Heating and All Other Load:
100% of the Manufacturer's rating of such equipment, or by test.

Where double throw switches are used, the maximum sum total of the Consumer's loads, as determined above, which can be operated at one time, will determine the contracted capacity.

OPTIONAL DEPOSIT IN LIEU OF RURAL LINE CHARGE

Any Consumer receiving service from a rural line may, at his option and in lieu of the monthly Rural Line Charge, deposit with the Company an amount equal to $150 for each $1 of monthly Rural Line Charge as determined above. Such deposit will be returned to the Consumer in full without interest at the time of the termination of his contract and in no instance less than one year from the beginning of service.

(Continued)

Effective for service rendered from rural lines authorized and constructed subsequent to July 1, 1927; for service rendered to any rural consumer requesting this classification on existing experimental rural lines; and for all rural service after June 30, 1930.

SPECIAL RULES GOVERNING THE APPLICATION OF SERVICE CLASSIFICATION "E"

1. A Rural Line is defined to be:

A. Any electrical distribution line of 11,000 volts or less, not within the corporate limits of a municipality, which serves less than twenty Consumers per mile of pole line, and/or

B. Any electrical distribution line of 11,000 volts or less, within the corporate limits of a municipality, which serves less than twenty Consumers per mile of pole line, upon approval of the Alabama Public Service Commission.

2. Each rural line as originally constructed shall be considered a unit in applying the rural line charge, unless there is such a wide difference in Consumer-density between sections or branches of such line as to constitute marked discrimination against the higher density group, and in this event such sections or branches may be considered separate rural lines.

3. New Consumers added to a rural line will be served under the same rural line charge as existing Consumers on such line, unless such addition constitutes an extension which would reduce the average number of Consumers per mile of line, in which event the extension shall be considered a new rural line.

4. Any section of a rural line immediately adjacent to the source of supply of such line reaching a density of 20 Consumers per mile shall become an urban line and service shall be rendered to such section at such urban rates as may be applicable, provided the remainder of such rural line can be served without increase in rural line charge to the Consumers served therefrom.

5. The Rural Line Charge or equivalent optional Rural Line Deposit of each Consumer shall be subject to adjustment on January 1st of each year.

6. The Company will furnish and install, free of expense to the Consumer, service wires from its pole line to the first approved point of permanent support, or to the first pole of service on Consumer's premises. Special service lines required to be constructed on private property shall be constructed by the Company at cost and will be subject to a special agreement between the Company and the Consumer, or Consumers, to be served.

7. Where three phase service is available for farm power service, such service at the option of the Consumer may be established for motor loads of 5 h. p. and over and billed as to a separate Consumer under this rate.

8. Any industrial Consumer served from a rural line shall be billed at the rate on file with the Public Service Commission applicable to such service.

9. The credit to a rural line for urban or industrial business shall be figured as follows:

(Continued)

Effective for service rendered from rural lines authorized and constructed subsequent to July 1, 1927; for service rendered to any rural consumer requesting this classification on existing experimental rural lines; and for all rural service after June 30, 1930.

FIG. 10—Service Classification "E," Rural Electric Service Page 3, Alabama Power Company.

SERVICE CLASSIFICATION "E"

RURAL ELECTRIC SERVICE

110-220 VOLTS

(Continued)

a. *Equivalent Rural Consumers:* To be found by taking four times the estimated first year's revenue to be received from the urban or industrial load less the initial cost to connect such additional load and dividing the remainder by 200.

b. *Contracted Capacity*: Each equivalent Rural Consumer as determined above shall be considered as having one (1) kilowatt of contracted capacity.

NOTE: Rule 9 is based on the Company being willing to spend four times the initial annual revenue to obtain urban or industrial business served from a rural line and upon an average revenue per rural Consumer of $50.00 per year. Reduced to a formula Rule 9-a becomes:

Equivalent Rural Consumers equals

$$\frac{\text{Estimated First Year's Revenue}}{\$50} \text{ less } \frac{\text{Estimated Initial Cost to Connect}}{\text{4 times } \$50}\text{, or}$$

$$\frac{\text{(4 times Estimated First Year's Revenue) minus (Initial Cost to Connect).}}{200}$$

MINIMUM

In consideration of the readiness of the Company to furnish such service, a monthly minimum charge equal to the Rural Line Charge will be made.

TERM OF CONTRACT

Service under this Classification shall be for a period of not less than:

(1) Five years on rural lines having an average of not over five (5) Consumers per mile of line,

(2) Three years on rural lines having an average of not less than five (5) and not over ten (10) Consumers per mile of line,

(3) One year on rural lines having an average of more than ten (10) Consumers per mile of line,

and thereafter from year to year, unless terminated by thirty (30) days written notice.

Service under this Classification is subject to
Rules and Regulations approved or prescribed
by the Alabama Public Service Commission.

Effective for service rendered from rural lines authorized and constructed subsequent to July 1, 1927; for service rendered to any rural consumer requesting this classification on existing experimental rural lines; and for all rural service after June 30, 1930.

CUSTOMER DEPOSIT CARD

(To be returned to applicant upon receipt of deposit)

Alabama Power Company,

Birmingham, Alabama.

Gentlemen:

I have today made written application to you for electric service at my residence at____________________, Alabama, on your Form 1173 Service Classification_______________. I understand that your rules and regulations require the deposit of $_______________to insure prompt payment of bills for such service. I beg to advise that I will make such deposit on demand after construction work has begun on the distribution system in____________________and before the service is connected to my premises.

Yours very truly,

____

FIG. 13—CUSTOMER DEPOSIT CARD, ALABAMA POWER COMPANY.

manufacturers in the development of equipment needed for local conditions.

(k) When a farmer requests information for special installations, the Rural Service Section furnishes all available information and refers the prospect to such manufacturing companies that have shown ability and willingness to insure proper installations.

(l) Through the Manager of the Rural and Towns Division, the Engineering and Operating Departments are informed as to the nature of rural load affecting the construction and operation of rural lines. A consistent effort is made to prevent the lagging of rural line construction too far behind the signing of customers.

(m) In cooperation with the company's Publicity Department, the Rural Service Section prepared a thirty-two page booklet entitled "Electricity Serves the Farm." Ten thousand copies of this booklet were published and distributed, mainly to farmers of the State.

(n) The Rural Service Section cooperates with the Publicity Department in the preparation of advertising and news items for newspapers and magazines. The company's slogan is "Serving Farm, Factory and Fireside."

(o) Copies of "Electricity on the Farm" are distributed regularly to a selected list of 300 farm customers.

(p) The Rural Service Section cooperates with other agricultural agencies of the State in problems pertaining to the use of electricity in agriculture. An annual report of the Progress of Rural Electrification is made to the Director of Agricultural Extension Service. Information as to the development of rural electric service is furnished the Agricultural Editor of the Extension Service.

(q) Close cooperation is maintained with the National Committee on the Relation of Electricity to Agriculture and the Rural Electric Service Committee of the National Electric Light Association, in the effort to make available more general and specific information as to rural electrification.

(r) The Rural Service Section keeps records of individual customers, rural lines and different equipment, necessary to keep an accurate check of the development's progress. A monthly report is made to the management, including the number of customers, number of lines and miles of lines added during the month, the total on the first of each month, the projects authorized and under construction and those under consideration.

A detailed annual report is made to the management, including customers, miles of lines and annual kilowatt-hour sales, with the progress made during the year in the different parts of the activity, as load building and increased energy consumption per rural customer, and per mile of rural line.

Selling Equipment to Rural Customers

Equipment handled by the company is sold to rural customers by representatives of the Merchandise Division. In case a rural customer desires equipment not sold by the company, arrangements are made to have his needs taken care of either by a local dealer or by the manufacturing company.

The company handles the usual line of electrical equipment, including ranges, water heaters, household refrigerators, washing machines and small appliances for the home. In addition, the company sells a line of water pumps especially for small town and rural customers.

Other equipment demanded by farmers, including dairy refrigerators, feed grinders, overhead irrigation systems, milking machines, incubators, brooders and motors, is sold by local dealers or factory representatives. The general sales plan is through the "live prospect" approach. These prospects are turned in by the rural service men. Prospects are found by the rural service men at the time of signing customers, or by the customers writing to the Rural Service Section for information pertaining to the use of some piece of equipment.

For equipment sold by the company the same term payments are offered to rural customers as to other classes of customers. These terms vary with different pieces of equipment.

The most important items sold to rural customers from a satisfactory load building standpoint are ranges, dairy refrigerators, household refrigerators and water systems. It is probable that farm refrigeration in its different ramifications will become the base load for rural electrification in this State. Sales efforts are turning in this direction.

Meter Reading and Billing Rural Customers

Meter reading and billing rural customers is handled just as the other classes of customers served by the company. Meters are read each month by the regular meter readers, and bills are rendered monthly by the Accounting Department.

Developing Appreciation of Rural Electric Service

Within the Company

Realizing that the success of rural electric development is dependent upon making it a part of the company's general program, rather than purely the activity of a separate division, those directly connected with this work have continuously attempted to sell the other departments of the company as to the progress and results obtained. This effort is through direct contact with employees of the different departments and through the preparation of monthly and annual progress reports. However, with the method of procedure followed by this company practically every department has an active part in the development just as with other classes of service. The surveys for new proposed lines are made by the Towns Division, the engineering is handled by the Engineering Department, the lines are built by the construction company, household equipment is sold to rural customers by the Merchandise Division, the lines are operated and service maintained by the Operating and Service Departments, and the rural customer billing and collecting is taken care of by the Accounting Department. Therefore, each department is somewhat familiar with the progress of the development.

Among Rural People

Interest in rural electric service was created in Alabama through exhibits at state and county fairs for two seasons, illustrating some of the uses and advantages of electricity, and through the progress of the experimental work conducted by the company and the Agricultural Experiment Station for a period of three years. This interest in and the appreciation of the value of electric service is maintained and developed among rural customers through education work conducted through direct contact with proposed and existing customers, and through cooperation with other agricultural agencies of the State. For example: In 1927 the company, in cooperation with the Dairy Department of the Agricultural Extension Service and the International Harvester Company, held a series of meetings throughout the State at which dairy equipment was discussed and demonstrated. In 1928 a series of meetings were held throughout the State in cooperation with the Home Demonstration Agents, and the Edison Electric Appliance Co. At these meetings the uses of electrical household appliances for the farm home were discussed and demonstrated. The agricultural engineers of the company devote the major part of their time in an effort to educate proposed and existing rural customers as to profitable applications of electricity. In 1928, as a part of its load-building program, the company published a farm booklet, discussing and illustrating some of the uses of electricity on Alabama farms. These booklets have been distributed among the existing and proposed rural customers.

Results and Effects

Number of rural lines Jan. 1, 1924	14
Number of rural lines Jan. 1, 1929	256
Miles of rural lines, Jan. 1, 1924	39
Miles of rural lines, Jan. 1, 1929	836.5
Number of rural customers Jan. 1, 1924	240
Number of rural customers Jan. 1, 1929	5,511

ANNUAL KW-HR. CONSUMPTION PER RURAL CUSTOMER

Lines Built	Dec. 31, 1927	Dec. 31, 1928
1928	...	670
1927	...	728
1926	445	512
1925	629	671
1924 (or earlier)	900	1260
Total	708	834

The 256 lines are not only serving the present rural customers, but are also sources of electric service for additional extensions in the future development.

The company has an organization for conducting rural electric service work, actively engaged in an effort to build additional rural lines and to increase the load on existing rural lines.

The company had designed a rate for rural electric service, which has established rural electrification as a definite part of the company's development on a business basis.

The farmer's interest in the uses of electric service has been created and developed very rapidly.

The farmers of the State understand that the power company is perfectly willing and anxious to attempt in every way economically possible to extend service to them. They also appreciate the fact that if rural electric service is to be successful it must be satisfactory to the customers and the company.

The company realizes that it is possible to develop a satisfactory rural load.

The average energy consumption by rural customers has increased from 383 kw-hr. in 1924 to 834 kw-hr. in 1928.

Rural electric service is:

1. Resulting in more comfortable and attractive living conditions on the farm.
2. Creating new interest in farming as a life occupation.
3. Reducing farm operating costs and making practical a better balanced farming program.
4. Making available a source of convenient power for the operation of rural community enterprises.
5. Establishing a better mutual understanding between the farmers and the company.

RURAL LINES AND SYSTEMS

I. Types of Systems

(a) 2300 and 4000-volt systems.
(b) 6900-volt systems.
(c) 11,500-volt systems.

The 2300 and 4000-volt systems are merely short extensions of existing urban distribution systems which are extended into rural territory. The 6900-volt, 3 ø lines were first constructed when it developed that the 2300 and 4000-volt lines did not have capacity to supply the loads as found in the rural territory in Alabama. The majority of these lines have been reconnected as four-wire systems for 11,000-volt operation. Practically all of the rural lines now being constructed by the company are 11,000-volt systems.

These lines are supplied either from step-up banks located at the end of an urban feeder or from separate rural distribution substations. These are usually 44,000 to 6900-volt Y substations, equipped with automatic reclosing circuit breaker and ground relay protection which opens the circuit in case the conductor falls to the ground.

II. Line Construction

Lines are constructed according to the following general specifications:

(a) Right of way:

Lines are constructed along the margin of the public road, permission being obtained from state or county authorities. Tree trimming and anchor rights are obtained from individual property owners.

(b) Poles:

35 ft. 6 in. top creosoted pine.

(c) Cross arms:

Standard N. E. L. A. 6-pin arms with standard braces and hardware.

(d) Conductors:

Conductors are either hard-drawn copper or aluminum cable steel reinforced.

(e) Pins:

Standard wood pins are used on straight line construction. A clamp-on steel pin for small angles and dead end with strain insulators on angles 30 deg. and over.

(f) Insulators:

Insulators are standard 17 kv. porcelain pin type.

NOTE: Even though lines are built to operate at 2300 or 6900 volts, they usually are insulated for 11,000-volt operation, in view of changing over to this voltage as load conditions may require.

(g) Pole Spacing:

Pole spacing is approximately 275 ft. with copper conductors, and 325 to 350 ft. with aluminum. Highway conditions often make it impossible to obtain a 325-ft. span, in which case the company has found it more economical to use copper conductors.

(h) Anchoring:

Angles of 7 deg. and less usually are held by raking the pole without anchoring. Angles of over 7 deg. are supported with one or two patented anchors as required.

Pole setting and wire stringing is done in accordance with the National Electric Safety Code.

III. Secondary Service

Secondary service usually is furnished at 110-220 1 ø or 220 3 ø. Transformers are standard distribution transformers protected with open type of fuses and standard lightning arresters.

On the majority of systems of the Alabama Power Company it is found economical to string secondary systems and connect several customers from the same transformer bank.

BUILDING THE LOAD ON THE FARM

FOREWORD

There has been serious question in the minds of many people as to whether an acceptable load for electric light and power companies can be developed on the 6,371,640 farms in the United States. This serial report is being published by the Rural Electric Service Committee as some evidence, at least, that such a load exists and that it can be developed by intelligent effort.

This term "acceptable load" calls for some explanation. To one unfamiliar with the problem of extending electric light and power company service to the farm, this talk of building a bigger and bigger consumption on the farm might be suggestive of greed on the part of the companies. No such conclusion is warranted by the facts. Those familiar with the problem know that if scattered farm customers are to be small and conservative users of electric energy it is well nigh impossible to extend that service to them at a price acceptable to the company and at the same time not prohibitive to the farmers.

An Acceptable Load

It follows, therefore, that the only way to reach the American farm with power company service is to make the farmer a relatively large consumer. This is vital, but the industry must not lose sight of the fact that in increasing the farm customer consumption it must show the farmer how to use this additional amount of electric current to his own advantage.

This naturally brings up the question of what constitutes a small and conservative user and what constitutes an acceptable load. Of course, the figures offered in answer to both these questions vary according to conditions. As rural service is largely a problem of distribution costs, it must be obvious that where there are ten to fifteen farm customers to a mile of line there is less necessity for load building than in rural districts where there are from one to three customers to the mile.

Those Scattered Farms

Under average conditions throughout the United States there are fewer than three potential farm customers to a mile and it is on this average condition that the answer to these two questions will be made. Farmers using 300 kw-hr. a year under these conditions clearly and certainly fall into the class of small and conservative users, which is to say that if the company is to earn a fair return on such service it must maintain a rate well-nigh prohibitive to the farmer; at least a rate which necessitates the farmer counting electric service as something of a luxury.

It is more difficult to answer the second question as to how much current a farmer must use under these average conditions to make electric service really feasible to him and at the same time acceptable to the company. There is no definite figure which can be offered as an answer, but those who speak with more or less authority are generally agreed that when the farmer uses 1200 kw-hr. a year, it is perfectly feasible for the company to establish a rate acceptable to both the company and the farmer.

This figure of 1200 kw-hr. a year, when compared with conditions existing a few years ago when the electric industry first went into partnership with other agencies in seeking a solution of this problem, sounds rather high. It represents about four times the old average per farmer per year. This comparatively small average consumption of several years ago pertained generally throughout the nation, excepting in arid agricultural districts where electricity was in demand for water pumping. Outside of the areas where electricity was in demand for pumping of water for irrigation purposes, 300 kw-hr. a year represented average farm consumption.

Multiplying Consumption

Naturally an existing average consumption of 300 kw-hr. a year some five or six years ago and the necessity for quadrupling this consumption to make the farm service feasible, gave rise to doubts in the minds of many as to whether it ever could be done. Much, however, can be learned in five years, and at the meeting of the Rural Electric Service Committee of the National Electric Light Association held in Chicago in September, 1928, it was determined to obtain some idea of what kind of a load actually has been built on farms since we began developing real facts. In going about this job it was determined to gather data from every part of the United States so that no one could say: "Oh, probably a load can be built with the type of agriculture they have in other parts of the country, but in our state it is different."

A communication was sent by the Rural Electric Service Committee to every state in the union asking for from three to five examples of actual farmers using in excess, not of 1200 kw-hr. a year but of 3000 kw-hr. a year. It was specified that the National Committee did not wish the names of city men operating farms as playthings, but of real farmers wresting a living from the soil. In a few instances this admonition was not heeded, but in the vast majority of cases it was strictly adhered to.

Returns have been received and will be found in this report from almost every state in the union. Some states sent only the minimum of three examples asked for, some sent five and some sent many times the number requested, and many offered to send numerous others on request.

Ten Times Old Average

Listed in this report, as visual evidence that an acceptable load can be built on the farm, are the

---

Publication No. 289-65. Serial Report, Rural Electric Service Committee.

names of these farmers, their addresses and current consumption, and a brief summary of the purposes for which the electricity is employed. It will be noted in going over this list that the modern farmer does not stop at 3000 kw-hr. a year, but that he uses 4000, 5000, 10,000 and 20,000 kw-hr. a year and does not stop even there.

When it is taken into consideration that this building of a load on the farm still is in its infancy there is much cause for gratification in the fact that at this early period almost every one of our forty-eight states offers examples of farms using in excess of ten times the old average. It is probable that the few states missing from the list have similar examples, though the companies in those states failed to answer the questionnaire.

Some of those who study this list may suggest that dairy and poultry farming predominate. This is true, and quite naturally so. When the study of applying electricity to agriculture first was taken up seriously, the investigators started in on the jobs nearest at hand—on the use which appeared most obvious. It was found on dairy farms that there were so many things that were just "crying out loud" for electricity that the investigators took them on first. To a large extent this also was true of poultry farming. Hence the predominance in this list of dairy and poultry farms.

A close study will reveal, however, that many of the services rendered by electricity on dairy and poultry farms can be equally well employed on any farm and it will be further revealed that uses for electricity are being developed on other types of farms.

Every Type of Farm Has Possibilities

Electricity operated water systems and refrigerators occur frequently in the description of the various uses to which electricity is being put on dairy and poultry farms. Both these improvements are equally essential on every farm. It will be found that in the Pacific Northwest electricity is playing its part in operating prune driers, operating hop ranches and driving spray pumps on fruit ranches. There is one mention of an electrical honey extractor and there are several mentions of electric motors employed in farm shops to drive lathes, drills and other tools. It has been contended in the South that cotton farming did not lend itself readily to the application of electricity, but at a rural conference held last November in Dallas, Texas, an interesting paper was read on the employment of electrically operated pumps to irrigate cotton lands. The figures showed that the experiment in cotton irrigation was very much of a success.

For household purposes electricity is just as important on the cotton plantation, or on one of the big wheat farms in the central West or Northwest, as it is on any other kind of a farm, and as the investigators proceed they likely will find in this virgin field plenty of advantageous uses for electric energy in all types of farming.

In the more distant future there is the idea of employing electric power in field work. Little is known about this as yet, but a number of individuals are working on this problem and if a successful solution can be found it will open up a bigger field for electric power in agriculture than anything that has so far been explored.

The National Experimental Project located in the State of Maryland will be utilized for a considerable exploration along this line.

How Load Has Been Built

Those most intimately in touch with this work feel that so far only the surface has been scratched and that beyond lies a most inviting field bidding the ingenuity of man to try to conquer it.

Leaving this for the time being for the investigators to explore, there are two questions which naturally are prompted by a study of the list of farm customers contained in this report. The first is—how the load was built on these farms, and the second is—whether these farmers using this considerable amount of service really find it to their advantage.

The history of the building of this load covers a comparatively brief period. It started really with the experimental rural electric lines. The first thing these lines developed was that nobody knew very much about putting electricity to work on the farm: that it was a new field; that everything was different from things in the cities, and that it represented a virgin class of service all by itself. The investigators put electricity to work at every conceivable task which came to their attention. They devised and invented and changed things around, tried it out a new way, and finally began developing definite facts which could be utilized on other farms. As these facts began to materialize, there came into existence rural electric service departments, which have been inaugurated by most of the progressive light and power companies in the United States.

Not all of these departments are separate and independent from any other part of the organization. In fact, in many cases, they are part of the sales department or some other department, but the main idea is that in each instance the individual in charge is made responsible for keeping up to date on the application of electricity to agriculture and maintains himself and his department in a position to show any farmer in the territory served by his company how electricity best can be employed on his farm.

Those Rural Service Departments

Before these experiments were inaugurated and before the rural electric service departments were formed, very few power companies had anything practical to say to a farmer inquiring about service. For the most part the companies had no rate especially devised for farm service and had no one who was in a position to advise the farmer as to the use of electricity on his farm. Usually the only course left open to the company was to get rid of the farmer as diplomatically as possible.

Today all that is changed. The farm applicant is referred to the rural electric service department and there he meets a man who not only knows electricity but knows how to put it to work on the farm. This National Committee is engaged now in issuing serial reports descriptive of the organization and operation of rural electric service departments in companies which have met with outstanding success in this field. The first of these reports[1] dealt with the Wisconsin Power & Light Co. of Madison, Wis. Others will follow.

It is these rural specialists who have, for the most part, built this farm load which bids fair to be only a forerunner of what is to come. They have taken the facts as developed by the experimental lines and put them to work on thousands of other farms. They are in a pioneer field and are doing great work both for the industry and for agriculture.

Can Electricity Pay Its Way?

The second question pertains to whether the farmer finds liberal use of electric energy to his own advantage. There is already much general evidence, and as time goes on more and more specific evidence regarding this point. It is common knowledge among the electric light and power men engaged in rural electrification that the best satisfied farm customers are the ones who are making the greatest use of electric energy and that as a rule those who do complain are the ones who are making very limited use of it.

There is a good reason for this. It has been cited before that a 300-kw-hr.-a-year customer, if he is paying a rate sufficient to protect the company's investment, must count his service as something of a luxury. On the other hand, if the farmer is to be a liberal consumer, the company is in a position to extend to him a much lower unit rate. It therefore is obvious that the small consumer may be paying a relatively high price for a limited amount of service and that for two or three times the cost, he may obtain ten to fifteen times the amount of current. It is quite natural, then, that the small consumer is likely to be the one to complain, while the large consumer is more inclined to the true opinion that he is getting a very liberal service for a comparatively small cost.

It is equally obvious that the liberal consumer is not content merely because his liberal consumption earns him a low unit cost. In addition thereto he knows that electricity is performing numerous tasks for him at a lower cost than is obtainable by any other means of operation.

The number of liberal farm consumers is steadily on the increase and the number of small consumers steadily on the decrease, which is further general evidence that farmers are finding liberal use of electric energy a profitable investment.

Definite Figures from Red Wing

There is also specific evidence that electricity intelligently employed may be a profitable investment. The report of E. A. Stewart, former professor at the University of Minnesota and project director on the Red Wing, Minn., experimental line, shows that on five farms from which continuous records over a period of more than four years are obtainable, the gross earnings the fourth year exceeded the first year by 42.9 per cent, that the operating expenses increased only 1 per cent and that the net earnings increased 81 per cent.

In this case, the operating expenses include the bills paid the power company for current consumed, but not the overhead on the investment in equipment operated by electricity. This equipment for the five farms, if bought at retail prices, would have totaled $16,667. Figuring the interest and depreciation at 12½ per cent, this would have called for a charge the fourth year of $2,083, but even when that is added to the operating expenses and subtracted from the net earnings, there is still left an increase of 50.9 per cent in the net.

This certainly is specific evidence that electricity has proved a profitable investment on these farms. More and more of this specific evidence is becoming available. At each of the rural service conferences being held in the Geographic Divisions in cooperation with the Rural Electric Service Committee of the National Electric Light Association, farmers have stood up and told plainly and emphatically how and why electricity is more than earning its way on their farms. It is not probable that these farmers are fooling themselves. Those who have offered this testimony are farmers who keep books, who know what things cost and who offer detailed figures in support of their assertions.

The whole evidence to date, both general and specific, is strongly indicative that electricity both intelligently and liberally employed is a good investment for the farmer. Hence, as an indication that there is an acceptable load for electric light and power companies on the farm, and that that load can and is being developed, the Rural Electric Service Committee of the National Electric Light Association offers for the consideration of all interested persons the following list of farmers, scattered all over the United States, who are today using in excess of 3000 kw-hr. a year—ten times the average on farms served a few years ago:

NAMES AND ADDRESSES OF FARMERS USING 3,000 KW-HR. OR MORE PER YEAR

Alabama

A. F. Alsobrook, Five Points.—3,620 kw-hr. Lights, range, refrigerator, water pump for house and livestock.

L. C. Young, Montgomery.—15,328 kw-hr. Lights for home and dairy, refrigerator for home and one for dairy, water pump for home and dairy, milking machine.

Mrs. Kate McLean Stewart, Hope Hull.—14,040 kw-hr. Lights, both house and barn, range, refrigerator for dairy.

Aaron Fleming, Huntsville, Route No. 4.—3,777 kw-hr.

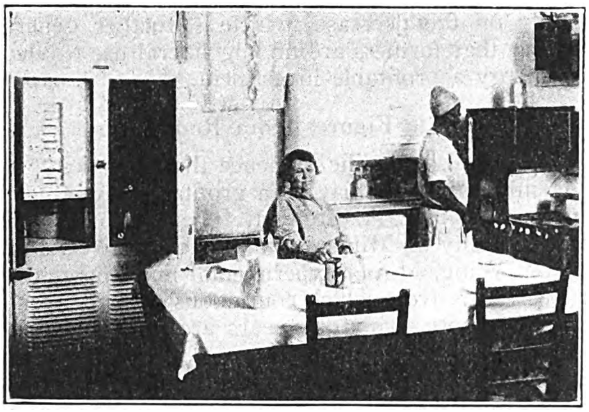

FIG. 1—COOL COOKING AND COOLING FOOD IN A FARMHOUSE IN SUNNY ALABAMA.

Range, refrigerator, water pump, motors in blacksmith shop, fanning mill for lespedeza seed, lights for home and barns.

Clarendon Davis, Huntsville, Route No. 2.—3,950 kw-hr. Lights for home and barns, range, refrigerator, water pump, water heater.

Arizona

S. K. Phillips, Phoenix, Route No. 7, Box 195.—4,218 kw-hr. Motor, range, refrigerator, iron, vacuum cleaner, waffle iron, percolator, 3 fans, sewing machine, lights.

M. B. Brooks, Phoenix, Route No. 4.—4,758 kw-hr. Milking machine, motor on water pump, washing machine, fan, sweeper, iron, range, lights.

LeRoy Butler, Phoenix, Route No. 3.—5,738 kw-hr. Motor, range, iron, washer, heater, refrigerator, lights.

J. W. Pendergast, Tolleson, Maricopa County, Route No. 1. 3,860 kw-hr. Milking machine, pump, washer, refrigerator, iron, fan, toaster, waffle iron, heater, lights.

Joseph Roer, Phoenix, Route No. 6.—3,326 kw-hr. Range, motors, washer, refrigerator, iron, fan, lights.

Arkansas

Chas. Lemaire Dairy Farm, Little Rock, Route No. 3.—3,761 kw-hr. Water system, milking machine, cream separator, small appliances.

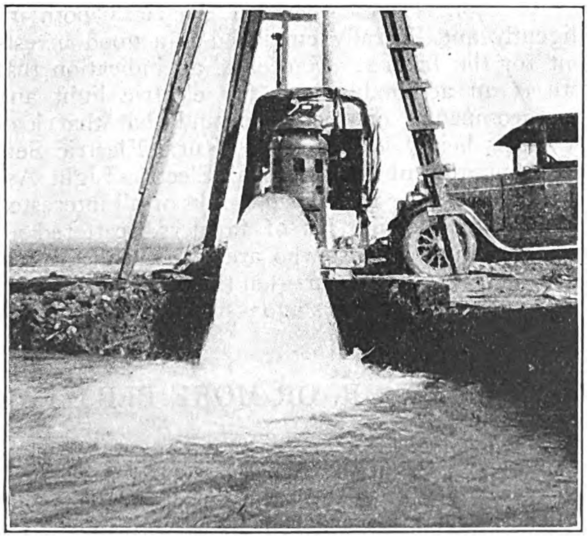

FIG. 2—160-ACRE ALFALFA IRRIGATION IN CALIFORNIA.

Ensminger Dairy, McGehee.—5,454 kw-hr. Refrigerator, range, separator, churn, water system, water heater, iron, percolator, radio.

Pickens Plantation, Walnut Lake.—30,131 kw-hr. Gin, grist mill, water pump, blacksmith shop, grinder, 2 water heaters, 2 ranges.

Gus Cash, Camden.—3,011 kw-hr. Pump, refrigerator, 3 fans, milking machine, cream separator, bottle washer.

H. C. Williamson, Earle.—14,285 kw-hr. Gin motor, water system, milk machine, refrigerator.

C. S. Douglass, Mablevale.—3,116 kw-hr. Milking machine, pump, bottle washer, household appliances.

R. A. Nelson, Mablevale.—3,809 kw-hr. Refrigerator, range, small appliances.

C. N. Alexander, North Little Rock, Route No. 4.—3,100 kw-hr. Refrigerator, pump, lights, household appliances.

A. L. Alexander, Scotts.—3,599 kw-hr. Refrigerator, pump, household appliances.

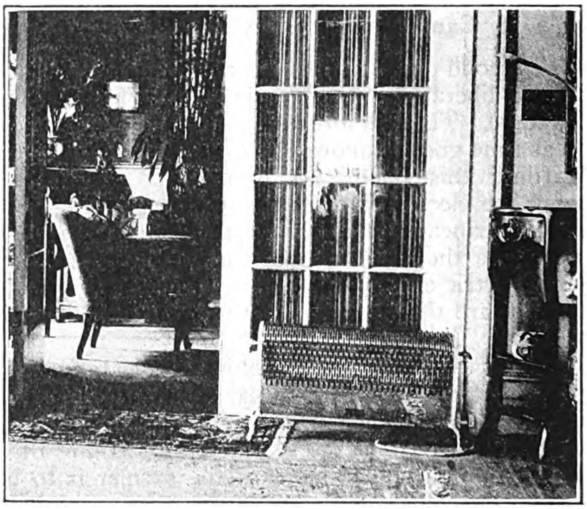

FIG. 3—EVEN A CALIFORNIA FARMHOUSE REQUIRES A LITTLE ELECTRIC HEAT.

California

LeRoy Anderson, WS SARA. Rd. 100' S. Doyle Rd., Santa Clara County, San Jose.—5,422 kw-hr. Range, air heater, pump, motor.

Andrew Christensen, ES San Antonio Rd. off Portola Ave., Santa Clara County.—14,420 kw-hr. Motor, irrigation pump, range, water heater, 3 air heaters.

H. Schwab, H.Str. Rd., Sacramento County.—9,130 kw-hr. Range, water heater, refrigerator, vacuum cleaner, toaster, iron, percolator.

Frank Dagostino, Folsom Rd., Sacramento County.—5,063 kw-hr. Motor, refrigerator, washing machine, range, water heater, iron.

C. W. Keele, District No. 10, Yuba County.—5,933 kw-hr. Motor, water heater, range, water pressure and irrigating yard, lights.

Ray Chandler, Yuba City, Sutter County.—8,699 kw-hr. Motor, range, water heater, refrigerator, lights.

D. A. Alexander, Linda District, Yuba County.—7,410 kw-hr. Irrigating, pressure system, grindstone, range, water heater, electric heating, lights.

Henry Clausen, Gonzales, Monterey County.—12,693 kw-hr. Irrigating, water heater, range, dairy sterilizer, lights.

Vierra Bros., Salinas-Chualar River Rd., 7 miles south of Salinas, Cal., Monterey County.—60,375 kw-hr. Irrigating only.

H. A. Sellers, Firebaugh, Fresno County.—12,921 kw-hr. Irrigating, water heater, range, heater, refrigerator.

A. R. McGuire, Mendota, Fresno County.—15,042 kw-hr. Irrigating, range, water heater, 2 air heaters.

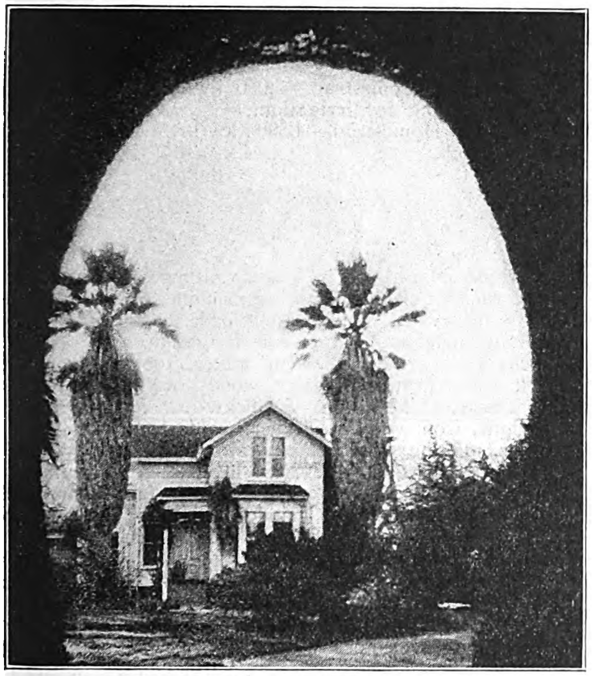

FIG. 4—A CALIFORNIA ELECTRIFIED FARMHOUSE.

M. S. Meeker, Fresno County, Kerman.—4,293 kw-hr. Irrigating, range, water heater, air heater.

Sanborn Young, Fresno County.—15,892 kw-hr. Irrigating, water heater, cooler, milker, sterilizer, range, water system.

Frank Andrews, Fresno County.—13,265 kw-hr. Range, 3 motors, water heater.

M. R. Knauft, Walnut.—8,174 kw-hr. Irrigating, walnut dehydrator, range, water heater, refrigerator, fan, piano, radio, drink mixer, air heater.

P. C. Huddleston, Magnolia Rd., North of Katella, Orange County—3,567 kw-hr. Irrigating, range, water heater, refrigerator, ironer, water pump, 2 heaters, washing machine, plate, battery charger and eliminator, percolator, toaster, vacuum cleaner, iron.

J. A. Ragle, Box 275, Woodlake.—3,368 kw-hr. Irrigating, range, water heater, motor, percolator, iron, washing machine.

Herrold Gist, Tulare County, Tulare.—Owner meter 7,414 kw-hr.; tenant meter, 4,696 kw-hr. 3 motors for irrigation pumping, (owner) range, water heater, servel, air heater, single phase motor, DeLaval separator, fan, washing machine, iron, percolator, vacuum cleaner, toaster, grill, waffle iron. (Tenant) range, washing machine, hedlite heater, percolator, iron, waffle iron, refrigerator, pad, fan.

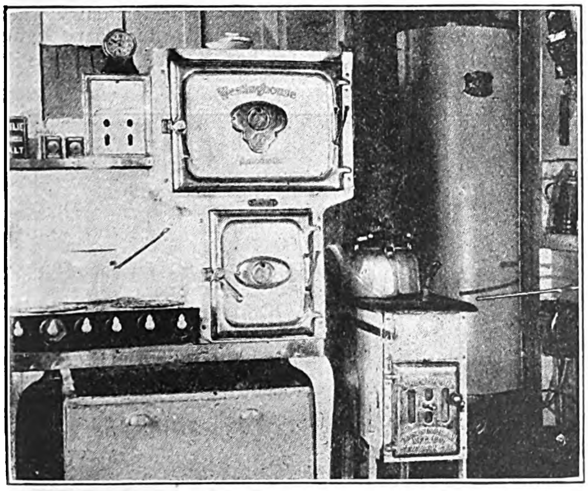

FIG. 5—ELECTRICITY WORKS IN THE KITCHEN OF A CALIFORNIA FARMHOUSE.

Colorado

Lloyd Fahrney, Olathe.—4,067 kw-hr. Incubator, sells day old chicks. Kw-hr. used through lighting meter includes several lamps used for heating incubators, lights 5 room house and hatchery room, fans.

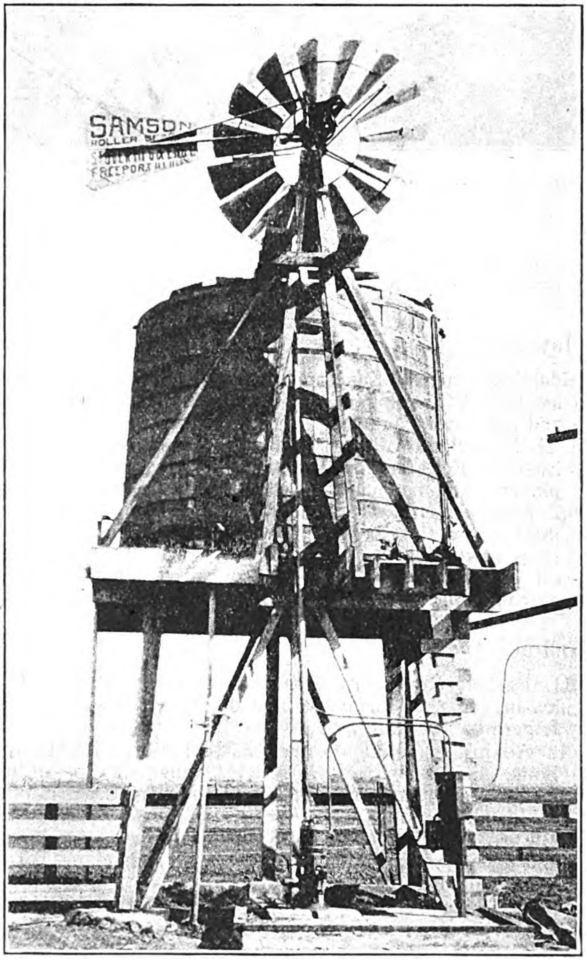

FIG. 6—THIS 3-HP. TURBINE PUMP ON A CALIFORNIA FARM DOES THE HALF-DAY WORK OF A WINDMILL IN TWENTY MINUTES.

Connecticut

R. C. Wetherell, Suffield Rd., Suffield, Conn.—5,852 kw-hr. Washer, iron, ironer, toaster, percolator, 2 refrigerators, milking machine.

A. H. Grant, Melrose, Broad Brook.—6,389 kw-hr. Toaster, iron, percolator, grill, washer, milking machine, refrigerator, water pump.

Geo. M. Hendee, Mapleton Ave., Suffield.—19,445 kw-hr. Milking machine, 2 refrigerators, hay hoist, clippers, separators, range.

A. B. Thompson, Main St., Melrose.—4,203 kw-hr. Range, refrigerator, oil burner, all table appliances, cleaner, washer, sump pump, water pump.

H. C. Welles, Scantic.—4,119 kw-hr. Range, refrigerator,

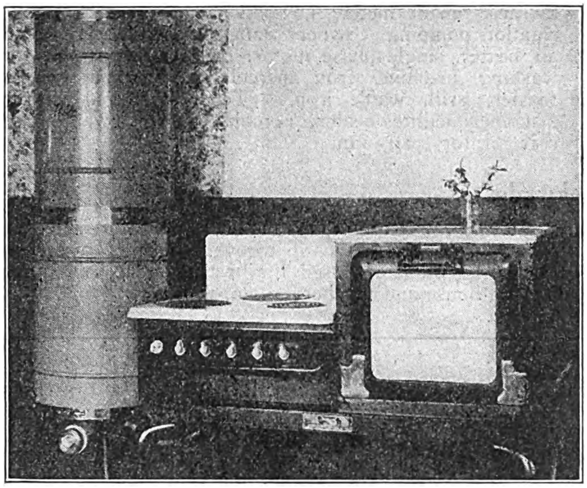

FIG. 7—MANY CALIFORNIA FARMHOUSES USE ELECTRICITY FOR WATER HEATING AND COOKING.

iron, toaster, percolator, chafing dish, heating pad, pump, milking machine, another refrigerator in dairy.

Delaware

Breidablick Farms, Lancaster Pike, Wilmington.—21,849 kw-hr. Water pump, ice machine, circulating pump, and separator, 2 milking machines, lights.

Col. H. F. duPont, Winterthur Farms, Winterthur.—216,188 kw-hr. Feed mixer, ammonia compressor, saw and planer, 2 pumps, 3 hay hoists, fan exhaust, elevator, 2 fan exhausts, water pump, milk conveyor, washing machine, pasturizer, churn, extractor, wringer, repair shop motors, brine pump, laundry machine, separator, oil burners, refrigerator, ice cream freezer, chipping machine, lights.

Florida

J. H. Barber, Route No. 3, Box 411, Ferry Pass.—7,080 kw-hr. Lights for house and dairy, water system, refrigerator for dairy.

T. L. Adkinson, Myrtle Grove.—3,384 kw-hr. Lights for home and dairy, water system, range, 1 hp. utility motor, 3 hp. feed grinder, 1½ hp. dairy refrigerator to be installed soon.

H. P. Caro, Myrtle Grove.—8,352 kw-hr. Lights for house and dairy, water system, range, washing machine, bottle washer, churn, cooling system.

Fairglades Dairy, Donato Bufano, Prop., Kendall.—50,846 kw-hr. Lights, range, water pumping, dairy power, ice crusher, bottling machine, compressor, brine pump, line shaft.

Dr. J. Peterson, Homestead.—3,000 kw-hr. Lights, range, water pumping for irrigation.

C. S. Allen, Homestead.—4,500 kw-hr. Lights, range, water pump.

Georgia

Idaho

J. F. Bruins, Boise.—5,296 kw-hr. Range, water heater, iron, vacuum cleaner, washing machine, sewing machine, air heater, radio, fan, heating pad, toaster, percolator, milking machine, pump for irrigation and watering stock, feed grinder, cement mixer, tool grinder, hay fork, water heater for dairy, wood saw.

Harold Davidson, Meridian.—5,420 kw-hr. Range, washing machine, iron, vacuum cleaner, waffle iron, fan, 1½ hp. motor, milking machine, separator and pump.

R. M. White, Meridian.—3,312 kw-hr. Range, washing machine, iron, water heater, air heater, fan, 3 brooders, 3 incubators, 2 hp. feed grinder and 1 hp. pump.

G. A. Koger, Meridian—8,940 kw-hr. Range, washing machine, iron, battery charger, ½ hp. motor on pump, ¼ hp. separator, 1 hp. honey extractor, 500-watt heater in poultry house and 3 brooders.

Fay Davis, Parma.—14,090 kw-hr. Iron, washing machine, range, water heater, water system, vacuum cleaner, curling iron, lighting of barn, yard, poultry house, incubator and brooder, pump.

H. Solterbeck, Payette.—14,794 kw-hr. Range, iron, washing machine, 2 water heaters, fan, percolator, water system, milking machine, separator, bottle washer, outside lighting.

Archie Larson, Weiser.—18,572 kw-hr. Range, water heater, sweeper, iron, toaster, radio, cozy glow heater, water system, sewing machine, feed grinder, hay cutter, separator, lights in barn, henhouse and yard.

H. W. Hume, Wilder.—6,382 kw-hr. Iron, washing machine, range, toaster, waffle iron, table appliances, vacuum cleaner, fan, water system, refrigerator, sewing machine, incubator, brooder, separator, milking machine, shop grinder, shop motor, utility motor, lights in barn, yard, and poultry house.

O. E. Peret, Wilder.—4,110 kw-hr. Iron, washing machine, range, water heater, toaster, waffle iron, percolator, vacuum cleaner, fan, refrigerator, water system, barn, yard and poultry house lighting, utility motor.

Walter Little, Boise.—7,715 kw-hr. Water heater, range, iron, ironer, washer, percolator, vacuum cleaner, toaster, waffle iron, commercial pump, lights.

Mye & Buchanan, Jerome.—7,101 kw-hr. Range, urn, vacuum cleaner, washer, iron, water heater, dairy water heater, separator, water system, house and barn lights.

W. F. Thode, Boise.—5,319 kw-hr. Lights, iron, washer,

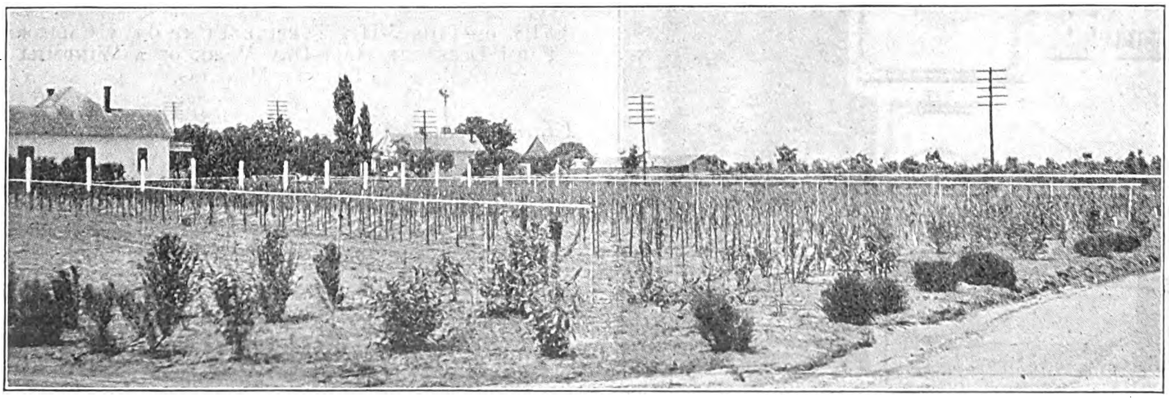

FIG. 8—WHEN BULBS ARE THIRSTY, ELECTRICITY MAKES IT RAIN IN GEORGIA.

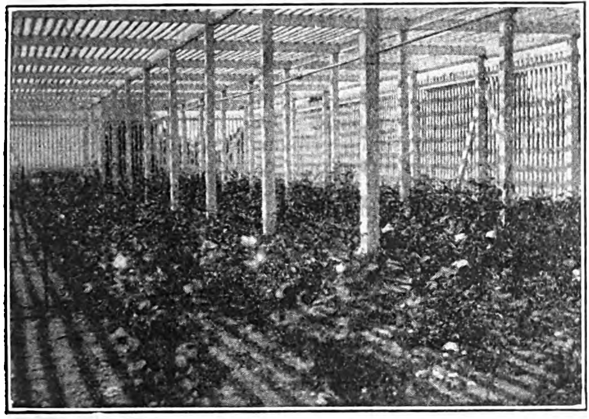

FIG. 9—ELECTRICITY PROVIDES OVERHEAD IRRIGATION TO MAKE ROSES BLOOM IN GEORGIA.

range, water heater, air heater, waffle iron, vacuum cleaner, sterilizer, bottle washer, utility motor.

Henry Hege, Aberdeen.—6,004 kw-hr. Range, washer, milking machine, iron, water system, vacuum cleaner, curler, toaster, vibrator, lights, water heater, warming pad, feed grinder, utility motor.

Mike Barclay, Blackfoot.—12,491 kw-hr. Iron, washer, range, water heater, air heater, toaster, waffle iron, percolator, vacuum cleaner, refrigerator, water system, sewing machine, ironer, curling iron, radio, lights in house, barn, poultry house and yard.

W. E. Cleveland, Twin Falls.—3,669 kw-hr. Range, milker, washer, separator, iron, toaster, percolator, water system, house and yard lights.

Eli Simmons, Ucon.—3,521 kw-hr. Lights and range.

Herman Erickson, Route No. 1, Thornton.—3,296 kw-hr. Lights, range, pumping.

Rudolph Nelson, Route No. 1, Firth.—3,034 kw-hr. Lights, range, refrigerator, motor for pumping water.

Dan Bucklund, Idaho Falls, Route No. 4.—4,262 kw-hr. Lights, range, motor for pumping water.

Fred Anderson, care of Elmer Anderson, Idaho Falls, Idaho Route No. 4.—3,750 kw-hr. Lights, range, motor for pumping water.

Illinois

A. F. Randolph, Canton.—4,316 kw-hr. Iron, cleaner, washer, milker, 2 pumps, toaster, range, separator.

Jeptha Randolph, Canton.—3,780 kw-hr. Iron, range, washer, pump, milker, separator, sewing machine.

Marion Lawson, Norris.—5,914 kw-hr. Battery charger, iron, range, cleaner, washer, water system.

Charles Rock, Norris.—3,000 kw-hr. Iron, cleaner, range.

Clyde Eshelman, Norris.—4,200 kw-hr. Iron, range, cleaner, washer, water system, 2 pumps.

Howard Smith, Bardolph.—3,000 kw-hr. Range, iron, washer.

Indiana

M. J. Schlarb, Goshen.—5,727 kw-hr. Pump, iron, milking machine, bottle washer and miscellaneous power, refrigerator.

Daniel Bechtel, Goshen.—3,290 kw-hr. Milking machine, pump, washing, ironing, cook range, sweeper, incubator, automatic clock on chicken house.

C. M. Enders, Goshen.—3,596 kw-hr. Pump, washer, iron, refrigerator, cream separator, general power, milking machine.

Mervin Eby, Goshen.—5,758 kw-hr. Pump, washer, iron, refrigerator, separator, general power, milking machine, feed grinder, range, silo filler.

Cedric Adams, Goshen.—3,410 kw-hr. Cooking, lights in henhouses, pumps, water.

Alderman Farm, Goshen.—4,049 kw-hr. Pump, 2 ranges, hot water heater, grinder, general utility motor, lights, brooders, special heaters for fruit storage.

J. B. E. LaPlant, Vincennes.—8,000 kw-hr. General farming.

H. D. Simpson, Vincennes.—7,000 kw-hr. 120 acres, orchard and nursery.

Geo. Armstrong, Vincennes.—3,000 kw-hr. General farming.

Wm. R. Lapsley, Vincennes.—4,000 kw-hr. Truck and poultry farm, completely electrified.

Phillip Ramsey, Vincinnese.—3,000 kw-hr. 160 acres, general farming.

Eugene Reibel, Vincennes.—3,000 kw-hr. 120 acres, general farm.

Frank Tellman, Columbus.—4,800 kw-hr. 346 acres, general farming.

Paul Jones, Columbus.—4,800 kw-hr. General farming.

W. H. Graffis, Monticello.—4,195 kw-hr. 320 acres, general farming.

Capper Stock Farm, Monticello.—5,480 kw-hr. Large stock farm.

Stephens Hatchery, Monticello.—3,000 kw-hr. Hatchery and poultry farm.

Iowa

Paul Kilburn, Route No. 3, Mt. Vernon.—4,300 kw-hr. Refrigerator, water pump, water heater, such small power as you would find around average farm.

Mike Sproles, Garner.—3,857 kw-hr. Refrigerator, water pump, water heater, small power uses.

W. C. Tyell, Bellemont.—3,745 kw-hr. Refrigerator, water pump, water heater, small power uses.

Mike Scalario, Route No. 4, Cedar Rapids.—3,355 kw-hr. Refrigerator, water pump, water heater, small power uses.

Henry Grunewalt, Blairstown.—3,102 kw-hr. Refrigerator, water pump, water heater, small power uses.

Clarence Lawhorn, Garner.—3,054 kw-hr. Refrigerator, water pump, water heater, small power uses.

Kansas

J. Fred Miller & Sons, Larned.—4,097 kw-hr. Milking machine, bottle washer, cream separator, running water, lights, elevating, grinding and mixing equipment, water pumping, washing machine, ironer, vacuum cleaner, hot plate, fan, lights.

A. L. Stockwell, Larned.—3,091 kw-hr. Feeding operations, irrigation pumps, lights in house and barns, water system, grain and forage mill equipped with elevating attachment, silo filling and pumping water, range, refrigerator, ironer, vacuum cleaner, space heater, fan,

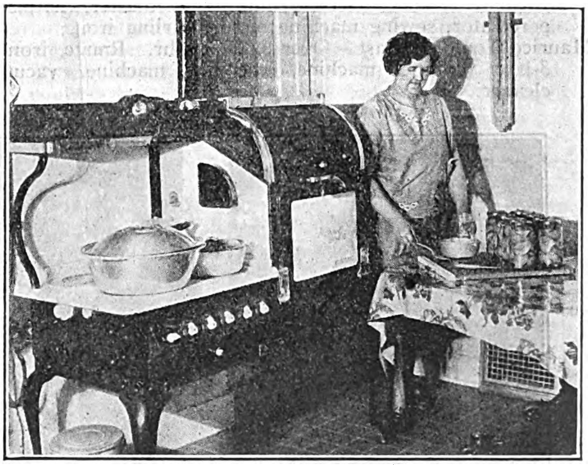

FIG. 10—WITH ELECTRICITY AVAILABLE THE FRUIT CANNING SEASON IS A PLEASANT ONE FOR THIS IDAHO FARM HOMEMAKER.

table stove, radio, washing machine, cream separator, emery wheel.

J. M. Lewis, Larned.—3,722 kw-hr. Light, range, water heater, refrigerator, water system, washer, ironer, iron, vacuum cleaner, fan, radio, cream separator, lights for house and barns, motor for shop equipment, pumping water, grinding and elevating grain, silo filling, irrigation pumping.

Roy A. Robinson, Larned.—3,078 kw-hr. Lights, washing machine, water system, range, toaster, waffle iron, refrigerator, fan, vacuum cleaner, battery charger, washing machine in 2 houses, cream separator, motor on air compressor, emery wheel, drill, motor for grinding, cleaning and elevating grain, pumping water.

L. L. Lupfer, Larned.—3,450 kw-hr. Lights, range, toaster, waffle iron, washer, iron, vacuum cleaner, water system, space heater, incubator, motor driven churn, ice-cream freezer, cellar-sump pump, radio charger, cream separator, elevating and grinding feed, water heater, refrigerator, ironer, floor waxer, motor for lineshaft driving drill, grindstone, air compressor and circular saw, portable electric drill, portable milking machine.

Fred B. Reed, Larned.—3,961 kw-hr. Lights, milking machine, cream separator, water pump all operated by individual motors; range, vacuum cleaner, washing machine, iron, fan, sewing motor, water system.

Kentucky

C. M. Camden, Varsailles, on Frankfort Pike.—33,620 kw-hr. Pumping, lights, water heating, cutting and grinding (has in excess of 50 h.p. in motors).

Louisiana

W. J. Perkins, Mansfield Road, Shreveport.—3,143 kw-hr. Pump, refrigerator, milker, small appliances.

Roemer Farm, Taylortown Road, Shreveport.—3,693 kw-hr. Pump, refrigerator, milker, cream separator.

W. E. Hamilton, Taylortown Road, Shreveport.—6,250 kw-hr. Pump, refrigerator, milker, cream separator.

A. L. Alexander, Greenwood Road, Shreveport.—7,907 kw-hr. Pump, refrigerator, milker, cream separator.

Maine

W. H. Burgess, Sanbornville.—Over 3,000 kw-hr. Range, water heater, 1-h.p. motor for milking, water pumping, cutting bone, turning grindstone, etc., washing machine, iron, sewing machine motor.

Fred J. Wood, Topsham.—Over 3,000 kw-hr. Water heater, ½-h.p. water pump, iron, small household appliances.

R. A. Rackley, Topsham.—Over 3,000 kw-hr. Range, washing machine, 5-h.p. utility motor, iron, water heater, refrigerator, milking machine, water pump, milk cooler, vacuum cleaner, electric fan, iron, toaster, hotplate, percolator, sewing machine motor, curling iron.

Maurice Toule, Belfast.—Over 3,000 kw-hr. Range, ironer, 3-h.p. milking machine, washing machine, vacuum cleaner.

Frank H. Richardson, Lewiston.—Over 3,000 kw-hr. Range, water heater, refrigerator, deep well pump, milk separator, cooler, milking machine.

R. G. Lowell, Greene.—Over 3,000 kw-hr. Milking machine, water pump, small household appliances.

E. C. Buzzell, Fryeburg.—Over 3,000 kw-hr. 7½-h.p. motor for threshing, grinding, wood sawing, silo filling and general utility work, electric pump, washing machine, iron, small household appliances, range and refrigerator being installed.

Maryland

Geo. W. White, S. S. Sweathouse Road, 1 E. Harford Road, Mt. Vista, Harford County.—10,911 kw-hr. Range, milking machine, 20-h.p. motor, 2-h.p. for water pumping.

Janon Fisher, W. S. Park Heights Ave., 1 N. Caves Road. Eccleston.—9,748 kw-hr. Milking machine, water pump, range.

J. Edwin Griffith, W. S. Pimlico Road, 5 N. Smith Ave., Mt. Washington.—6,181 kw-hr. Stock farm, lights.

Samuel H. Shoemaker, N. S. Valley Road, 1 W. Park Heights Ave., Eccleston.—33,213 kw-hr. Dairy farm completely electrified.

Wallace W. Lanahan, E. S. Pitts Road, 3 N. Cinder Road, Timonium.—42,406 kw-hr. Range, refrigerator, water pump, small motors for general use.

Geo. Zaiser, W. S. Maiden Choice Lane, 1 S. McTavish Ave., Catonsville.—18,697 kw-hr. Range, 2 motors on milking machine, ice machine, 10-h.p. utility motor, small motors on bottle washers and bottling machines, water pumps.

Geo. Knapp, W. S. Rolling Road, 1 S. Bloomsbury Road, Catonsville.—22,276 kw-hr. Refrigerator, bottle washer bottle machine, water pump.

Massachusetts

Manuel S. Leal, Jr., Raymond Road, Burlington.—5,477 kw-hr. Incubator, range, refrigerator, water pump, portable saw, 6 brooders, lights for poultry house.

Edyth W. MacIntosh, Richards Street, Sharon.—7,000 kw-hr. Incubator, 6 brooders, lights.

Donald Macomber, Bedford Road, Lincoln.—8,914 kw-hr. Range, refrigerator, incubator, lights, mangle.

C. B. Tillson, E. Plain St., Jct. E. Pond St., Cochituate.—3,685 kw-hr. Incubator, small appliances, lights.

Geo. W. Sarano, Lincoln St. cor. State Road, Lexington.—4,022 kw-hr. Refrigerator, small appliances, incubator, lights.

Charles H. Miller, Lincoln St., near School, Lexington.—7,430 kw-hr. Range, refrigerator, small appliances, mangle, lights, incubator.

Michigan

E. J. Bidigard, Route No. 4, Monroe.—3,265 kw-hr. Iron, washer, water system, range, sweeper, pump.

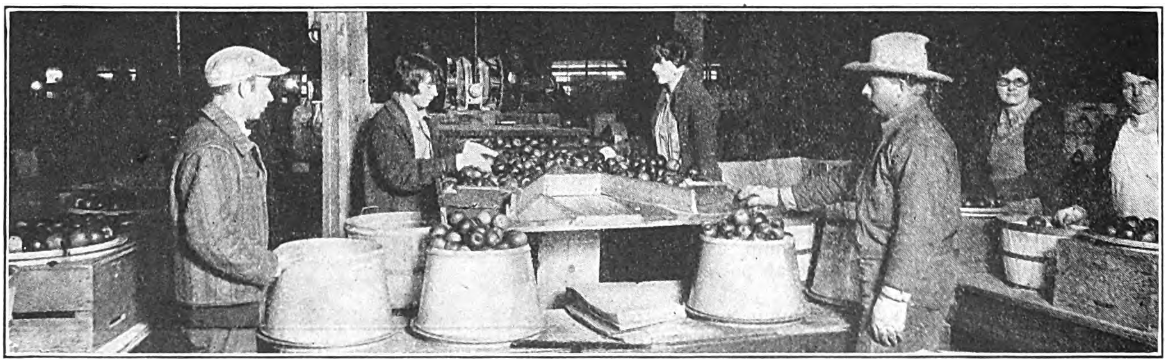

FIG. 11—AN ELECTRICALLY OPERATED MACHINE WHICH SORTS, WASHES AND PACKS APPLES ON AN IDAHO RANCH.

John Leppel, Route No. 1, Monroe.—3,241 kw-hr. Iron, range, sweeper, washer, water system, cider mill, pump.

G. H. Wood, Route No. 2, Monroe.—7,265 kw-hr. Large dairy, sells bottled milk. Iron, range, refrigerator, sweeper, washer, 2 water systems, cream separator, bottle washer, bottler, ice machine, grinder, water pump.

Fred C. Blume, S. Custer Road, Monroe.—3,040 kw-hr. Iron, range, sweeper, washer, water system.

Ernest Wright, Route No. 2, Monroe.—3,024 kw-hr. Iron, milker, range, sweeper, washer, water pump, water system.

Albert W. Miller, S. Custer Road, Monroe.—5,418 kw-hr. Iron, refrigerator, range, sweeper, washer, 2 water systems, brooder, drill, feed grinder, incubator, milk cooler, paint spray, pump jack, tool ginder, 2 motors.

Marshall Buckberry, Romulus—3,283 kw-hr. Iron, range, ice refrigerator, sweeper, washer, 2 water systems.

E. W. Christner, Saline.—4,007 kwhr. Iron, range, refrigerator, sweeper, washer, 2 water systems.

L. E. Wiard, Route No. 2, Ypsilanti.—5,006 kw-hr. Refrigerator, iron, range, sweeper, washer, 2 water systems.

Roy Wilkie, Route No. 2, Ypsilanti.—4,193 kw-hr. Refrigerator, iron, range, sweeper, washer, water system, milker, motor for general use, 2 water pumps.

G. W. Slaughter, Route No. 1, Ypsilanti.—4,304 kw-hr. Refrigerator, iron, range, sweeper, washer, water system, blower, 2 oat crushers, water pump.

F. Palma, Route No. 1, Ypsilanti.—38,008 kw-hr. Refrigerator, iron, range, sweeper, washer, water system, bottle washer, bottler, feed grinder, ice machine.

J. S. Lathers, Route No. 2, Ypsilanti.—6,806 kw-hr. Iron, range, sweeper, washer, water system, milker.

Fred J. Korte, Route No. 4, Ypsilanti.—3,333 kw-hr. Iron, range, sweeper, washer, 2 water systems, milker, utility motor.

Knudt Jorgensen, Route No. 3, Ypsilanti.—6,044 kw-hr. Refrigerator, iron, range, sweeper, 2 water systems, milker.

Wm. Honck, Route No. 3, Ypsilanti.—4,112 kw-hr. Iron, sweeper, washer, 2 water systems.

Edw. D. Foster, Route No. 3, Ypsilanti.—4,001 kw-hr. Refrigerator, iron, range, sweeper, 2 water systems, washer.

L. F. Field, Route No. 3, Ypsilanti.—4,325 kw-hr. Iron, sweeper, washer, water system, 2 incubators, water pump.

John Bagley, Route No. 5, Ypsilanti.—5,755 kw-hr. Refrigerator, iron, milker, range, sweeper, washer, 2 water systems.

F. M. Robbins, Saline.—3,151 kw-hr. Refrigerator, iron, range, sweeper, washer, water pump, water system.

Bolgos Bros., Route No. 5, Ann Arbor.—6,845 kw-hr. Refrigerator, iron, sweeper, washer, water system, bottler, milker, separator, water pump.

W. W. Davis, Route No. 1, Ann Arbor.—4,001 kw-hr. Iron, range, sweeper, washer, water system, water pump, motor on pumps.

H. George Field, Route No. 5, Ann Arbor.—6,347 kw-hr. Refrigerator, iron, range, sweeper, washer, 2 water systems, water heater, 2-h.p. on pumps at barn.

Geo. Aprill, Route No. 4, Ann Arbor.—3,561 kw-hr. 2 ice refrigerators, iron, range, sweeper, washer, 2 water systems, churn, cider mill, feed grinder, separator.

V. C. McNitt, Route No. 4, Ann Arbor.—4,563 kw-hr. Refrigerator, iron, range, sweeper, 2 water systems.

A. Haener, Route No. 5, Ypsilanti.—3,329 kw-hr. Iron, range, sweeper, water pump, water system.

M. C. Britz, Route No. 5, New Boston.—3,719 kw-hr. Refrigerator, iron, range, sweeper, washer, water system.

Charles Joh, Hall Road, Mt. Clemens.—8,040 kw-hr. Iron, range, refrigerator, sweeper, toaster, washer, water pump.

Fred W. Knack, Armada Ridge Road, Armada.—3,991 kw-hr. Iron, lights, range, sump pump, water pump.

Sidney N. Lagatree, Armada Ridge Road, Armada.—3,230 kw-hr. Iron, lights, range, washer, water pump.

Alex. Campbell, 12 Mile Road, Centerline.—4,543 kw-hr. Iron, percolator, range, refrigerator, sweeper, toaster, tool grinder, washer, water pump.

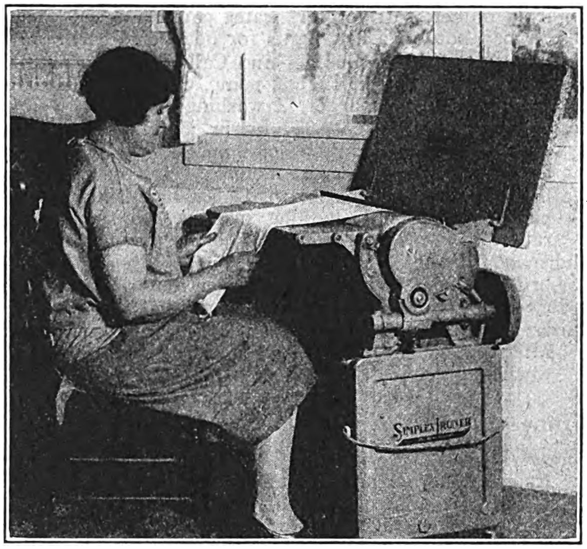

FIG. 12—HOUSEWORK IS DONE ELECTRICALLY IN THIS IDAHO RANCH HOUSE.

Paul Filo, 14 Mile Road, Centerline.—3,985 kw-hr. Iron, range, sweeper, washer, 2 water pumps.

John C. Busch, Ryan Road, Centerline.—3,612 kw-hr. Iron, range, sweeper, toaster, tool grinder, washer, water pump.

Erie Hallin, S. Gratiot Ave., Roseville.—3.799 kw-hr. Range, iron, refrigerator, sign at road, sweeper, waffle iron, water pump.

A. Gabler, Quick Road, New Baltimore.—5,224 kw-hr. Brooder, iron, incubator, toaster, washer, water pump.

Thomas D. Murphy, E. S., Auburn Road, Utica.—4.413 kw-hr. 3 brooders, incubator, iron, 6 poultry water heaters, lights, washer, water pump.

W. J. Boehmer, 15 Mile Road, Utica.—3,239 kw-hr. Iron, range, percolator, sweeper, toaster, washer, 2 water pumps.

Carl Schoonover, E. S., Ryan Road, Utica.—5,017 kw-hr. Cooker, iron, milking machine, range, toaster, washer, water pump.

Norbert Schwartz, Townline Road, Utica.—3,764 kw-hr. Iron, range, sweeper, washer, 2 water pumps.

Charles W. Stevenson, Griswold Road, Pt. Huron.—4,195 kw-hr. Iron, milking machine, range, refrigerator.

D. C. Griggs, W. St. Clair St., Romeo.—4,765 kw-hr. Grader, hotplate, ironer, range, refrigerator, sweeper, washer, water heater, 2 water pumps.

W. A. Downs, Romeo.—11,533 kw-hr. Air heater, fans, iron, 8 poultry water heaters, range, refrigerator, sweeper, toaster, washer, water heater, water pump.

J. B. Deneen, Imlay City.—7,894 kw-hr. 6 brooders, hotplate, incubator, poultry house lights, toaster, water circulator, water pump.

Ira Wilson, Fowlerville.—24,336 kw-hr. Brine pump, compressor, milker, range, water system.

M. J. McPherson, Howell.—5,100 kw-hr. Bottle washer, water system.

B. B. Soults, Milford.—3,288 kw-hr. Heaters, lights for fox pen.

Frank Nichols, Orchard Lake Road, Farmington.—4,860 kw-hr. Refrigerator, iron, range, sprinkler system, sweeper, washer, water system.

Charles Halstead, Halstead Road, Farmington.—3,072 kw-hr. Refrigerator, iron, range, sweeper, washer, water system.

J. McMullen, Hemlock.—7,150 kw-hr. Chicken hatchery.

J. W. Fordney, Hemlock.—25,383 kw-hr. Dairy, 240 acres.

Balmoral Farms, Ithaca.—11,561 kw-hr. Dairy, 200 acres.

L. J. Bradley, Route No. 2, Augusta.—5,017 kw-hr. Range.

iron, milker, refrigerator, water pump, washer, vacuum cleaner, bottle washer, lights for house and barn.

D. D. Aitkin, Cor. of Beecher and Calkins Rd. (Flint District).—8,600 kw-hr. Lights, pump, clippers, milk cooler, washer, battery charger, 2 washing machines, 2 irons.

Benj. Hachett, Jenison.—9,350 kw-hr. 3 milking machines, clippers, pump, cornsheller, pumps, radio, washer, toaster, 2 irons, sweeper, motor.

Wallinwood Farms, Jenison.—6,814 kw-hr. Bottle washer, pump, refrigerator, milking machine, emersion heater, range, iron, sweeper, separator, brine pump.

Thornwood Farms, Ada.—5,752 kw-hr. 2 bottle washers, brush, separator, oil burner, cooler motor, water pump, ice machine, milking machine, iron.

Burroughs Farm, Sheridan Road, Saginaw.—3,244 kw-hr. Milking machne, water pump, 2 vacuum cleaners, 2 washers.

Minnesota

Christ Theisen, Watkins.—3,339 kw-hr. 80 acre farm. Range, pump, cream separator, washing machine, lights.

Epple Bros., Montrose.—3,140 kw-hr. 275 acre farm. Operate feed mill, milking machine, pump, washing machine, iron, lights.

Hubert Hengle, St. Michael.—Over 3,000 kw-hr. Range, water heater, cream separator, milking machine, washing machine, iron, lights.

Moose Valley Farm, Duluth.—Over 3,000 kw-hr. (Theo. Holister, owner.) Lights, water pump, cream separator, feed grinder, washing machine, vacuum cleaner, iron, miscellaneous household appliances.

Lester River Dairy, Andrew Anderson, owner, Duluth.—3,791 kw-hr. Lights, milking machine, bottle washer, cream separator, pressure water system, washing machine, vacuum cleaner, miscellaneous household appliances.

Marshall Farm, Seth Marshall, owner, Duluth. — 11,909 kw-hr. Milking machine, bottle washer, cream separator, cow clipper, refrigerator dairy cooler, iron, water system, shop motor, range, washing machine, vacuum cleaner, miscellaneous household appliances.

Kenneth W. Thompson, Long Lake.—3,000 kw-hr. Range, pump, iron, washing machine.

Sandeen Bros., Maple Plain.—5,000 kw-hr. Lighting resort, pumping.

Northland Milk & Ice Cream Co., Anoka., Farm No. 1.—3,100 kw-hr. Milking machine, pump, lights, iron, washing machine.

Northland Milk & Ice Cream Co., Anoka, Farm No. 2.—4,300 kw-hr. Milking machine, pump, bottle washer, lights, iron, washer.

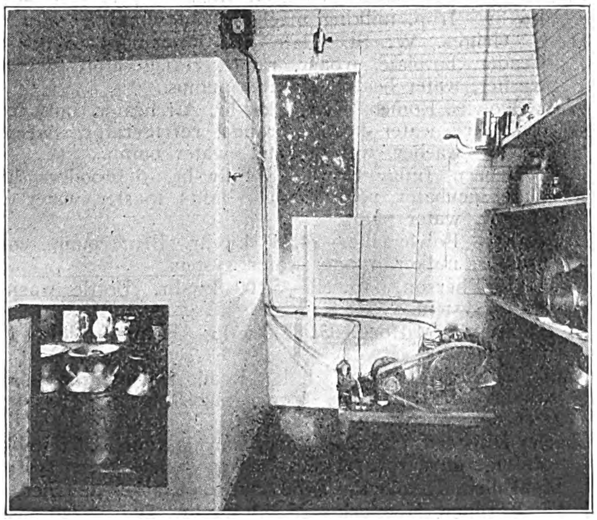

FIG. 13—ELECTRIC MILK COOLING ON A MINNESOTA FARM.

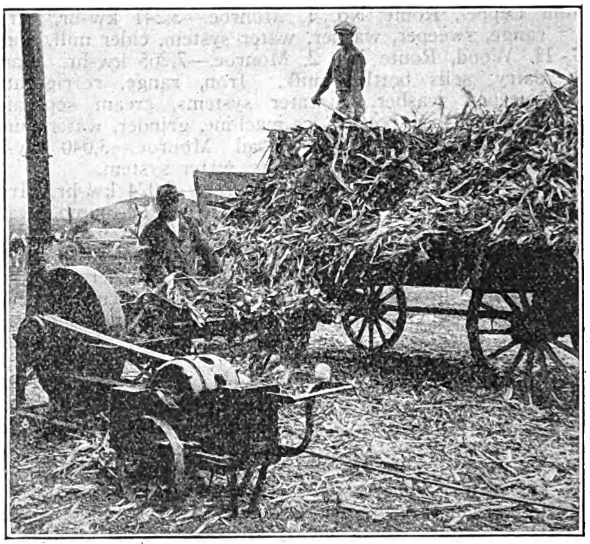

FIG. 14—7½-H.P. ELECTRIC MOTOR HANDLES SILO JOB ON A FARM IN MINNESOTA.

S. C. Campbell, Hopkins.—3,500 kw-hr. Water pump, lights, range, 7½-h.p. motor for filling 2 silos.

W. A. Johnston, Robbinsdale.—3,100 kw-hr. Pump, milking machine, lights in barn and in men's living quarters (no residence uses).

Wm. Moscrip, Lake Elmo.—13,700 kw-hr. Pump, milking machine, washing machine, iron, range.

Chas. E. Walker, Biscay.—6,000 kw-hr. Milking machine, battery, brooder, pump, lights, washing machine, iron.

D. G. Schwyzer, Bloomington.—12,000 kw-hr. Silo filling, feed and roughage grinding, range, dairy milk cooler, pump, water heater in house, iron, washing machine, lights.

Westwood Stock Farm, Farmington.—3,373 kw-hr. Milking machine, 2 pumps, 2-h.p. moors, 1¼-h.p. motor, lights, small appliances.

B. F. Bjornstad, Farmington.—7,014 kw-hr. Range, refrigerator, pump, milking machine, small appliances, lights.

Alice U. Nelson, Farmington.—3,553 kw-hr. Range, water system, washing machine, iron, lights.

Whitney Springhurst Farm, Farmington.—7,068 kw-hr. Milking machine, 7½-h.p. motor, feed mill, water system, washing machine, iron, lights.

Fred Cram, Waterville.—3,212 kw-hr. Range, water system, refrigerator, small appliances, lights.

J. J. Miller, Morristown.—4,493 kw-hr. Range, refrigerator, water system, lights, small appliances.

Henry Franzmier, Rich Valley.—7,063 kw-hr. Milking machine, silo filling and feed grinding, milk cooler, range, pump, lights, small appliances.

E. H. Knodt, Rich Valley.—3,048 kw-hr. Milking machine, silo filling and feed grinding, pumping, lights, small appliances.

Wm. Shuelke, Rosemount.—3,200 kw-hr. Range, refrigerator, lights.

Fred Yennie, West Concord.—3,206 kw-hr. Water system, water heater, range, lights, small appliances.

Wright A. Parkin, Mantorville.—3,145 kw-hr. Milking machine, water system, silo filling and feed grinding, range, small appliances, lights.

Mrs. Kate Fahlstrand, Herman.—3,616 kw-hr. Sewing machine, washing machine, iron, cleaner, cream separator, 2 milking machines, water pump, range, 5-h.p. motor.

Martin Melsness, Sacred Heart.—3,388 kw-hr. Water system, milker, fanning mill and grinder, cream separator, soft water system, range, iron, washer, vacuum cleaner, waffle ron, percolator, toaster.

W. A. Benham, Montevideo.—3,972 kw-hr. Feed grinder, milking machine, bottle washer, washer, iron, toaster and miscellaneous household appliances.

Ed. H. Ulrich, Biscay.—Over 3,000 kw-hr. Milking machine, 1-h.p. on Bulldozer pump, separator, soft water pump for house, washer, refrigerator, range, ironer, iron, vacuum cleaner, toaster, percolator, radio and sewing machine. Energy is also used for warming drinking water for chickens and forced laying of hens.

Werring & Johnson, Morgan.—Over 3,000 kw-hr. Milking machine, water pumping, separating, electric range, washer, iron, percolator, vacuum cleaner, toaster, fan.

Mississippi

A. P. Carney, Meridian.—11,144 kw-hr. Lights, refrigerator, water pump, milking machine.

J. H. Hardy, Crawford.—16,762 kw-hr. Lights for house and barns, water pump, feed mill, farm gin.

Geo. W. Ruff, Tupelo.—6,216 kw-hr. Lights, range, water heater, refrigerator, water pump.

Drumm Chicken Farm, Richburg Hill, Hattiesburg.—21,552 kw-hr. Lights, water pump, electric brooders.

James Evans, Muldon.—12,288 kw-hr. Lights, water pump, 20-h.p. motor for feed mill, silage cutter and hay press.

Missouri

Aubrey Fellows, Salisbury.—5,000 kw-hr. Poultry raising, range, refrigerator, washing machine, iron, percolator, water pump, vacuum cleaner.

R. E. Brown, Moscow Mills.—11,000 kw-hr. Milking machine, feed grinding, range, iron, washing machine.

H. S. LeCompte, Springfield.—3,205 kw-hr. Range, refrigerator, percolator, washing machine, vacuum cleaner, separator, water pump, radio.

F. W. French, Springfield.—6,354 kw-hr. Milking machine, water system, hot plate.

M. F. Duvall, Clarksville.—4,790 kw-hr. Storage box for milk, motor driven churn and pasturizer, water system, milking machine, grinding outfit, refrigerator, washing machine, iron, toaster, range.

Montana

Nebraska

E. H. Sprague, Waterloo.—8,350 kw-hr. Lights, in home, employees' house, barn, hog house, chicken coop, range, refrigerator, water system, with troughs in cowbarn, cream separator, motor on feed grinder, household appliances.

Carlton B. Noyes, Waterloo.—18,000 kw-hr. Lights, household appliances, water system, milking machine, bottle washer and cleaner, fans, ironing machine, milk cooler, refrigerator, expect to install range.

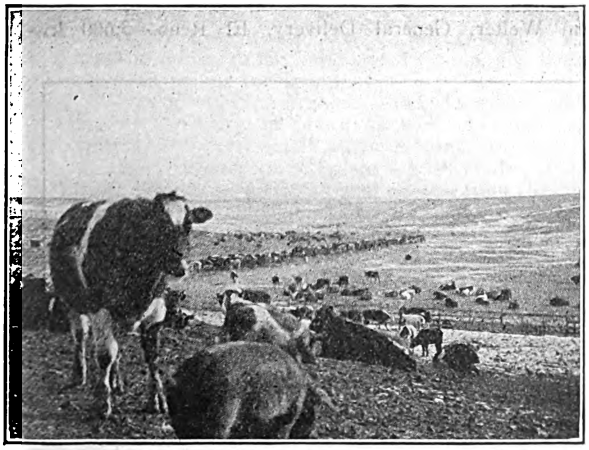

FIG. 15—A DAIRY FARM IN NEBRASKA WHICH USED 11,769 KW-HR. IN 1928.

Rapp Bros., Waterloo.—3,750 kw-hr. Motor, lights, household appliances, water pump, brooder, ironer.

Fritz Ackerlund, Route No. 1, Valley.—5,000 kw-hr. Elevator, water pumps, refrigerator, lights, household appliances.

J. P. Jensen, Route No. 6, Omaha.—10,000 kw-hr. Range, water heater, household appliances, lights in house and outbuildings, water system, refrigeration for milk cooling.

R. E. Krebb, Route No. 4, South Omaha.—3,020 kw-hr. Lights, household appliances, washing machine, vacuum cleaner, heater, toaster, iron, lamps, refrigerator, water pump, motor for grinder, line shaft and grain elevator.

Ralph Hickey, Gretna.—3,400 kw-hr. Lights, household appliances, refrigerator, range, motor on water pump.

H. W. Cockerill, Richfield.—25,500 kw-hr. Refrigerator, range, motors on two wells, grinder, motor on elevator.

Howard J. Luther, Nickerson.—8,000 kw-hr. Lights, appliances, stove, refrigerator, pump, 10-h.p. motor on grinder.

Geo. Cockerill, South of Gretna.—7,000 kw-hr. Lights, household appliances, refrigerator, cream separator, oil burner, ironing machine, water system, motor on pump.

Nevada

Dangberg Land & Livestock Co., Minden, Douglas County. —6,137 kw-hr. Range, water heater.

John Dangberg, Minden.—8,204 kw-hr. Range, water heater.

H. R. Jepsen, Minden.—3,995 kw-hr. Range, water heater.

Valley Farm, Minden.—4,179 kw-hr. Range, motor.

New Hampshire

E. W. Rollins, Rollinsford.—9,908 kw-hr. Motors, milking machine, water pump, refrigerator, many small motors, large lighting load.

Fred A. and James A. Dodge Farm, Rollinsford.—3,547 kw-hr. Water pump, milking machine, cream separator, iron, vacuum cleaner, washing machine, bottle washer, grindstone, lights.

Clifton Hayes, 6th St., Dover.—3,263 kw-hr. Brooder heaters, grain mixer, water pump, washing machine, iron, heater, toaster, vacuum cleaner, lights.

Sumner D. Sterling, 6th St., Dover.—7,054 kw-hr. Water pump, milk refrigerator, grindstone, milking machine, range, mangular motors, iron, vacuum cleaner.

Strafford County Farm, Dover.—9,908 kw-hr. 2 water pumps, laundry motor, bread mixer, meat chopper, butter churn, exhaust fan, cream separator, 3 electric irons, vacuum cleaner.

New Jersey

Little Flower Monastery, Newton.—Over 2,000 kw-hr. Pumps, 2 refrigerators, general farming and dairying, lights.

Samuel Montrose, Vernon.—Over 3,000 kw-hr. Washer, refrigerator, brine pump, water pump, milking machine, lights, iron, vacuum cleaner.

Ralph Williams, Hamburg.—Over 3,000 kw-hr. Washer, milker, lights, vacuum cleaner, 2 irons.

Jake L. Pittinger, Jerseyville Road, Howell.—5,143 kw-hr. 3 motors, milking machine, dairy refrigerator, house refrigerator, furnace stoker, water pump, iron, washing machine, lights.

Irving Owens, Bradvelt Rd., Holmdel.—3,431 kw-hr. Poultry farm, no list of appliances.

J. H. Becker, Freehold Rd., Morganville.—3,666 kw-hr. Truck farm, no list of appliances.

T. McCampbell, Red Bank Rd., Holmdel.—3,881 kw-hr. Truck farm, no list of appliances.

H. C. Scudder, Trenton Junction Road, Trenton.—11,616 kw-hr. Pump, bottle washer, filler, refrigerator, separator, pump, lights.

T. B. Boss, Route No. 4, Trenton.—5,723 kw-hr. Lights, milking machine, pump.

Thomas Harvey, Atlantic Ave., Columbus.—6,024 kw-hr. Lights, water pump, refrigerator, cutter.

John V. Bishop, Columbus Road, Columbus.—34,395 kw-hr. Lights, milking machine, pump, compressor for ice machine, corn cutter and general utility.

Wood Brook Farms, Plainfield Ave., Metuchen.—12,754 kw-hr. Lights, ice crusher, bottle washer, can washer, separator, saw, elevator, pasturizers, bottle filler, bottle conveyor.

Lester Collins, Union and Collings Lane, Pensauken.—36,278 kw-hr. Lights, refrigerator, 2 pumps.

Matthew Suydam, Franklin Park Road, New Brunswick.—7,761 kw-hr. Lights, refrigerator, pump, ice machine, portable motor.

Howard F. DeCou, Kings Highway and Church Road, Colestown.—3,519 kw-hr. Lights, pump, fruit sorter, fruit polisher, water pump, irrigation pump.

New Mexico

New York

Park & Pollard Co., Inc., Batavia.—6,907 kw-hr. Lights, pumps, 2 motors, refrigerator, milking machine, washing machine, separator.

Warren Hawley, Batavia.—4,197 kw-hr. Lights for house and barn, incubator, pump.

Arthur E. Minor, Batavia.—3,049 kw-hr. Lights in house and barn, 2 motors, range, refrigerator.

N. C. Shiverick, Avon.—14,035 kw-hr. Lights in house and yard, range, 2 motors on pumps, furnace motor, air pump motor.

J. W. Wadsworth, Jr., Groveland.—10,724 kw-hr. Lights in barns, owner's house and 2 tenant houses, range, motor on carrier, refrigerator, feed grinder.

Markham & Puffer, Avon.—21,561 kw-hr. 3 motors, air pressure motor, 2 motors in dairy barn, refrigerator, washing machine, lights, mangle, fan, motor on pump.

Jerry Wadsworth, Geneseo.—10,025 kw-hr. Refrigerator, range, water pump, milking machine; house, stable and grounds lights.

James J. Wadsworth, Geneseo.—3,583 kw-hr. Feed grinder, refrigerator, water pump, lights in house and stable.

Herbert Wadsworth, Avon.—7,904 kw-hr. Saw mill, feed grinder, lights in house, stable and grounds.

C. A. Rogers, Bergen.—5,227 kw-hr. Water pump, incubators, feed grinder, saw and grinder, refrigerator, 700-watt heater, general house and barn yard lights.

Kenyon Warner, Groveland.—3.785 kw-hr. Milking machine, water pump, washing machine, range, lights in house and stable.

Wm. Crandall, West Ave., Kendall.—3,933 kw-hr. Water pump, iron, vacuum cleaner, headlight heater, brooders and incubators, henhouse lights.

H. L. Hill, Knowlesville.—5,813 kw-hr. Steam table, coffee urns, dish washer, irons, fans, washing machine, water pumps, vacuum cleaner, kitchen aid and floor waxer

Clark Allis, Telegraph Rd., Medina.—Over 3,000 kw-hr. Water pumps, washing machine, water heater, exhaust fan, electric steam radiator fans, vacuum cleaner, headlight heater, iron, range, icebox, hotplate, waffle iron, curling iron, sewing machine, soldering iron, heating pad, vibrator, fireless cooker, transformer for doorbell, thermostat, battery charger.

North Carolina

F. D. Castlebury, Raleigh.—9,075 kw-hr. Refrigerator, water pump, lights for home and barns.

North Dakota

Moher and Moher, Devils Lake.—3,628 kw-hr. 3-h.p. motor, miscellaneous household appliances.

Ohio

P. Paumier, Chapel St. Extension, Louisville.—7,500 kw-hr. Water pump, washer, sweeper, iron, radio, brine circulating pumps, pasteurizing machine, bottling machine, bottle washer, water pump, milking machine, refrigeration plant, clipping machine, ventilating fan, lights in house and all outbuildings.

M. B. Shellabarger, Route No. 16, Dayton.—4,856 kw-hr. Refrigerator, brine pump, deep well pump, concrete mixer, line shaft, milking machine, washing machine, bottle washer, household appliances.

A. E. Wildman, Route No. 1, Selma.—3,611 kw-hr. 10 h.p. on ensilage cutter and blower, 10 h.p. on feed grinder, 3 h.p. on pumps and various household appliances.

Herbert Markey, Route No. 13, Dayton.—7,596 kw-hr. Water heater, range, motors on pumps, milking machine and small household appliances.

Donald D. Curtis, Route No. 13, Dayton.—4,366 kw-hr. Incubator, ventilating fan, ice machine, motor on pump, household appliances.

C. E. Loker, Route No. 2, Germantown.—4,628 kw-hr. Motor on feed grinder, ensilage cutter, elevator, 5 h.p. on corn sheller and sacker, range, motors on pumps.

Oklahoma

S. A. Marshall, Route No. 9, Oklahoma City.—9,000 kw-hr. Refrigerator, water pump, milking machine, range, various household appliances.

T. M. Townsend, Route No. 9, Oklahoma City.—3,000 kw-hr. Range, brooders, household appliances. (Is adding feed grinder and refrigerator.)

Harry Naylor, Route No. 10, Box 363, Oklahoma City.—12,000 kw-hr. Milking machine, pump, separator, cooler, range.

John Welter, General Delivery, El Reno.—3,600 kw-hr.

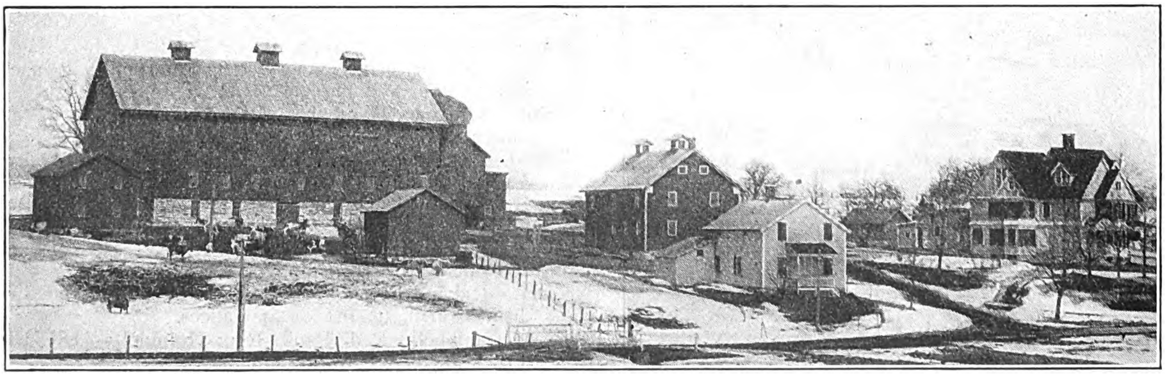

FIG. 16—THIS NEW YORK STATE FARM USES AN ELECTRIC REFRIGERATOR, RANGE, WASHER, BATTERY CHARGER AND FLATIRON.

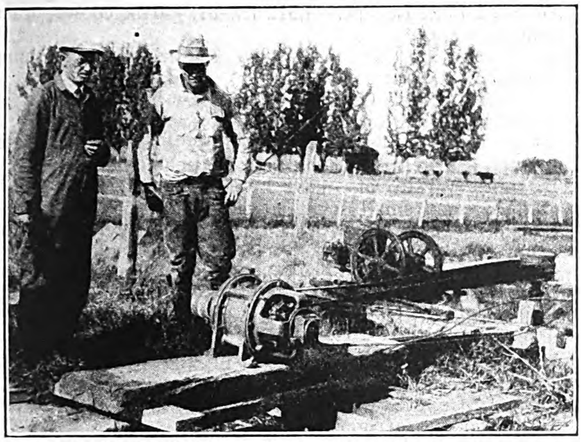

FIG. 17—SUPPLEMENTARY IRRIGATION WATER SUPPLY IN OREGON—THE MOTOR REQUIRES NO WATCHING.

Pumps, feed grinders, house refrigerator, range, household appliances.

J. C. Bostick, Ardmore.—6,000 kw-hr. Refrigerator, pump, milking machine, feed grinder, silo filler.

W. H. Hedges, Ardmore.—3,000 kw-hr. Milking machines, water pumps (is adding 5-h.p. motor for filling silos and grinding feed, also a range, and large refrigerator for milk cooling purposes).

Motor Woods, Ardmore.—3,000 kw-hr. Refrigerator, milking machine, water pump.

Ed Hoar, Carrier.—3,000 kw-hr. Range, refrigerator, various household appliances.

Oregon

Iron Hill Orchard, Inc., Route No. 3,—Salem.—5,978 kw-hr. 3-h.p. motor on pump, 5-h.p. general utility motor for general farm work, various household equipment.

John J. Roberts, Route No. 3, Salem.—26,459 kw-hr. Hop ranch using service in 3 ranch houses, small motor for pumping, utility motor for cutting feed, 7 15-h.p. motors for fans during hop drying season.

F. W. Durbin & Son, Route No. 6, Salem.—39,736 kw-hr. Lights in home, dairy barn, outbuildings; milking machines, refrigeration plant, pump motor, motor for feed grinding, motor for hay hoist, and usual farm equipment.

Brophy Hop Ranch, Route No. 2, Salem.—3,992 kw-hr. 15-h.p. motor driving centrifugal pump used for irrigation.

P. Corpstein, Route No. 2, Turner.—3,195 kw-hr. Lights, water pump, 7½-h.p. motor on circulation fan during prune drying season.

T. A. Livesley Co., Route No. 8, Salem.—26,136 kw hr. Lights in house, ranch buildings, 1 50-h.p. and 2 25-h.p. motors on pumps for irrigation.

Lloyd A. Lee, Route No. 6, Salem.—19,903 kw-hr. Hatches chickens. Service in house as well as operating incubators, brooders, small pump motors.

A. L. Lindbeck, Route No. 6, Salem.—3,010 kw-hr. Chicken farm. Service in house as well as operating incubators, brooders, small pump motors.

J. M. Nichols, Route No. 6, Salem.—3,938 kw-hr. Dairy farm using electricity in home as well as small motor operating water pump, 2-h.p. motor for feed chopping.

F. H. Richter, Ontario.—3,274 kw-hr. Range, 2 water heater, toaster, iron, washing machine, 1-h.p. water system, refrigerator, 1-h.p. milking machine, 1/6-h.p. bottle washer, ¼-h.p. separator, ¼-h.p. circulating pump.

C. Shelton, McMinnville.—3,173 kw-hr. Lights, heating, small motor, toaster, percolator, washing machine.

J. A. Campbell, Route No. 2, Amity.—4,134 kw-hr. Lights, range, motor.

R. L. Harris, Route No. 1, Sheridan.—4,963 kw-hr. Motor, incubators, electric appliances.

J. E. Panck, Route No. 1, Tigard.—3,901 kw-hr. Lights, range, incubators.

H. A. Dryer, Route No. 1, Tigard.—4,279 kw-hr. Lights, range, motor, milking machine.

Pennsylvania

B. D. Miller, Bethany.—29,222 kw-hr. 8 water pumps, 2 milking machine, 3 2-h.p. motors for creamery use, 1 5-h.p. motor for ice plant, range, lights, appliances for farm home and help's home.

Geo. A. Konkle, Mill Creek Rd., Route No. 2, Montoursville.—5,307 kw-hr. Milking machine, bottle washer, milk aerator, water pump, grain grader, range, washing machine, iron, curling iron, radio.

Allendale Farms, Inc., Route No. 3, Montoursville.—18,474 kw-hr. Ice crushing machine, refrigerator, milking machine, cooling and standardizing machine, milk bottle washer, lights, appliances in home.

Mill Brook Farm, E. M. Archy, Prop., Mill Hall.—4,811 kw-hr. Milking machine, refrigerator, ¼-h.p. motor, lights, appliances.

Robt. Pittinger, Pond Rd., Bethlehem.—3,228 kw-hr. Range, lights and appliances.

Chas. Eichlin, Route No. 2, Perkasie.—3,514 kw-hr. Range, water pump, brooder, lights, washer, cleaner, household appliances.

Chas. H. Price, Jr., Main St., Telford.—3,229 kw-hr. Range, incubator, lighting brooder houses, washer, cleaner, household appliances.

Heston R. Leidy, Souderton.—3,576 kw-hr. Range, water pump, lights in brooder houses, washer, cleaner, household appliances.

H. F. Rittenhouse, Franconia.—3,055 kw-hr. Range, water pump, washer, cleaner and household appliances.

W. F. Rosenberger, Route No. 1, Hatfield.—4,835 kw-hr. Range, refrigerator, water heater, water pump, thresher, washer, cleaner, appliances.

Ray Belle Farm, W. E. Erdell, Prop., Allentown.—3,570 kw-hr. 2 pumps, range, toaster, percolator, iron, 125 lights, ¼-h.p. motor, refrigerator.

Wm. Wenz, Wenz Farms, Breinigsville.—7,232 kw-hr. Feed

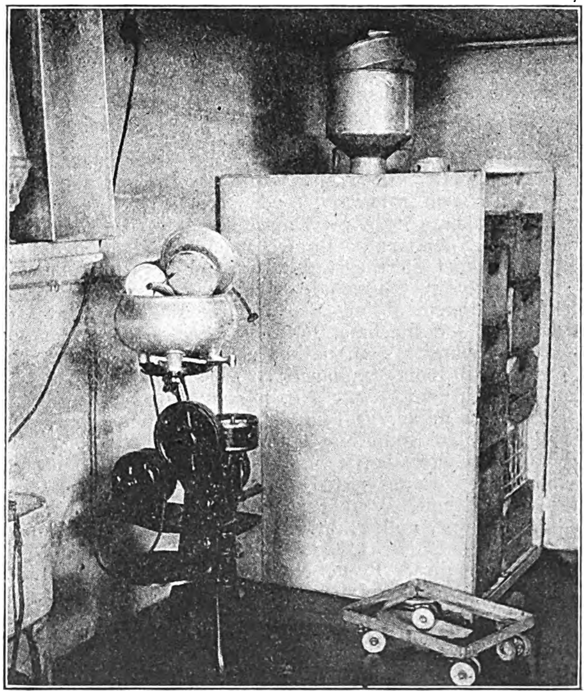

FIG. 18—AN ELECTRIC SEPARATOR IN USE ON AN OREGON FARM.

grinder, milking machine, bottle washer, cream separator, pump, range, refrigerator, milk cooler, washer, iron, toaster, percolator.

V. M. Schmoyer Farm, Minesite near Macungie.—3,041 kw-hr. Range, pump, iron, washer, percolator.

J. W. Silvas & Sons, Route No. 1, Greensburg.—Over 3,000 kw-hr. Milk cooler, bottle washer, bottler, household appliances, water system.

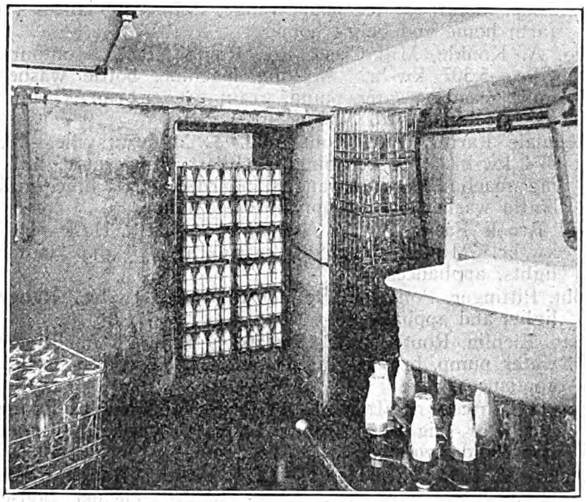

FIG. 19—COOLING 22,000 POUNDS OF MILK PER MONTH ELECTRICALLY ON A PENNSYLVANIA FARM.

H. E. Steel, Route No. 5, Greensburg.—Over 3,000 kw-hr. Milk cooler, bottle washer, bottler, household appliances, water system.

J. W. Patterson, Star Route, Apollo.—Over 3,000 kw-hr. Milk cooler, bottle washer, bottle, household appliances, water system.

W. J. Zimmerman, Leechburg.—Over 3,000 kw-hr. Milk cooler, bottle washer, bottler, household appliances, water system.

Geo. Rutter, Carmichaels.—Over 3,000 kw-hr. Milk cooler, bottle washer, bottler, household appliances, water system.

W. H. Farrar & Sons, Route No. 4, Midway.—Over 3,000 kw-hr. Milk cooler, bottle washer, bottler, household appliances, water system, range.

J. N. Loffert, Route No. 4, McDonald.—Over 3,000 kw-hr. Milk cooler, bottle washer, bottler, household appliances, water system, range.

C. E. Honsaker, City View Dairy, Masontown.—Over 3,000 kw-hr. 5-h.p. motor on ice machine, 3-h.p. motor on washer and sterilizer, 2-h.p. on milker, miscellaneous small motors, household appliances.

Michael Rathgeb, Route No. 3, Greensburg.—Over 3,000 kw-hr. Ice machine, bottle washer, bottle filler and capper, water system, milker, churn, separator, line shaft for small tools, appliances.

Wm. Reifschneider, Route No. 1, Arnold.—Over 3,000 kw-hr. range, milker, full line of household appliances.

Joseph L. Bauer, Route No. 2, Jeannette.—Over 3,000 kw-hr. Milker, cooler, bottle washer, bottler, small household appliances, water system.

Mrs. Jane Elliott, West Brownsville.—Over 3,000 kw-hr. Ice machine, milker, separator, water heater, household appliances.

Frank S. Laughead, Route No. 5, Uniontown.—Over 3,000 kw-hr. Range, refrigerator, milker, household appliances.

S. B. Eckert, Goshenville.—3,376 kw-hr. Lights, pump, refrigerator.

Harry Collins, Rocky Hill.—8,008 kw-hr. Range, refrigerator, milk cooler, water pump.

Mrs. Wm. Boyle, West Chester.—3,246 kw-hr. Water pump, lights.

Helen Reed Fox, Lenape.—4,512 kw-hr. Milk cooler, water pump, lights.

Chas. E. Mather, Lenape.—9,846 kw-hr. Water pump, lights, refrigerator.

Paul Snyder, West Chester.—26,714 kw-hr. 2 motor ice machines, 1 motor general power, water pump.

Margaret Dallett, Westtown.—3,968 kw-hr. Range, water pump, refrigerator, lights and household appliances.

M. L. Jones, Westtown.—4,892 kw-hr. Refrigerator, lights, water pump, small farm power.

H. M. Kelse, Westtown.—3,001 kw-hr. Refrigerator, water pump, lights.

Samuel Horner, Malvern.—4,081 kw-hr. Range, lights, refrigerator.

Wm. I. Mirkil, Malvern.—4,383 kw-hr. Water pump, range, lights.

John F. Lewis, Morstein.—4,037 kw-hr. Water pump, lights, refrigerator.

Wilmer B. Cox, Malvern.—4,306 kw-hr. Range, lights, water pump, refrigerator.

Arthur Pierce, Willistown, Malvern.—9,525 kw-hr. Range, water pump, 2 refrigerators.

A. Merritt Taylor, Sugartown, Malvern.—4,845 kw-hr. Range, water pump, lights, refrigerator, household appliances.

G. Brinton Lucas, Malvern.—3,079 kw-hr. Refrigerator, water pump, lights.

Delchester Farms, Edgemont.—36,025 kw-hr. Milking machine, washer, water pump, bottle washer, sterilizer, separator, ammonia machine, bottle filler, lights in one barn—milking machine, lights and water pump in another barn, clipper motor, blacksmith shop, plainer motor, saw motor and forge motor—9 tenant houses with lights and appliances.

John Hockel, Limerick.—Over 3,000 kw-hr. Range, lights.

C. D. Marshall, Laurel Locks Farm, Pottstown.—15,876 kw-hr. 3 fans, refrigerator, 3 motors for filling silo, milker, thresher, corn husker, pump, creamery.

Dorothy Cadwalader, Charlestown Twp., Route No. 3, Phoenixville.—4,825 kw-hr. Milk cooler, pump, lights.

R. H. R. Toland, Cedar Run Farm, Route No. 2, Phoenixville.—7,246 kw-hr. Milk cooler, pump.

G. W. Heuer, Trooper Rd. Trooper.—6,786 kw-hr. Milk

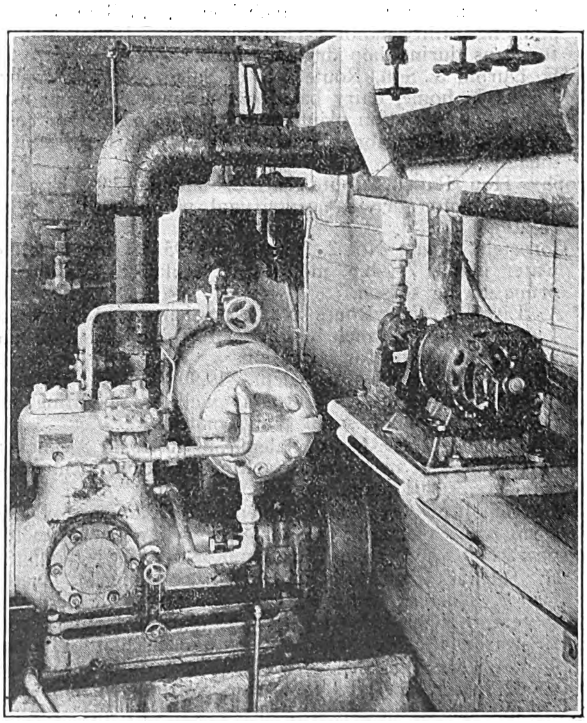

FIG. 20—ELECTRIC DAIRY REFRIGERATOR INSTALLATION ON A FARM IN PENNSYLVANIA.

cooler, refrigerator, 2 pumps, sweeper, washer, iron, radio, lights.

James A. Staley, Ridge Pike, Eaglesville.—5,854 kw-hr. Washer, milk cooler, bottle washer, iron, sweeper, radio.

Daniel Buckley, Skippack, Pike, Broad Axe.—3,941 kw-hr. Range, refrigerator, washer, cleaver, iron, motors, lights.

Thos. Berger, State Rd., Valley Forge.—7,362 kw-hr. Range, refrigerator, washer, ironer, cleaner, iron, pump, milk cooler, lights.

F. H. Hargass, Valley Forge.—4,950 kw-hr. Refrigerator, motors, water pump, washer, iron, cleaner, lights.

I. R. Lindle, Valley Forge.—5,647 kw-hr. Motors, refrigerator, washer, cleaner, iron, lights.

C. B. Wood, River Rd., W. Conshohocken.—12,624 kw-hr. Refrigerator, motors, water pump, lights.

Leo. Angove, Akeley.—5,840 kw-hr. Range, refrigerator, washing machine, iron, mangle, warming pad, battery charger, waffle iron, curling iron, vacuum cleaner, sewing machine, radio, pump, motor oil burner, milking machine, chicken house lights.

J. B. Moore, Garland.—7,895 kw-hr. 2 milking machines, water system, separator, barn lights, 2 residence lightings, ensilage cutter, creamery (power and lights), refrigerator, radio, iron.

Willis Bisbee, Perry Highway, Union City.—3,450 kw-hr. 3½-h.p. motor and gas station.

W. H. Shreve, Meadville Rd., Union City.—7,774 kw-hr. 3½-h.p. motor, milk farm.

L. D. Shreve, Route No. 6, Union City.—3,390 kw-hr. Motors, range, lights.

E. E. Wheeler, Waterford.—3,000 kw-hr. 4-h.p. motor, range, lights.

John Forsythe, Clearfield.—5,472 kw-hr. Lights in 3 barns, range, feed chopper, 2 pumps.

H. H. Tompson, Route No. 56, Sharpsville.—10,175 kw-hr. Refrigerator, bottle washer, water pumps, milking machines, range, lights.

W. H. Crawford, Mercer.—4,319 kw-hr. Lights, milking machine, water pump, small motor.

F. L. Fay, Greenville.—3,982 kw-hr. Lights, range, water pump, refrigerator.

Chas. Koonce, Clarksville.—3,060 kw-hr. Lights, small motor, refrigerator, pumps.

O. C. Neel, Route No. 36, Fredonia.—3,060 kw-hr. Lights, range, pump.

St. Paul's Orphans' Home, Greenville.—15,775 kw-hr. Lights, water pump, ironer, motors.

Dr. Frederick Taylor, Pulaski.—3,751 kw-hr. Range, washer, sweeper, refrigerator, toaster, radio, commercial refrigerator, dairy ventilation, milking machine, 2 water pumps, ensilage cutter.

H. G. Haskell, Cossart.—7,099 kw-hr. Oil burner, cream separator, bottle washer, agitator in pasteurizing tank, lights.

Rhode Island

Geo. W. Madison, Potowomut Rd., East Greenwich.—6,048 kw-hr. Refrigerator, milking machine, small dairy apparatus and pumping machine, household appliances, radio.

P. C. Peterson, Greenville Ave., Johnson.—3,240 kw-hr. Water pump, milking machine, chicken house lights and lights in house and barn.

Wyman Whitman, Hope Ave., Oaklawn.—6,276 kw-hr. Refrigerator, water pump, milking machine, lights, household appliances.

Fred L. Williams, Scituate and Seven Mills Rd., Scituate.—3,720 kw-hr. Water pump, refrigerator, range, appliances, lights for barn.

R. L. Knight, Hope Ave., Oaklawn.—4,068 kw-hr. Milking machine, water pump, household appliances, range.

South Carolina

St. J. A. Lawton, Charleston.—18,192 kw-hr. Lights for home and dairy, 2 household refrigerators, 1 dairy refrigerator, milking machine, water pump for livestock and dairy.

Coburg's Dairy, Charleston.—19,836 kw-hr. Lights for home, signboard and dairy, refrigerator for dairy, water pump for home and dairy, milking machines, bottle washer, separator, churn, ensilage cutter, wood saw.

H. F. Barkerding, Charleston.—23,370 kw-hr. Lights for house and dairy, refrigerator for dairy, water pump for home and dairy, milk cooler.

T. M. Whittemore, Charleston.—6,774 kw-hr. Lights for house, and poultry house, 2 refrigerators for home, water pump for home and livestock, range.

South Dakota

Ernest Johnson, Sioux Falls.—4,414 kw-hr. Milking machine, refrigerator, feed grinder.

C. W. Thompson (Woodlawn Dairy), Sioux Falls.—11,158 kw-hr. 2 milking machines, feed grinder, silo filler.

B. E. Cornue, Sioux Falls.—4,886 kw-hr. Milking machine, refrigerator, range, water pressure system.

Geo. L. Renner, Sioux Falls.—4,638 kw-hr. Refrigerator, range.

F. I. Renner, Sioux Falls.—3,541 kw-hr. Range, milking machine.

John Parker, Sioux Falls.—3,151 kw-hr. Milking machine.

O. Benson, Sioux Falls.—3,352 kw-hr. Milking machine, pumps.

Tennessee

R. L. Peters, Farragut.—12,900 kw-hr. Lights, range, milking machine, milk cooler, water pump.

J. Q. Shephard, Cleveland Pike, Chattanooga.—8,156 kw-hr. Lights, range, refrigerator, water pump, feed cutter, milking machine, (is installing complete refrigeration plant for dairy).

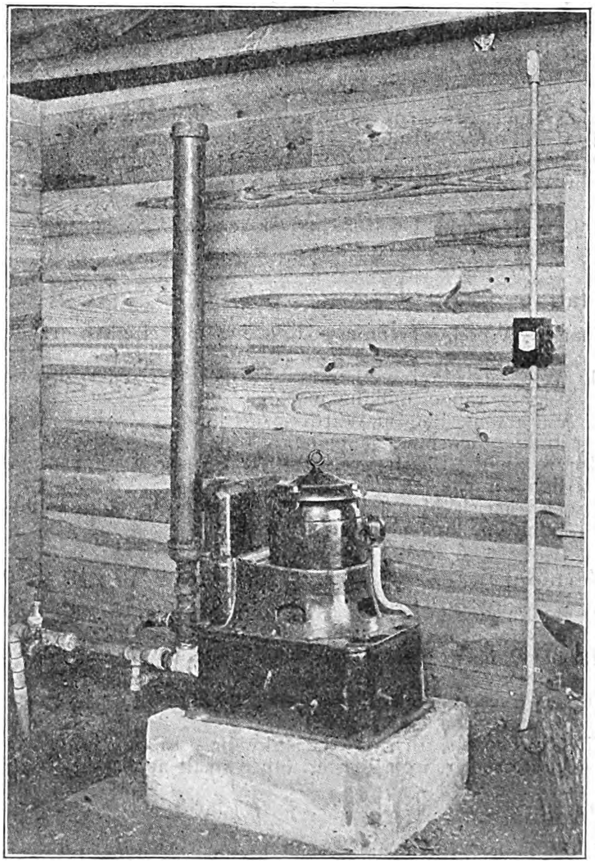

FIG. 21—DEEP WELL ELECTRIC PUMP ON DAIRY FARM IN TEXAS.

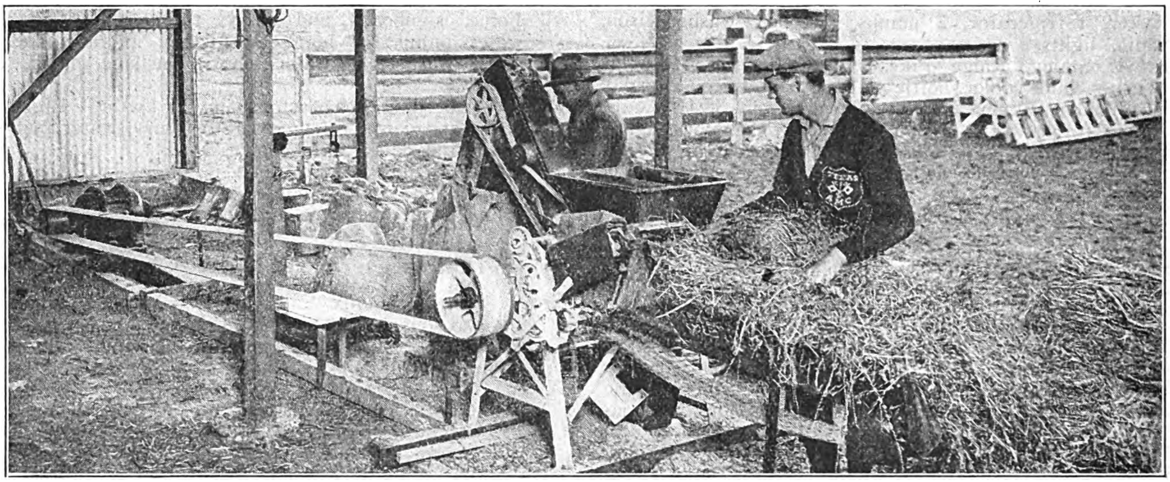

FIG. 22—ELECTRICITY ASSISTS TEXAS FARMERS IN ELIMINATING WASTE IN THE PREPARATION OF ALFALFA FOR DAIRY FEEDING.

Garnett Andrews, LaFayette Rd., Chattanooga.—53,410 kw-hr. Lights, range, water heater, refrigerator, water pump, milking machine, feed cutter, dairy refrigerator.

J. Walter Cummings, Wauhautchie.—45,058 kw-hr. Lights, range, dairy refrigerator, milking machine, water pump, feed cutter, line shaft driving miscellaneous equipment.

Edgar L. Brinkley, Signal Mountain.—4,240 kw-hr. Lights, range, refrigerator, water pump, spray pump.

Texas

C. J. Davis, Corsicana.—5,436 kw-hr. Cotton and stock farm.

C. R. Hoffman, Denton.—5,742 kw-hr. Poultry farm.

F. A. Wisse, Muenster.—4,224 kw-hr. Grain and stock farm.

Louis Duke, Sherman.—4,440 kw-hr. General farm.

H. R. Mctuley, Misquite.—4,284 kw-hr. Cotton farm.

D. A. Bolfing, Waco.—5,800 kw-hr. Truck farm.

John W. McFarlane, Palestine.—Over 3,000 kw-hr. General farm.

J. J. Wainwright, Crystal City.—Over 3,000 kw-hr. General farm.

Utah

Charles Wood, Trenton.—3,679 kw-hr. Lights, range, pump.

H. W. Ballard, Jr., Benson Ward.—Over 3,000 kw-hr. Lights, range, milking machine.

E. A. Parsons, Benson Ward.—3,069 kw-hr. Lights, range, milking machine, pumping.

Morris Smith, Burch Creek.—7,314 kw-hr. Lights, range, lights in chicken coops.

Joseph Parrish, Mountain Green.—Over 3,000 kw-hr. Lights, range, milking machine, pumping.

Vermont

D. B. Parmelee, Bristol.—3,827 kw-hr. Lights, heat motors, iron, toaster, radio, vacuum cleaner.

Harlan Palmer, New Haven.—6,027 kw-hr. Lights, incubators, 6 fans, vacuum cleaner.

Russell Everest, New Haven.—4,622 kw-hr. Lights, range, toaster, iron.

Thorpe Thomas, Bristol.—4,234 kw-hr. Lights, heat, vacuum cleaner, iron, toaster, other small appliances.

Virginia

E. E. Zeller, Richmond.—8,930 kw-hr. Motors, refrigerator, milking machines and booster, water pump, grain fan, washing machine, lights, vacuum cleaner, toaster, fan, iron.

J. Scott Parrish, Richmond.—13,339 kw-hr. Water pump, brine pump, 3 refrigerators, separator, lights, range, fans, 3 irons, 2 waffle irons, washer, toaster, cleaner.

W. J. Burlee, Richmond.—9,150 kw-hr. Motor, water pump, hay hoist, curling iron, fan, toaster, waffle iron, cleaner, lights.

J. H. Parker & Sons, Portsmouth.—5,187 kw-hr. 2 motors saw, lights.

B. H. Darden, Norfolk.—29,390 kw-hr. Motor for silo filling, refrigerator, water pump, milking machine, brine pump, bottle washer, milk cooler, lights.

Washington

George J. Coulter, Route No. 7, Box 57, Seattle.—4,939 kw-hr. Lights in henhouse 3 hours a day, 2 small motors for cutting straw and hay, brooders, range, water heater, household appliances.

Hollywood Dairy Farm, Woodinville.—63,138 kw-hr.

Peder Halkjar, Enumclaw.—More than 3,000 kw-hr. Milking machine, pump, cream separator, range, household appliances.

F. F. Joubert, Enumclaw.—6,067 kw-hr. 20-acre farm, milks 15 head of cows year round, milking machine, pump, water heater, cream separator, grindstone, washing machine, machinery in shop, 6 motors running farm machinery, range, iron.

West Virginia

A. S. Paull, Wheeling.—4,189 kw-hr. Lights, motors, pumps, mangle, refrigerator.

John B. Garden, Wheeling.—11,330 kw-hr. Lights, motors, deep well pump, cistern pump, water heater, range, refrigerator.

Wisconsin

L. G. Anderson, Rockdale.—3,444 kw-hr. Range, brooders, irons, separator, automatic pumps, cleaners, lights.

George Stillmacher, Route No. 3, Ripon.—3,072 kw-hr. Feed grinder, milker, refrigerator, pump, range, separator, incubator, iron, washer, cleaner, lights.

H. C. Hemmingway, Janesville.—3,492 kw-hr. Range, pumps, milker, separator, bottle washer, battery charger, iron, toaster, cleaner, waffle iron, sewing machine, lights.

Charles Mead, Route No. 4, Ripon.—3,492 kw-hr. Range, pump, iron, water heater, incubator, separator, dishwasher, battery charger, lights.

Martin Hoppert, Route No. 4, Sheboygan.—14,484 kw-hr. Water system refrigerator, bottle washer, G. E. mercury arc rectifier, oil burner, milker, vent fan, toasters, water heaters, separator, ultra violet lamp, washers, brooder, irons, heaters, lights.

George Tabbert, Route No. 3, Ripon.—3,192 kw-hr. Milker, feed grinder, water system, battery charger, water heaters, washer, cleaner, iron, toaster, curling iron, lights.

George L. Hamon, Route No. 3, Juda.—3,492 kw-hr. Range, washer, iron, lights.

J. H. Grenzow, Route No. 3, Juda.—3,476 kw-hr. Range, water heater, water light, iron, washer, lights.

W. J. Dougan, Beloit.—13,368 kw-hr. 7 motors, washer, irons, cooker, cleaner, dishwasher, sewing machine, lights.

W. N. Preston, Route No. 3, Juda.—3,192 kw-hr. Range, water system, hotplate, cleaner, toaster, iron, washer, lights.

David Stevenson, Lodi.—3,024 kw-hr. Pumps, milker, battery charger, separator, washer, cleaner, toaster, curling iron, 2 irons, lights.

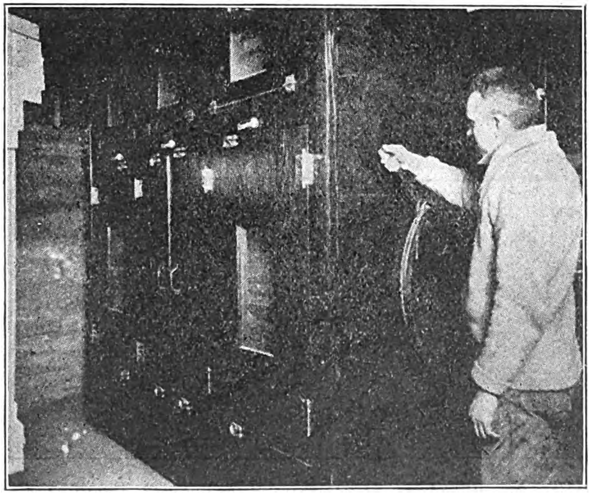

FIG. 30—15,000-EGG ELECTRIC INCUBATOR IN USE ON A WASHINGTON FARM.

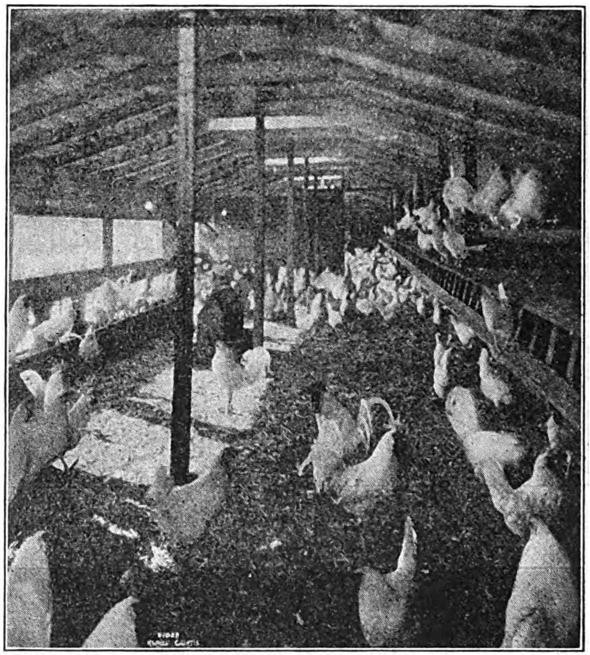

FIG. 31—A WESTERN WASHINGTON POULTRY HOUSE WHERE ELECTRIC LIGHTS INCREASE PRODUCTION 30 PER CENT WHEN EGGS ARE HIGH.

Fred Pabst, south of Oconomowoc Lake.—30,528 kw-hr. Motors for can washer, pumps and miscellaneous dairy farm uses, 2 ranges, lights.

Pleasant Valley Farm, Highway 59, near Genessee Village. —27,782 kw-hr. Motors, range, lights.

Owen Rowlands, N. S. Rd. ¼ mile west of Bethesda Station.—45,680 kw-hr. Motors, range, lights.

Pleasant View Farm, Genessee Village.—24,199 kw-hr. Motor, butter washer, ice machine, lights.

D. W. Norris Farm, Orchardview, Mukwonago.—4,787 kw-hr.

D. W. Norris Farm, Evergreen Farm, Mukwonago.—7,229 kw-hr. Motors for pumps, line shaft, saw, ice machine, dryer, miscellaneous motors, range and lights.

D. S. Williams, Bethesda Station, Route No. 9, Waukesha. —75,520 kw-hr. Motor for silo filler and feed grinder, 35-h.p. of miscellaneous motors, as milking machines, ice machine, air compressor and bottling equipment, range, lights.

Brookhill Farm, on Genessee Road one mile east of Brookhill.—61,800 kw-hr. Motors for milking machines, ice machine, ice crusher, pumps, bottle washer, bottler and filler, box conveyors, blower, elevator, washer, separators and line shaft in shop, range, lights.

Wyoming

COUNTING THE FARMS SERVED

Some six years ago, the electric light and power industry, in cooperation with other agencies, for the first time began giving the problem of applying electricity to agriculture serious consideration. During this six-year period not only have many new and practical uses for electricity on the farm been developed, but company lines have been extended to more additional farm customers than during all previous history combined. In fact the increase is between 150 and 200 per cent.

This record might be taken as something of which to be proud, something that would merit the approval of an interested public, especially when it is taken into consideration that many of the difficulties of electrifying the farm have been dissipated and it looks today as if even more rapid progress can be maintained in the future. Due, however, to negligence on the part of electric light and power companies in maintaining records pertaining to rural service, it is likely, to say the least, that the industry is not receiving the recognition which this development merits.

Companies have nearly trebled the number of farm customers served and put electricity to work performing a multiplicity of agricultural jobs but the figures with which to tell the story are woefully inadequate. In other words, the industry has accomplished a meritorious development, but through failure on the part of individual companies to keep records, few outside the industry know about it.

The Statistical Department at N. E. L. A. headquarters has long endeavored to get member companies to report essential facts regarding farm service. The Association's statistical sheet asks the member companies to supply number of farms served, kilowatt hours consumed, and revenue received, but only a few of the companies are making this return to headquarters. If the figures received at headquarters were taken as an accurate reflection of the number of farms served in the United States a sorry looking record indeed would be presented.

When this information first was asked for many companies made inquiry as to just what constitutes a farm and N. E. L. A. headquarters supplied them with the definition of a farm as used by the Bureau of the Census, reading in condensed form as follows:

> A farm is any place of three or more acres to produce agricultural products; or any place three acres or less where the yearly revenue from agricultural products is more than $250; or any place three acres or less where the owner or tenant devotes his entire time to agriculture.

Even this, however, failed to produce satisfactory results. There is one state which has some 20,000 or 30,000 farm customers, but which shows on the statistical returns as having something like a thousand, all due to companies failing to make this report.

The Accounting National Section is doing all in its power to get accounting departments of member companies to segregate farm business on their books so that the data desired will be continuously available, but there are still many companies which are not supplying this information. It is particularly desirable to obtain accurate record of the number of farms served.

In November, 1928, the Chairman of the Rural Electric Service Committee asked the Chairmen of the Rural Committees of each Geographic Division to supply a count of farms served in each respective division. Returns have been received and are presented here from all states heard from—a total of 31 states. These 31 states show a grand total of 383,730. This is fairly accurate, as the figures from many states represent an actual count, and where the figures are based on an estimate these estimates were made only after a careful investigation. It is significant that the number of farms reported to N. E. L. A. headquarters by these states is only a minor fraction of the number reported by the Chairmen of Geographic Rural Committees. Here is the tabulation:

NUMBER OF FARMS SERVED BY ELECTRIC LIGHT AND POWER COMPANIES

Alabama	6,550
Arizona	900
Arkansas	*
California	62,720
Colorado	3,872
Connecticut	*
Delaware	*
Florida	*
Georgia	*
Idaho	7,216
Illinois	13,284
Indiana	15,163
Iowa	13,817
Kansas	2,830
Kentucky	7,000
Louisiana	*
Maine	11,878
Maryland	*
Massachusetts	*
Michigan	12,500
Minnesota	10,500
Mississippi	*
Missouri	3,760
Montana	663
Nebraska	2,067
Nevada	1,200
New Hampshire	*
New Jersey	11,800
New Mexico	225
New York	47,800
North Carolina	*
North Dakota	1,000
Ohio	30,575
Oklahoma	*
Oregon	11,428
Pennsylvania	27,105
Rhode Island	*
South Carolina	*
South Dakota	2,500
Tennessee	*
Texas	*
Utah	10,114
Vermont	*
Virginia	5,000
Washington	34,443
West Virginia	4,525
Wisconsin	20,885
Wyoming	410
Total	383,730

*No report.

The above tabulation is indicative of a splendid development during these last six years. At the time this work first was seriously undertaken there probably were fewer than 200,000 farms receiving this service. In the above table, which may fairly be dated as of Dec. 31, 1928, 31 states show 383,730 The Rural Electric Service Committee wishes to be conservative in its figures. In attempting to estimate the total for the 48 states, the Committee takes into consideration that many of the states which have the most farm customers are included in the above total. The 17 missing states constitute more than one-third of the 48 states, and if the number of farms served in these 17 states kept pace with the other 31, the grand total would be close to 600,000, but the Rural Committee is willing to be conservative and content with estimating that the total number served is well in excess of 500,000.

These incomplete returns are published here for several reasons:

1. To show the general public, which has been interested in this pioneer field from the very start of the investigations, that some real progress is being made.
2. To bring forcibly to the attention of the Chairmen of the Geographic Divisions who have failed to obtain a count, the necessity for obtaining such figures.
3. To bring the attention of member companies to the importance of filling out the farm information called for in the N. E. L. A. Statistical Sheets.
4. To show manufacturers of electric and farm equipment, as well as electric light and power companies, what kind of a market is developing for their products and where that market is.

It is the hope of the Rural Committee that before another year has passed the electric industry will have put itself in a position to have readily available at all times accurate information in regard to the farm business just as it has now accurate figures pertaining to residence, commercial power, and other phases of the electric business.

DEVELOPMENT OF CUSTOMERS' ACCOUNTING MACHINES

This Serial Report of the Customers' Records Committee, Accounting National Section, has been prepared in response to a demand for information from member companies which are planning to install mechanical accounting appliances, or to extend their systems of mechanical accounting. It is based on 41 replies to a questionnaire sent to 87 leading manufacturers of such equipment.

This report is confined to a description of the machines on which information was received. No attempt has been made to pass judgment on the merits of individual machines.

The Committee acknowledges its indebtedness to Eldon E. Taylor of The New York Edison Company, Chairman of the Mechanical Accounting Machine Appliance Committee, Metropolitan New York Section, under whose direction this report was prepared.

Introduction

At the meeting of the Customers' Records Committee, 1927-28, held in Chicago early in the fall of 1927, there was considerable discussion regarding various mechanical devices used by member companies in connection with the keeping of records in accounts receivable departments. Several new applications were described, and general interest seemed centered on this subject. Committeemen representing territories, including medium sized cities, towns and rural communities, expressed a thought that, if the representatives of companies operating in the large cities would report their experiences with the use of various machines, this information would be of great value. They felt that with their large volume of work such offices were usually first to introduce new equipment, and also that nearly all manufacturers of such devices maintained agencies and service departments within these metropolitan districts, thereby providing a better opportunity of obtaining or observing the latest improvements.

General

Were it not for the application of machinery to the handling of the enormous amount of clerical work involved in the operating of a large accounting department, a much greater number of employees would be required to produce equal results in the same time, much greater working space would be needed, and operating costs so increased that rates to the consumer would necessarily have to be higher.

The development and application within the past few years of mechanical devices used in connection with public utility office accounting has opened a field of almost unlimited scope for study, yet very little has been offered, excepting perhaps on billing and bookkeeping machines, in the way of detailed reports describing the various kinds of equipment. It seemed best that the purpose of this Committee should be to cover thoroughly the description, operation and usefulness of as many kinds of mechanical accounting devices as possible, even if some of these machines were used for purposes that only contribute in an incidental way to the general system of keeping customers or accounts receivable records. Therefore, it was first thought that for this year's work it would be advisable for the Committee to confine its reports to practical operating experiences and not go too deeply into investigations concerning new or untried equipment.

To carry out this plan a letter was sent to all Members-at-Large and Geographic Representatives requesting that they in turn write to the various companies in their districts requesting data on the different machines now in use, and detail of any special or unusual equipment or uncommon application of standard machines. The response was fair, but only three companies submitted sufficient descriptive detail, the remainder merely furnishing lists of the machines owned.

A questionnaire was also sent to all known manufacturers of mechanical accounting devices of generally conceded importance, some 87 in number. Forty-one replies were received, of which 36 were for publication. The information therein contained forms the basis of this report.

Recommendations

The present Committee feels that there is a decided need for accurate, up-to-date information on mechanical accounting methods and, therefore, recommends that its work be continued in future years.

REPORTS

Classification

For convenience the general subject for this year's work has been subdivided as follows:

1. Adding and calculating machines.
2. Addressing machines
3. Autographic registers and duplicating machines
4. Billing and bookkeeping machines
5. Cashiers' equipment
6. Mail room equipment
7. Tabulating machines
8. Miscellaneous.

(Excerpts in quotation marks, others composed from data supplied.)

Publication No. 289-74, Serial Report, Customers' Records Committee.

I—Adding and Calculating Machines

The Barrett

LANSTON MONOTYPE MACHINE CO., TWENTY-FOURTH AT LOCUST, PHILADELPHIA, PA.

This machine is an adding, listing and calculating, key set, crank operated portable outfit, of a base size about 9 x 12 in., featuring visible set-up and printing on narrow ribbons only.

New developments are under way but are not available.

The Corona

PORTABLE ADDING MACHINE CO., 703 E. WASHINGTON ST., SYRACUSE, N. Y.

Portable Model

"This is a seven bank adding machine, compact in design and construction and weighs only 16 lb. It is provided with repeat and error keys, total, sub-total, non-print and non-add keys. It is equipped with an optionally split keyboard, permitting two adding operations to be carried on at the same time, if desired, and has automatic ribbon reverse and a capacity of 99,999.99. The printing sectors are mounted directly on the adding sectors, and the printing is accomplished by the printing press method; that is, the platen is pulled forward to make contact with stationary printing sectors, thus assuring accurate printing of any item entered in the machine.

Office Model

"An office model of the Corona Adding Machine is about to be put on the market. This model has nine banks of keys, but accumulates ten columns in the total, or, in other words, it has a capacity of 99,999,999.99. It is equipped with automatic subtraction feature and with total, sub-total, non-add, repeat and error keys. The general type of construction follows very closely that of the portable model described above. The machine is almost completely inclosed, thus protecting the mechanism from dust and dirt. It weighs 25 lb. and is, therefore, portable for ordinary office use. In neither the portable nor the office model is use made of the dash pot type of governor. The governing principle of Corona Adding Machines is a flywheel and clutch construction, which is used merely to cushion the return stroke of the handle, and has no direct connection with the adding operations.

Accounting Cashier

"The Corona Accounting Cashier consists of a combination of a Corona Adding Machine (the portable model) a cash drawer and a Hanna Register, which provides a complete accounting system for all types of small businesses. With it is furnished an accounting system consisting of ledger sheets, individual customer's accounts, etc. By the use of this accounting cashier and accounting system, a business can exercise a complete control over its operations with a minimum of accounting effort."

Sundstrand

GENERAL OFFICE EQUIPMENT CORP., 342 MADISON AVE., NEW YORK, N. Y.

This company offers a machine of the portable ten numeral key type, one hand touch method control, visible printing, direct subtraction, prints credit balances, automatic placing of numbers in proper position and multiplication shift, gives automatic sub-totals and is manually or electrically operated

Victor

VICTOR ADDING MACHINE CO., 3900 N. ROCKWELL ST., CHICAGO, ILL.

A desk type adding machine using narrow and wide carriages; 6, 8 and 10 column; visible adding dials and printing, direct automatic subtraction printing minus sign (—) on tape, one stroke totals printed in red; sub-total, non-add and repeat keys; and rapid handle action manually operated.

Comptometer

FELT & TARRANT MANUFACTURING CO., 1713-35 N. PAULINA ST., CHICAGO, ILL.

This is a non-listing, portable, full keyboard adding and calculating machine, so constructed that it will add, multiply or divide in more than one column at the same time, thereby allowing the depression of any number of keys simultaneously. The full depression of a key registers the amount of the figure indicated. An automatic safeguard prevents partially depressed or incompleted upstroke and accidental touching of adjacent keys from registering wrong amounts by locking until the correction is made.

Mercedes

RALPH C. COXHEAD CORP., WOOLWORTH BUILDING, NEW YORK, N. Y.

The Mercedes Calculating Machine is used for multiplication and division work. It is an automatic, electrically operated machine, and in order to get a result of a multiplication or a division, it is merely necessary for the operator to insert the proper factors. The motor starts and stops with each problem automatically. While the machine is working out one problem, the next multiplier can be set so that the instant the first answer is given the machine can be started for the next. While dividing, the quotient can be written down as the figures are produced, as the operator's hands are free from manipulation of the machine. These features allow the machine to be kept in continuous operation.

The Mercedes is used for statistical work, such as prorating, percentages and cost work. For example, in prorating, the results are given exactly to the penny, so that it is unnecessary to force a balance. Sub-totals and totals may be obtained immediately without mental effort.

There are a variety of models ranging from the very small Melitta model to one known as the Duo-Special, which consists of two machines operating in unison and capable of solving ten calculations simultaneously.

Record

DOTY BUSINESS MACHINES CO., 912 BUENA PARK TERRACE, CHICAGO, ILL.

This is a calculating machine with flexible keyboard and a semi-automatic sliding carriage carrying two sets of accumulator dials. It is of a high speed type either manually or electrically operated and uses non-metallic gears to reduce the noise. The speed is controlled by adjusting a screw, and a universal motor is used. A special set of nine keys govern the motor control for multiplication or division. Division may be performed by either "building up" subtraction or by throwing in "automatic division latch," which method reduces the mental action of the operator to almost zero.

Rapid

THE RAPID CALCULATOR CO., AMERICAN AND CAYUGA STS., PHILADELPHIA, PA.

This is a compact, portable, lever set calculator weighing about 12 lb. It is operated by a two way crank turned forward for addition and multiplication and backward for subtraction and division.

United Listing, Multiplier and Calculator

UNITED ACCOUNTING MACHINES, INC., 716-28 SIDNEY ST., ST. LOUIS, MO.

This is strictly a calculating machine, which prints the entire problem and result on a straight line, taking but a single operation to make a calculation. Several improvements have been added recently. The machine is especially designed for rapid multiplication. After setting the two factors on the keyboard, a single depression of the motor bar will cause the machine to compute the product automatically and to print both factors and result in a single line, accumulating the totals of the product allowing subtotals to be taken at any point or non-added items to be inserted and printed. Division can be performed as rapidly as multiplication by using the reciprocal method. Direct subtraction is controlled by a key. The cycle of operation requires from two and one-half to three seconds.

This machine readily adapts itself for payroll, cost accounting, inventory, pro-rations and distribution work where percentages are to be determined of a total.

Monroe

MONROE CALCULATING MACHINE CO., INC., ORANGE, N. J.

"The Monroe Adding-Calculator is a non-listing machine.

"Among the recent improvements and developments in Monroe Adding-Calculators is the new standard model, which has been termed the Series "3." It is manufactured in two sizes—8 x 8 x 16 and 10 x 10 x 20, and is equipped with the new automatic start-and-stop motor on electrically operated models.

"Besides the features of the Series '1' and '2' Monroes, there are the distinctive features given below:

> *Left-Hand Upper Dial*—An upper dial which registers in black and red figures (as Series "1" models).
>
> *Right-Hand Upper Dial*—An upper dial which registers in black figures and contains a tens-carry mechanism as Series "2" models).
>
> *Operation*—Both upper dials operate simultaneously, registering either in the same direction or in opposite (complementary) directions.
>
> *Clearance*—Both upper dials may be cleared simultaneously, or left-hand dial only may be cleared. Clearance is accomplished by the regular one-hand clear-out crank, a small lever, convenient to the crank, controls the clearance of the left-hand dial ("on" position) or both dials ("off" position).
>
> *Usefulness of Dials*—In the extension of invoices the various prices may be set on the keyboard and multiplied by the number of items. After each multiplication, the left-hand upper dial only is cleared, allowing the total items to accumulate in the right-hand upper dial, while the total amount accumulates in the lower dial.
>
> In figuring percentages that two items are of the total, one is divided by the total, and its per cent appears in the left-hand upper dial while the complement, or the percentage for the other item, appears in the right-hand upper dial.
>
> An outstanding feature of this model is that it adds, subtracts, multiplies or divides without requiring the setting or changing of levers. The levers, however, permit the machine to handle involved calculations in a simple manner with a minimum number of operations.

"Besides the Series '3,' the Full Automatic Monroe has been developed recently:

> *Model KAA*—This is the latest development in "one-hand" operation without sacrificing the features of flexibility and simplicity.
>
> *Automatic Multiplier Keys*—These are built into the machine on the extreme left of the keyboard. In this logical position there is no possibility of interference with the use of the keyboard, plus (+) and minus (—) bars, etc.
>
> *Automatic Multiplication*—When an amount is set on the keyboard, a mere touch of the proper multiplier key causes the machine to operate the required number of times. On completion of the last revolution, the multiplier key restores to normal position, whereupon the carriage automatically shifts into the next column position. Meanwhile the finger is placed on the next multiplier key to be employed, and as soon as the carriage shifts, the key depresses by the touch of the finger, the process of multiplication continuing without the slightest interruption. Thus the speed is just as rapid as if the entire multiplier were all set up at one time. The upper dials give visible proof of accuracy. When the zero key in the multiplier row is depressed, the carriage automatically shifts one column to the right.
>
> *Full Automatic Division*—With the dividend in the lower dials and the divisor on the keyboard, the operator merely pushes the division control key into the upper position, and the machine, with lightning speed, automatically performs the entire division without any further effort on the part of the operator.

"If the multiplying keys are deemed unnecessary, for the particular type of work for which the machine is purchased, it is possible to take advantage of the new KAS models which function the same as the regular Monroes, but with the added advantage of having automatic division."

II—Addressing Machines

Addressograph

ADDRESSOGRAPH CO., 901 W. VAN BUREN ST., CHICAGO, ILL.

The addressograph is perhaps well known by all companies, and detail of its construction, purpose and operation seems uncalled for in this report. However, the following excerpts from the maker's report may be of interest

"While the first plates that were used were one-piece plates, more complex accounting methods gradually led to the development of sectional plates, which makes possible embossing the name, for instance, on a section by itself, the address on another section, the folio or account number on a third, etc. When a subscriber moves, the name section is removed from the plate, and the name of the new tenant at that address is substituted. In the same way account numbers can be changed without disturbing the other data on the plate.

"Postal card bills can be handled as readily as any other type.

"Daters on the Addressograph printing to the right of the name and address insert the meter reading dates, discount dates, etc.

"Besides the regular impression from the subscriber's plate, these bills are printed with dates—in two colors if desired—in a position entirely remote from the main imprint of the Addressograph. This is done with what is termed as auxiliary printing attachments that can be supplied on the automatic models of the public utility Addressographs.

"Another use public utilities, banks and many other corporations make use of Addressograph equipment is the imprinting of their dividend checks. Dividend models of the Addressograph will imprint the name, address, amount, serial number, dividend number, date and even the signature—in three colors at a single operation. Two color ribbons can be used to print the amount in red and the balance of the check in black. The signature attachment prints direct from ink—of any color.

"Various other imprints can be made on public utility bills, checks, etc.; for instance, a numbering attachment can be supplied to print one number on the entire bill or to print the same number of each of several stubs.

"Addressograph 'short-cuts' are not dependent on the size of a public utility. There is an equipment for every size corporation—for the little one that has but 50 monthly bills, to the large corporation which must run a million bills in triplicate every month. Thirty-five different styles of address plates furnish a suitable address plate for every requirement."

III—Autographic Registers and Duplicating Machines

The Derby

THE DERBY LETTER MACHINE CO., INC., FLATIRON BUILDING, NEW YORK CITY.

"*Model* 750—This machine writes form letters in imitation of typewriting, using a metal stencil, or address plate, 'fills-in' the name, address and salutation at the same time it types the body of the letter—through the same ribbon, in one operation.

"Two operators, one feeding the paper and the other changing the stencils, can write over 750 filled-in letters an hour.

"Using same stencils which fill in the letters, same machine addresses envelopes, or any mailing piece up to 17 in. long, 10¾ in. wide and ⅛ in. thick.

"These stencils are embossed on a Graphotype and can be used in the Model 750 Derby Letter Machine with or without frames.

"'Body' of the letter can be 'set' in Foundry type, Monotype, Multigraph type, Multigraph Monotype, or Linotype. 'Chase' so constructed as to permit equal shading of all lines in letter—long or short.

"*Model* 1500—This is the same as Model 750, except that it uses six-line Pollard-Alling type of plate for filling-in and addressing, and requires one operator instead of two, the stencil feed being automatic.

"Stencils embossed on Graphotype require no frames or trays, and are kept when in use or idle on a wooden spool, 1800 to the spool.

"Speed of operation: 1500 filled-in letters or addressings an hour.

"*Model* 3000—Same principle as Model 1500. Power-driven. Semi-automatic paper and envelope feed.

"Speed: 3000 filled-in letters or addressings an hour."

IV—Billing and Bookkeeping Machines

Burroughs

BURROUGHS ADDING MACHINE CO., DETROIT, MICH.

"Burroughs Adding Machine Co. has added a number of new models to its line of customers' accounting machines, and has developed a number of new mechanical features. Approximately 100 machines or variations are being manufactured for customers' accounting.

"*Multiple Register Machines*—These new machines are so designed that they will carry from fifteen to twenty totals. These compare with previous machines that were limited to carrying six totals, and thus have a wider range in meeting the requirements of utilities whose billing problems are more complicated. The new machines will not only add and subtract vertically and horizontally, but will also carry long totals.

"One feature of the new machines is a special motor bar that prevents the amount of single line bills from adding in the section reserved for bill totaling. This new motor bar adds to the automatic operation of the machine, and accordingly speeds up the work. Heretofore, when it was desired to obtain a bill total in cases where both gas and electricity were included on the same bill, or when it was desired to add merchandise and arrears to the bill at the time of putting on the current charges, it was necessary to go through the operation of totaling out each single line bill. With the special motor bar this is unnecessary.

"A feature of perhaps even greater importance than the special motor bar is a 'keyboard selection of register' for the new multiple register machines. By means of this feature separate totals may be carried even though the figures are all entered in one vertical column. This applies, for example, in cases where the utility wishes to show the consumption account of electricity, light, power and gas in one vertical column, yet requires separate totals for purposes of proving the charges and obtaining the necessary statistical information. The same is true of charges. Electric charges, gas charges, merchandise charges and previous balances may be entered in the same column of the bill, but carried in separate registers of the machine.

"Another feature is a motor bar lock, the purpose of which is to supply automatic proof of accuracy. At the time of billing, the present reading, the previous reading and the consumption is set up in the keyboard from the meter book. If the consumption does not exactly cancel the difference between the two readings, the machine automatically locks, thus immediately warning the operator that an error has been made. This is an optional feature, possessing marked advantages for some billing plans. Where the long proof of meter readings and consumption is used, machines are not equipped with the locking device.

"Motor bar controls for the new machines have been so designed that it is possible to reverse completely or change the normal operation of the machine at certain points, so as to provide for unusual operations. For example, when the carriage is in a certain position, amounts entered on the keyboard may normally add in a predetermined register, but when a special motor bar is used they may add in another register or not at all.

"It is pointed out that the new multiple register machines, besides assisting in proving charges, also assist in obtaining statistical information, even in instances where it is necessary to carry separate totals for each schedule, or each rate step when rates are of a complicated demand nature. All necessary proof of charges, statistical information by classes of service, and data for rate analysis, frequently can be obtained automatically at the time of billing and ledger posting.

"*Special Machines and Features*—For utilities desiring to keep a more complete ledger than could be obtained automatically with machines previously available, a new model has been developed. This machine provides for showing consumption by steps on the ledger, as well as on the bill. The ledger in this case is a carbon copy of the bill, and the proof sheet is a carbon copy of the ledger. By this means, all automatic features of machine operation have been retained.

"For utilities desiring to show various charges on the bill, such as consumption charges, demand charges, meter rent charges, merchandise, arrears, etc., in a horizontal line, a skip tabulating or column skipping mechanism has been perfected. This eliminates the necessity of tabulating into certain columns that might not happen to be active on a particular bill.

"For utilities having complicated rate structures for their larger power accounts, a type of machine has been developed that will do all the calculating required. This machine will figure the difference between the meter readings, figure out the kw. demand, the demand charges, the various steps, the charges at each step, and the total bill.

"For handling final bills for large concerns, three other new models of machines have been developed.

"For small utilities or branch offices of large utilities, an inexpensive type of machine is now being built in several models or variations. The lowest priced model writes the bill and proof sheet in one operation and posts the ledger at another operation.

"For auditing cash collections and making distribution to the proper ledger controls, a number of new machine features have been perfected. While the work varies considerably with different companies, the new features were designed to increase the automatic operation of machines.

"For handling sales analysis, such as sales by lines of business and sales by units of consumption or groups of consumption, a number of new machines have been built. These new machines were especially made to handle this work when the requirements are of such a detailed nature that the information cannot be obtained as a by-product of the billing operation.

"A special low-priced calculator is now being built for proving work after billing and ledger posting, and also for obtaining statistical data. This calculator was designed to meet the demand for a small machine. It has a capacity of 9,999.99 and weighs under 7 lb.

"Two other developments are a new application of present machines for the handling of customers' accounting ledger controls, and a plan for using one-time sheets of flatfold carbon, or continuous carbon rolls, in connection with billing and posting.

"*Chair*—A chair for machine operators is also among the new developments of the Burroughs company. This chair is constructed to place the operator at the proper position before the machine and at the same time to insure the operator's correct posture from the standpoint of health.

"*Cashier*—In connection with the collection of customers' accounts, many utilities will be interested in the new combination adding machine and cash drawer recently placed on the market by the Burroughs company."

Dalton Accounting Machine

REMINGTON RAND BUSINESS SERVICE, INC., 374 BROADWAY, NEW YORK, N. Y.

"The Dalton Division of this company is carrying on studies and development in this class of machines, and will soon have some to offer, but at the present time (April 3, 1928) no machine is ready for sale."

Elliott-Fisher

GENERAL OFFICE EQUIPMENT CORP., 342 MADISON AVE., NEW YORK, N. Y.

"Elliott-Fisher is a writing, adding, subtracting and cross-computing accounting machine with a flat writing surface. It makes rapid and accurate collation of forms of various sizes and shapes remarkably easy.

"*Writing Machine*—For writing cut forms—card records, requisitions and so forth, regardless of size or thickness. Especially adapted for heavy manifolding. Electrically or manually operated.

"*Automatic Feed*—Developed for writing single or multiple copies in continuous length forms. Either roll, superfold, interfold or fanfold forms may be used. As a completed set of forms is removed from the machine, the next is automatically brought into writing position.

"This machine also is available with a double platen or writing surface, accommodating two or more different sets of forms.

"Suitable for writing connect, disconnect, change of name, or other orders of this nature. Electrically or manually operated.

"*Universal Accounting Machine*—Adds, subtracts, cross-computes and furnishes written mechanical proof of all postings, as well as columnar and cross totals of every column of figures affected by postings.

"Adaptable to merchandise and miscellaneous billing. Electrically or manually operated.

"*Public Service Accounting Machine*—Designed for public utility consumer billing, this machine accommodates both quantity and decimal figures. It automatically subtracts meter readings, giving consumption; adds the charges, subtracts discounts, adds arrears merchandise, and so forth, with mechanical proof of accuracy. At the same time it accumulates columnar totals of readings, consumption, steps, charges, etc. Also it will write the bill—ledger if one is used—abstract or recapitulation in one simultaneous operation, proving the accuracy of each figure.

"This machine is of extreme flexibility, due to unit assembly. It is adaptable to any system and can be easily adjusted to take care of any change in rate or system.

Magazine Feed Public Service Machine—This has the same general characteristics as the foregoing machine, but is developed for writing two forms only—bill either single or in duplicate, and bill register or abstract sheet.

"Bills in cut form are fed to writing position and ejected automatically. The register sheet, either in cut form or in continuous length, is also fed and spaced mechanically.

"The feeding of a bill, ejection of completed bill and spacing of register sheet is accomplished faster than the operator can turn over a page in the meter book.

"All the clerk has to do is write. Due to the fact that unproductive motions are eliminated, this machine has high production possibilities and is adaptable to any modified or ledgerless plan."

Remington

REMINGTON RAND BUSINESS SERVICE, INC., 374 BROADWAY, NEW YORK, N. Y.

"The Remington Front Feed Billings and Bookkeeping Machine has been developed for public utility customers' accounting. Efforts have been made in the designing of this machine to incorporate features essential to secure the best possible results. A brief description of each of these features may serve to illustrate the application of this machine to public utility bookkeeping requirements.

"Visibility—This feature assures accuracy and makes it possible for the operator to know that the various amounts are being written in the proper positions.

"Easy and Rapid Insertion of the Bills—The bills are inserted from the front to end stops which provide automatic and mechanical registration.

"Automatic Spacing of Register Sheets—The register sheets are spaced automatically. As the carriage returns, the sheet is mechanically spaced to the next position.

"Adaptability—Due to the rate structures and other conditions, it is essential that it be possible to adapt a machine to each individual requirement in order to secure the necessary distribution and classification of consumption, revenue and other charges.

"Simplicity of Operation.—Clerks who are familiar with the work may be taught how to operate the machine and eliminate the necessity of depending on trained operators."

Underwood

UNDERWOOD TYPEWRITER CO., 30 VESEY ST., NEW YORK, N. Y.

Principles of Construction of the Underwood and Its Operation

"The operating units of the Underwood Billing and Bookkeeping Machines—the writing section, the adding and subtracting mechanism, the tabulating mechanism, the registers, and different widths of carriages are in-built parts of every machine; however, the machine embodies flexible principles of construction that will permit not only of changing paper-handling devices, but its 'set-up' (the way the machine is set to perform the work) as well. The machine itself is used as a base upon which to build the necessary mechanical devices to facilitate and simplify the work of handling various styles of forms.

"Therefore, regardless of the system in use, the system being contemplated, or how it may be changed after machines are installed, the Underwood can be adapted to fit.

Distinctive Features

"Writing Mechanism—The writing section of the machine is the Underwood Standard Typewriter. The typewriter, however, is an integral part of the machine and not merely an attachment.

"Standard Keyboard—The keyboard is stationary—the first essential of a machine for speed, accuracy and ease of operation.

"ALPHABET KEYS—Essential in heading accounts and for writing other descriptive matter. This feature eliminates the necessity of extra typewriters for this purpose, or doing such work with pen and ink. It insures neat, clear and legible records. (If not required, the alphabet keys may be covered.)

"NUMERAL KEYS—Ten figure keys of the typewriter constitute the numeral keyboard. The same keys are used for writing amounts and numbers of all kinds, such as dates, folio numbers, meter numbers, account numbers, etc.

"TABULAR KEYS—The tabular keys instantly move the carriage to the exact decimal position in any column. Mistakes on the part of the operator are mechanically indicated and instantly detected by the numeral keys automatically locking. The operation of a tabular key serves to lock the carriage in correct decimal position in the column.

"On such work as public utility billing the tabulating mechanism is made to work automatically, also to skip several columns at a time. Therefore, the operation of tabular keys is unnecessary.

"Adding and Subtracting Mechanism—This section is an integral part of the machine. The parts are encased, and are made sufficiently large in size to insure durability and to hold adjustments.

"The adding and subtracting mechanism is operated by motor power (not by finger power) at the time the motor automatically trips. The numeral keys serve only to set up certain conditions in this section, which record figures automatically in the registers when the machine cycles.

"While the machine automatically adds and subtracts, as called for by the 'set-up,' the mechanism may be reversed at will by the use of two control keys at the front of the machine marked 'SUB' and 'CR Key.' This feature permits the operator to correct errors and justify totals while in the midst of his work, not waiting until the end of a run.

"Electrically Operated—The motor is one of the important features of the machine. It performs the bulk of the physical work and allows the operator to devote all his attention to maintaining speed and accuracy.

"Automatic Carriage Return and Line Spacer—The motor not only operates the adding and subtracting mechanism, but also returns the carriage at the end of each line and automatically spaces the paper to the next line of writing. This relieves the operator of all heavy, burdensome work and permits continuous, concentrated effort without fatigue.

"Registers—Visible registers make all totals visible at all times. The numerals on the dials are unusually large and clear and easily read. This feature of visibility is one of the most important, for it insures speed and accuracy.

"Reverse dials may be used in any one or all registers. This feature does away with the necessity of mentally figuring complements. (This refers particularly to a machine in use where the company will not permit differences between meter readings to be shown on the meter reader's sheet, and when the meters turn over.)

"From one to seven registers may be had in an adding and subtracting section, each register having a capacity of 9 wheels—$9,999,999.99 or 999,999,999 whole numbers. From one to six registers may be had with a capacity of 12 wheels in each register—$9,999,999,999.99 or 999,999,999,999 whole numbers.

"In each of the above cases any or all registers may be split to give two or more totals, either in money, whole numbers or mixed.

"An exclusive feature is that any or all registers may be used to give either vertical totals of columns or cross-balances on the line. This feature enables the operator to secure a line audit, or mechanical proof, of work at the time it is done.

"Being capable of computing more than one cross-balance or total on the same line simultaneously is valuable in the case of combination bills, bills on which discount is shown, or in rendering completely machine-calculated bills, as in the case of showing total for service plus merchandise charges and arrears and total net.

"Another outstanding feature is the star key (which prints the symbol of proof) and an elimination key on each register.

"The star key proves the result, in the case of writing meter readings and amounts on electric bills. This feature of localization of errors to a particular bill at the time they are made is a most valuable aid to speed and accuracy in billing.

"The elimination key enables operators to prevent incorrect amounts from recording in the registers. Eliminating errors when they occur saves time. There is an elimination key on each register.

"The Indicator—This automatically operated device indicates to the operator in advance the operation the machine

is about to perform, and the color in which the figures will be printed—black or red.

"Continuous Proof Record—The continuous proof record is a safeguard against errors. It is a proof sheet in a continuous strip that unrolls as the cylinder is spaced, and reproduces the figures that have been entered on bills. It serves as a check on the accuracy and efficiency of the machine operator, furnishes the means for making the rate proof, and may be kept as a permanent record.

"Proof Sheet Attachment—This device handles separate sheets of paper, whereas the 'proof record device' handles a continuous roll.

"The proof sheet remains in the machine and is automatically spaced upon the return of the carriage to a new line. The operation of inserting a bill into the machine, therefore, automatically collates the form to the correct writing line on the proof sheet, without giving any attention to the proof sheet.

"Front Feed Attachment—The front feed attachment enables the operator to insert forms from the front of the cylinder instead of the rear. This speeds the work in many applications of the machine. The attachment also permits the insertion of a sheet or card without interfering with others forms that may be in the machine."

New Developments

"Ribbon-Copy Device—The ribbon-copy attachment consists of a single ribbon carried in front of and parallel to the cylinder moving from and onto stock ribbon spools located above and over the cylinder ends. It may be easily removed or attached to stock machines without altering them in any way.

"This device makes a ribbon-copy instead of a carbon-copy, and can be equipped with 'blind' so that the ribbon will not offset on back of original unit. It also permits typewriting on original and not on duplicate by lifting ribbon above writing line.

"Selective Totals—Another late improvement in the adding and subtracting mechanism permits writing several amounts in the same column on the bill, but automatically segregating these amounts into separate totals in independent registers.

"This feature provides for using narrow bills which fit the standard small-sized window envelope; instead of the customary long horizontal bill." In other words, charges for service, amounts for arrears, both service and merchandise, installments for merchandise, coal adjustment, fixed charges, flat rate charges, etc., may all be written in the same column.

"Adjustable Paper Gage and Cutter—This new feature permits having bills printed on continuous stationery, with as many coupons attached as desired, addressed on the Addressograph. In other words, all bills for one route would be in one continuous strip or roll of paper, which would facilitate handling and keeping them clean. It is necessary to insert only one bill for each route. As a bill is completed it is cut off with the adjustable paper gage and cutter, and the next bill is left in correct writing position automatically.

"This feature offers the quickest method of handling bills, as it eliminates inserting them into the machine, with the exception of the first bill of each route.

"Tabulating Machine Punch—This device may be attached to the back of the Underwood machine, and automatically punches either Powers or Hollerith tabulating machine cards at the time bills are written."

OTHER BILLING AND BOOKKEEPING MACHINES ON THE MARKET

Machine	*Manufacturer*
"Moon-Hopkins'	Burroughs Adding Machine Co., Detroit, Mich.
"National Accounting".	National Cash Register Co., Dayton, Ohio.

V—Cashiers' Equipment

Brandt Automatic Cashiers

BRANDT AUTOMATIC CASHIER CO., WATERTOWN, WIS.

"Brandt Automatic Cashiers (coin changing and coin paying machines) eliminate the necessity for mental computation and physical selection of return change in all money transactions. The machines are provided with keys from one to ninety-nine cents inclusive and, according to the model being used, pay either the exact amount shown on a key or the difference between the amount shown and the tender received.

"A subtracting keyboard model is used at customers' account windows and returns the difference between the amount shown on any key and one dollar or smaller tenders. To handle a transaction where $5 is tendered for a bill of $4.21, the operator presses key 21 and the Brandt pays 79 cents return change. This eliminates mental calculations of return change, insures accuracy and speeds up customer service.

"A payroll model pays the exact amount shown on any key, directly into the pay envelope. Key 21 on this machine pays 21 cents, not 79 cents as in the case of the subtracting keyboard type. One Brandt operator can supply fractional coins to envelopes as fast as three clerks can count and enclose paper currency. This model is also used in general cashier's windows for cashing payroll vouchers and paying out money against various presentations at this window."

Coinaudit and Mon-E-Meter

PNEUMATIC SCALE CORPORATION, LTD., NORFOLK DOWNS, MASS.

"Coinaudit is a machine in which is combined all of the operations of sorting, counting and placing in packages all sizes of hard money from the penny up to and including the half dollar. These operations are fully automatic; a quantity of mixed coin is poured into the hopper of the machine, the starting button is pressed and the machine proceeds to separate the various denominations of coins, dropping each lot of coin into its own particular tube into a convenient paper wrapper. Counters give the exact number of coins passing through the machine. Machine separates and counts the coins at a speed of about 250 a minute. The machine is small and compact and sufficiently large to take care of the needs of all banks and commercial houses, with the exception of probably a few of the larger institutions.

"The Mon-E-Meter machine is designed to count any one denomination of coin at a very rapid rate. The money must first be sorted—all denominations kept separate. The machine is adjustable to these various denominations. It will first count the pennies, then just by pressing the filling tube the machine is automatically set to count the nickels, and so on. The coins pass through the machine with amazing rapidity, the rate of speed being 2000 coins counted per minute.

"Both machines are electrically operated, the necessary current being drawn from any ordinary electric light outlet."

Cummins Duplex Receipting Perforator
also
Cummins Check Endorser and Check Signing Machine

CUMMINS PERFORATOR CO., 4740 RAVENSWOOD AVE., CHICAGO, ILL.

"The accomplishments of the Cummins Duplex Receipting Perforator are that in one operation the machine receipts the customer's bill, dates and initials the cashier's stub and cuts off the stub from the bill. The machine is capable of handling up to five bills per stroke.

"The advantage of the electrically operated machine over the hand-operated machine is the additional speed possible because the operator has both hands free to handle bills and also has the work table attached to the machine, and instead of using his hand to operate the lever, the machine is tripped by a touch of the foot.

"The Cummins Check Endorsing Machine is designed to be used in connection with the adding machine in the proving of clearings and in connection with the transit machine in writing collection letters or in distribution department when charging out to clearings or transit—the endorsement becomes a part of the above-mentioned operations, the machine taking the place of the work table of either machine and as the checks are turned they are dropped into the hopper of the machine instead of being stacked.

"After tripping the machine and being endorsed, the checks are deposited face down in the stacker, and in the order in which they were run, and, as the only way by which one can get a check through this machine without endorsing it is by putting through two at a time, it is obvious that if this were done there would be no balance, and when the items listed were checked up and the unlisted one found it would also be found that the next one to it was not endorsed. If, on the other hand, there is a balance, then it is certain that every item is endorsed and all the time required for hand stamping endorsements and for checking for skipped endorsements is eliminated. The quality of the work will always be of the same and of the best for the reason that the machine is not only automatic tripping and stacking but also automatic inking.

"Such quantity checks as payroll, dividend, Christmas club, etc., are signed on the regular check endorser by simply substituting a steel engraved facsimile signature die for the regular endorsing die—with the additional features of a counting device and locks (if desired)."

Hoefer Change Maker

HOEFER CHANGE MAKER CO., 3700 E. 12TH ST., KANSAS CITY, MO.

"This machine is peculiarly adapted to the change-making requirements of public utility companies in that it delivers predetermined amounts or completes change transactions with equal efficiency. The coins required either in cashing a check, filling a pay envelope or paying the balance due in a change transaction in the accounts receivable department, may be delivered instantly by the aid of this device.

"The automatic safety lock guards against possibility of short-changing on account of an empty coin channel. Interchangeable delivery attachments delivering the coins either to the operator, directly to a pay envelope, or directly to the customer, assures giving the most efficient service possible at any station in the institution. Where not required continuously at any one station, the 'Hoefer' is adaptable to part time duty at any other station and will serve there with equal efficiency through the use of whatever type of delivery may be found to be most practical for the particular purpose.

"With 'split-change' keys, penny keys and standard even-change keys segregated and of different colors, but in close proximity to each other, key selection is confined to an extremely small area, so that the simple, comprehensive keyboard permits practically instantaneous location of keys. 'Split-change' is delivered by means of blue keys, pennies are delivered by means of red keys, while standard even-change amounts are delivered by means of white keys. The intermediate mixed change amounts are delivered by means of white and red keys operated either in succession or simultaneously. Mentally, the white key precedes the red key for predetermined amounts, while the red key precedes the white key for the balance due in a change transaction. In change transactions the mental process adheres to the time proven building-up method of adding enough pennies to make even money and then the balance. As the mental operation is performed simultaneously with a part of the manual operation, the manual operation actually determines the time required to complete a transaction.

"This machine makes no pretense of eliminating the mental calculation, as to do that absolutely necessitates a mental operation to precede the manual operation, and necessitates a mental calculation after the manual operation in case the operator is to check the change as it is delivered."

International Check Endorser

THE INTERNATIONAL POSTAL SUPPLY CO., 634 PROSPECT PLACE, BROOKLYN, N. Y.

"The Model 'K' International Check Endorser is an electrically operated machine capable of separating, endorsing and stacking checks at the rate of 250 per minute. The cabinet is made of oak, walnut, mahogany or special finishes and occupies a space 28 in. x 15 in. The dies are hand engraved on hardened steel, interchangeable, and can be equipped with specials with or without batch slot arrangement. A complete set of steel type for days, months and years is included, and no additional charges above the cost of the machine are made unless the number of type characters exceeds 100. A specially prepared ink is used to protect the life of the steel dies which is free from acids and injurious substances in the following colors: Black, carmine, blue, green and violet.

"The new improved Junior Model is an electrically operated single-feed device whereby the checks are fed one at a time by the operator and has been designed for organizations whose volume of checks do not warrant the installation of the automatic. It is compact and light, with base measures of 8¾ in. x 11 in. The specially designed metal adjustable stand can be supplied so that the endorser may be placed very close to an adding machine. desk or table."

Protectograph

THE TODD CO., ROCHESTER, N. Y.

"The electric Super-Speed Protectograph is generally used for the following purposes: (1) General expense checks, (2) divided checks, (3) payroll checks. It is a compact key set machine similar in some respects to the ten key adding machine keyboards. Checks may be fed singly or in sheets, the amounts set up by touching the keys with the fingertips returned for repeat work or instantly cleared for error and printed by touching the bar at the right.

"Inking is automatic for 1200 to 1500 checks when the duplicate ink roll may be inserted within a few seconds without soiling the fingers or work.

"The words 'exactly,' 'dollars' and 'cents' are printed automatically, and only the figures are touched on the keyboard. The last two figures set up automatically become the cents. Amounts from 1 cent to $999,999.99 can be printed and checks may be written at the rate of 100 to 1200 per hour."

The Signagraph

THE SIGNATURE CO., 3 S. WILLIAM ST., NEW YORK, N. Y.

"*The Check Signagraph*—The instrument consists of a table bed with folding extension leaf; across both run at front and back a light endless chain, actuated by sprockets and a crank handle. On rotating the handle, the chains, by means of evenly spaced lugs, carry two sheets of checks (previously laid on the extension leaf) under the writing frame, upon which are two parallel rows of five Waterman's Ideal fountain pens, spaced to cover the signature ground of the checks beneath. The writing frame, supported at each end by roller bearings, is, jointly with the pens it carries, under control of a monitor penholder or handle, which, when handled as a pen, causes all the pens to respond simultaneously to its slightest movement. The writer, after signing ten checks, rotates the crank handle, throwing the signed checks around, under and into a receiving tray, while at the same time a new set of unsigned checks are drawn under the pens for signing from the extension leaf. The instrument is easily adjusted for any size of check sheet not exceeding 18¾ x 9½ in.—which measurement is in excess of any requirement for a sheet of five checks—the usual width of individual checks being 3¼ in. Average signatures on this instrument will be about 5000 per hr. The output of a few writers has been 30,000 to 31,000 in a day.

"*The Junior Signagraph*—A compact instrument mounting five Waterman's Ideal fountain pens, enclosed in finished mahogany case, 20½ x 5½ x 11 in. Adapted for signing simultaneously and continuously five checks in sheet form and adjustable to any size of checks, not exceeding 3¾ in. in width.

"When opened for use the instrument swings out from the case, the open side of which forms a writing bed.

"The regulation of pens for spacing to signature spaces on checks is easily and quickly made. The tension of each pen can be adjusted to produce uniform action of all pens. When filled the five pens will make about five thousand signatures of length employed by average single pen writer.

"Results vary with length of name and rapidity of writer, 2000 signatures an hour being a fair performance."

Steel-Strong Coin Auditing Machines

THE C. L. DOWNEY CO., 941-43 CLARK ST.,
CINCINNATI, OHIO

"This company manufactures a large number of different types of coin auditing machines. Space in this report will not permit dealing with the models individually.

"A teller may deposit any number of coins directly into the hopper of the machine, which is operated through motor control, and such coins will be automatically carried through the machine, deposited into different receiving compartments and each coin registered so that the record of the amounts in dollars and cents is shown on meters at the top of the machine.

"Among the improvements reported are a 'triple check' on each package count; micrometer gage adjustment; adjustable setting of gages to overcome wear; visible coin feed; tapered wrapper stems; unit sort and count; combination gage control; revolving lock index, and many other features contributing to accuracy of count and reliability of operation."

Todd Check Signer

THE TODD CO., ROCHESTER, N. Y.

"The Todd Check Signer is a miniature offset press. It is made in two sizes. The standard 6-unit is employed for large payroll or dividend use, writing checks in sheets of 3, 4, 5 or 6. The single-voucher unit, devised for smaller issues of checks, signs in singles, doubles or vouchers.

"The signature impression, autograph and forgery-prevention background design is made by offset lithography. The signature design plates come in contact with a rubber blanket, which transfers their reversed impression in positive form to the paper of the check, a process which contributes to safety.

"Operated by an electric motor, the Todd Check Signer requires only the attention of one employee. It runs silently and smoothly, automatically recording the number of checks it signs, cuts apart and stacks.

"Two genuine pin tumbler Yale locks of the highest quality are furnished, a master lock and a subordinate lock. The master key is kept by the executive. The subordinate key is entrusted to the actual operator of the signer. It requires both keys to unlock the machine, as in a safety deposit box.

"Built into the Todd Check Signer is a check counter or meter, which permits the executive to take positive tally of all checks which have gone through the machine."

OTHER CASHIER'S EQUIPMENT ON THE MARKET

Machine	*Manufacturer*
"National"	National Cash Register Co., Dayton, Ohio
"Remington"	Remington Cash Register Co., Ilion, N. Y.
"F & E Changer"	Hedman Mfg. Co., 1158 Center St., Chicago, Ill.
"Staats"	George F. Clute Mfg. Co., 358 W. Madison St., Chicago, Ill.
"Abbott"	Abbott Coin Counter Co., 143 St. and Wales Ave., New York, N. Y.
"American Endorser"	American Perforator Co., 624 W. Jackson Blvd., Chicago, Ill.

VI—Mail Room Equipment

Baum Folding Machine

RUSSELL ERNEST BAUM, 615 CHESTNUT ST.,
PHILADELPHIA, PA.

"This machine will fold any kind of stock from onionskin to card, in size from 5 x 6 to 14 x 19 in., one, two or three folds.

"It has been installed in many electric lighting companies especially for folding electric light bills. (Note—In a few instances it was necessary to build the folder slightly special owing to the peculiar folds in the bills.) It also will fold letters, price-lists, pamphlets, booklets, etc.

"With automatic feed, its speed is about 6000 sheets (18,000 folds) per hr. It may also be fed by hand. It is operated by a small electric motor."

Lightning Letter Sealers and Lightning Letter Openers

THE BIRCHER CO., INC., ROCHESTER, N. Y.

"Lightning Letter Sealers are manufactured in two models —Model M motor operated, and Model K hand operated by a crank.

"The Model M Lightning Sealer will handle all standard envelopes—sealing neatly and cleanly, without placing moisture on the outside of the envelopes, at a speed of approximately 12,000 envelopes per hr. All parts are machined, and the machine is strongly built to give years of service. The feed is entirely automatic, and but one letter can pass through the machine at a time—assuring every envelope being sealed. After the flap is moistened it is forced in contact with the envelope by a barred roll, all envelopes being securely sealed.

"The hand-operated Lightning Sealing Machine, Model K, is the same in mechanical principle as the power operated Model M.

"Two models of Lightning Letter Openers are manufactured—one a high speed, power operated machine, and one for hand operation.

"The Model A-5 Lightning Letter Opener opens mail at the rate of 500 letters per min. without damaging contents; the machine has an automatic feed, is motor driven, and opens mail by shearing off the edge of each envelope by circular cutters as the envelopes are driven through the machine. This model is in general use by public utility corporations throughout the country, having been in use for years.

"The hand operated Model H Lightning Letter Opener is the same in mechanical principle as the power operated Model A-5. It has a speed of about 200 letters per min.

"The power operated Model A-5 is recommended where the incoming mail averages 1000 pieces or more per day; when the mail is of smaller volume, the Model H hand operated machine is entirely satisfactory."

McKay Mailing Machines

W. L. McKAY & Co., 111 N. MARKET ST., CHICAGO, ILL.

"The Reynolds Envelope Sealer is hand operated and hand fed. Its merit lies in its extreme simplicity. The moistening device is a steel cone which never wears out and always gives a uniform and sufficient supply of moisture. The feeding is simple. Although it requires a little practice, a beginner can feed this machine at the rate of from 50 to 75 envelopes a minute, while an experienced user will feed as high as 100 a minute, a speed that is sufficient for any normal mail. It is exceptionally convenient for general office mail because no adjustments are necessary for size or thickness.

"The Sealograph is offered in three models, Model A being hand fed and hand operated, Model B, hand fed and electrically operated, and Model C, automatically fed and electrically operated. These machines, like the Reynolds, have a metal moistening device, except that this one is a disk instead of a cone. The advantage of the cone is that a longer radius is attained with less difference of speed between the center and the circumference, but in the use of a disk the flap is extended at a less angle from the body of the envelope and, therefore, clings closer to the feed-rail. The Sealograph line offers also two sets of compression rolls as against one set in the Reynolds, and the Sealograph machines are gear driven, whereas the motion is transmitted in the Reynolds Sealer by chains. These differences, however, merely are a matter of design, and one is just as good as the other in so far as the function of the machine is concerned."

Sealometer

THE INTERNATIONAL POSTAL SUPPLY CO., 634 PROSPECT PLACE, BROOKLYN, N. Y.

"International Sealometer seals, imprints and meters mail in one operation. This machine is motor driven, has automatic feed and meets Government requirements.

"It is not necessary to purchase specially made envelopes for use in the Sealometer because it handles all standard envelopes, as well as odd sizes.

"International Postage Meter is a device for printing postage directly on mail matter, and does away with the application of adhesive stamps as well as loss of same.

"Meters are under Government control, being leased, not sold, to owners of Sealometer.

"Meters register 999,999 and are set by your local postmaster for amount of postage you pay, and when placed on Sealometers the hand engraved steel die and meter act in unison in stamping and registering 'Postage Paid.'

"When the meter has run its full count up to amount paid in, the register returns to zero and the printing device is locked automatically. The descending register will show how much postage is left in meter, so if a larger mailing is expected, meter may be taken to postoffice and additional amount of postage added to the amount left.

"It is not necessary to allow meter to run its full count before resetting."

Sague Inserting Machine

INSERTING AND MAILING MACHINE CORP., 11 PARK PLACE, NEW YORK, N. Y.

"For several years this company has been developing a machine, proposed for direct mail advertising, which will gather a number of inserts, open an envelope, put the inserts into it, seal it, and either stamp it or put on a printed indicia. After the inserts are put into the envelope, the envelope is automatically calipered to insure perfect work. In other words, if there is an insert missing, or if duplicates have been gathered, the machine will automatically stop.

"Machine of this kind, this company reports, are now in successful operation.

"The machines now in use were located in various places in order that they would operate under different conditions, and valuable experience would be obtained. In every instance they have measured up to the requirements.

"No effort has been made to advertise the machine, as it was desirable to first ascertain its commercial possibilities, based on actual experience. For more than a year this machine has given satisfactory performance. A modern factory at Easton, Pa., has been built for the manufacture of this device. As soon as special tools for making these machines are completed, production on a quantity basis will begin, and a competent sales and service organization will handle this business.

"The standard device will be a so-called 4-box machine; that is, it will feed an envelope and make from one to four inserts. However, machines can be built with more boxes; in fact, one has been made with eight boxes, and one of six boxes is now being built.

"The normal speed of the standard machine is 60 per min."

OTHER MAIL ROOM EQUIPMENT ON THE MARKET

Device	*Manufacturer*
"O. K. Opener"	O. K. Manufacturing Co., Oswego, N. Y.
"Elliott Sealer"	Elliott Addressing Machine Co., Cambridge, Mass.
"Mail-O-Meter"	The Postage Meter Co., Stamford, Conn.
"Multipost Sealer"	Multipost Co., Rochester. N. Y.
"Standard Sealer and Printer"	Standard Mailing Machine Co., Everett, Mass.
"Thexton Sealer"	W. L. McKay & Co., 111 N. Market St., Chicago, Ill.
"Cleveland Folder"	Cleveland Folding Machine Co., Cleveland, Ohio.
"Multigraph Folder"	American Multigraph Sales Co., Cleveland, Ohio
"Mack Postage Meter"	Mack Postograph Co., Los Angeles, Cal.
"Pitney-Bowes Meter and Permit Machine"	Pitney-Bowes Postage Meter Co., Stamford, Conn.
"Red Star Mailing Machine"	Red Star Appliances, Inc., Stamford, Conn.

VII—Tabulating Machines

No replies were received from the four companies written.

TABULATING MACHINES ON THE MARKET

Machine	*Manufacturer*
"Hollerith"	International Business Machines Corp., 50 Broad St., New York, N. Y.
"Electric Error Indicator"	The Signal Specialties Co., 4046 W. Philadelphia Ave., Detroit, Mich.
"Powers"	Powers Accounting Machine Corp., 474 Broadway, New York, N. Y.
"National Tabulator"	National Cash Register Co., Dayton, Ohio

VIII—Miscellaneous

Bostitch Fastener

Charles N. Smart, 261 Franklin St., Boston, Mass.

"The Bostitch Fastener is a light, portable desk machine, made of steel, cadmium and nickel-plated to prevent rust. It uses a ½-in. wide staple with ¼-in. long leg, made of 0.019 tinned steel wire, put up in cores, holding 210 staples attached to each other for convenient handling. One core of staples fills the magazine in the machine. The machine operates by a light pressure on the knob, forcing the staple through the work to be fastened together and clinching it on the underside. The clinch is turned in so that it will not pick up additional papers, but can be removed by bending the back of the staple slightly. This machine will fasten papers from two sheets up to forty sheets, depending on the texture and thickness of the paper.

"The Bostitch Style C is a heavier machine than the Standard Bostitch and stitches from two sheets to ⅜ in. in thickness, using different lengths and sizes of staples for various thicknesses. These staples are put up in the same manner, packed as the regular Bostitch, staples being attached to each other in the same way.

"A new model, foot operated table type, using the small size fasteners and constructed entirely of steel, is being placed on the market. This machine is easily and quietly operated, and can be used for such work as attaching delinquent notices to outgoing bills with greater speed than hand machines, as both the operator's hands are free to manipulate the papers."

McBee Metal Back Machine Binder

The McBee Binder Co., Athens, Ohio

"This machine will bind loose-leaf records into a book of any size up to 22 in. on the binding side, with no limitations on the other side. The unit consists of devices for forming and shaping, compressing and drilling the sheets. It is motor driven and equipped with four drills placed on a cross rod, and can be set to within 1 in. of each other, being so controlled that from one to four holes can be drilled at a time.

"Binders are made in various styles—particularly in plain board with canvas corners or full canvas covered with slate or brown colored canvas and paper lined. A metal back made of cold-rolled steel covered with canvas is formed and drilled by the machine.

"To bind into book form, a top and bottom cover with metal back are prepared and bound together by saw tooth binding nails. This makes a very permanent binder which, if necessary, can be unbound by a tool which is usually kept in the possession of the office manager.

"The machines are loaned (gratis) to companies who have a sufficient volume of permanent binding of records to warrant them contracting with this company to purchase a specified amount of material over a given period. Many other types of binders, both for active loose-leaf work and permanent records, are manufactured by this company, and the purchase of any other material or equipment whatsoever can be applied on the contract.

"The operation of the machine is simple and the upkeep cost practically negligible, as drills are the only accessory necessary."

Teletype

Morkrum-Kleinschmidt Corp., 1400 Wrightwood Ave., Chicago, Ill.

"Teletype is essentially a distantly controlled typewriter, operating like an ordinary typewriter and resembling it in many respects. The depression of a key on the keyboard of the Sending Teletype will cause the corresponding character to be printed on this machine, and at the same time will automatically typewrite the message on any machine or machines connected to this point by a system of wires.

"Systems can be arranged with any number of instruments located at any distances apart. The circuits can be arranged so that any desired interconnections between machines can be made. Machines are made in two types—the Page Type, which typewrites its message on a standard width sheet, and the Tape Type, which records its message on a narrow ribbon of paper.

"Teletype has the flexibility of telephone systems and the accuracy and permanency of the typewritten page."

Miscellaneous Equipment on the Market

Device	*Manufacturer*
"Dictaphone"	Dictaphone Corp., 154 Nassau St., New York, N. Y.
"Ediphones"	Thomas A. Edison, Inc., Orange, N. J.
"Remington Electric Typewriter"	Remington Typewriter Co., 374 Broadway, New York, N. Y.

THE USE OF A FIXED CAPITAL RECORDS SYSTEM FOR INSURANCE AND TAXATION PURPOSES

SUMMARY

This report is intended to give the utility executive a brief outline of the use of a Fixed Capital Records System for Insurance and Taxation Purposes.

A Fixed Capital Records System provides and perpetuates the data necessary for any company to enjoy the following advantages:

For Insurance Purposes

1. Full insurance coverage for any kind of insurance for the company's property at all times, providing a simple basis for the elimination of non-insurable property and automatically providing for necessary increases or decreases in insurable values to take care of additions or retirements of insurable property.
2. Complete inventory and cost data necessary to substantiate claims for loss.
3. Complete control of the payment of insurance premiums by elimination of the premiums for non-insurable property and property retired, and by the adjustment of premiums for changes in property which improve its insurance rating.

For Taxation Purposes

1. Complete data on the cost of the company's property subject to taxation in each political subdivision, providing a simple basis for the elimination of the cost of non-taxable property and automatically providing cost data on additions and retirements of taxable property. This serves as a check on the assessed valuation at all times.
2. Complete data on the number of units of property subject to taxation, such as poles, miles of wire, feet of mains, etc., in any locality at all times.
3. The data provided in 1. and 2 help to protect the company against the payment of excess taxes on any part of its property.

The details of how a Fixed Capital Records System provides and perpetuates these data are discussed in the various subheadings in the Report. The conclusions point out seven important items of insurance and taxation records which are provided by a Fixed Capital Records System at less cost than they could otherwise be obtained.

INTRODUCTION

A Fixed Capital Records System of some description has now been installed by many public utility companies, as it has been proved that the benefits derived from such records are no longer theoretical but are established facts.

There are many uses for such a system, one of the most valuable, and one that will reflect large savings, being the use of these records for insurance and taxation purposes.

Several types of Fixed Capital Records Systems of greater or lesser detail have been described in prior reports of this Committee. In general these systems provide records which segregate the units of the property in such a manner that the date of installation, description, location and cost in place of each individual unit, or the average cost in place of substantially identical units in each section of the property, can be readily obtained.

A completely detailed system obviously gives the greatest amount of data, but even the simplest Fixed Capital Records System will provide sufficient data and information for insurance and taxation purposes.

The purpose of this Report is to show how the records of a Fixed Capital Records System may be used to provide the data necessary for insurance and taxation purposes, and how these data can also be coordinated with, and used to regulate and control, insurance and tax records.

It is important in the case of any kind of insurance to know that all property which should be insured is adequately covered, and that the insurable values are neither too high nor too low, and likewise that the values of foundations, etc., which are excluded from coverage, are eliminated when determining insurable values. This guarantees ample protection and prevents payment of excess premiums. After having adequately covered the property with insurance, it is important that insurance be taken out or cancelled immediately when new property is added or old property retired. It is also essential that certain detailed records of insurable property be available so that in case of a loss, full claim for same can be readily and accurately determined and also substantiated.

In connection with taxation it is important for the company to have accurate records and values of its entire property, or parts of its property, subject to taxation, which are located in the various political subdivisions of the territory served, as well as a record of all property acquired or sold. The company will then be in a position to know at all times whether the assessed value or the taxes levied are reasonable and correct.

It is the experience of the various member companies who now maintain Fixed Capital Records Systems of their property that, since these records act as a complete detailed control of all physical property, they are easily coordinated with and used to perpetuate insurance and taxation records.

Within its scope this Report will discuss some of the problems arising in connection with insurance and taxation matters. It will also indicate certain

---

Publication No. 289-79, Serial Report, Fixed Capital Committee.

detailed information which is essential for the correct solution of such problems and show the advantage of obtaining this information from a Fixed Capital Records System.

INSURANCE

Insurable Property with Descriptions, Locations, Etc.

In taking out any kind of insurance the first thing to determine is what property shall be covered. This is a matter of policy with each company, but when this has been definitely determined it is then necessary to provide such data and values as are required, in order to properly prepare the insurance schedule for the various policies or contracts. The value of the insurance to the insured depends largely upon the completeness and the accuracy of the facts given in these schedules, and it is, therefore, important that these data be obtained from a very reliable source.

For fire insurance it is necessary to give the definite location, complete description and the insurable value for each individual item or group of property being insured. A Fixed Capital Records System segregates the units of property in such a manner that these data can be readily obtained, and this is one of the important functions of such a system. The preparation of schedules for fire insurance purposes is, therefore, greatly simplified, as the information required is already available in a Fixed Capital Records System, and it is necessary to compile from the records of such a system only such data as are required for the particular item or section of property on which insurance is to be carried.

One of the most difficult matters, and one that is of considerable importance when taking out fire insurance, is to ascertain the value of such parts of the property being insured which are excluded from coverage, such as foundations of buildings and equipment, underground piping, equipment wholly or partially submerged in water, etc. The costs of all such sections of buildings or equipment are properly segregated in the records of a Fixed Capital Records System, and consequently it is an easy matter to exclude their values in preparing the insurable values. In this manner the insured is confident that insurance is being carried on the insurable value of only such parts of property as are actually covered by the policy.

It is apparent that the values of the units of property as shown in a Fixed Capital Records System are not always the values that will be carried on the insurance policy, for the insurable values must take into account the cost to replace the property at price levels existing at the time the insurance policies or contracts are executed, as well as the accrued depreciation on same. These values must be sound insurable values, neither too high nor too low, as values that are too high will cause the insured to pay an excessive premium without coverage, and values that are too low will not provide for sufficient coverage in case of loss.

The values shown in a Fixed Capital Records System are the original costs of the property at the date of installation or acquisition. However, these values do provide an accurate basis for determining the true insurable value for each unit of insurable property. The original cost of the various items of property to be insured may be adjusted to a reproduction cost basis by applying suitable price trend factors to the detailed unit costs obtained from a Fixed Capital Records System. Such a system also gives inventory details and quantities of material and labor which may be priced on a reproduction cost basis by applying current prices as of any date.

The reproduction costs new of insurable property can then be depreciated as desired. The field work done and the close study of the condition of the various items of property afforded by the maintenance of a Fixed Capital Records System, gives an excellent basis for determining the proper depreciation of each item—a far better basis than one which uses the theory involving the age of the item and its estimated life.

In cases where all or part of the fire insurance is carried on a Blanket Policy, it is a simple matter to use the records of a Fixed Capital Records System in accumulating the data for the particular kind of equipment included in such policies, as these records are so flexible that the information needed can be secured for any group of units, particular location, section or political subdivision of property.

Companies which do not maintain a Fixed Capital Records System usually have no adequate records which give readily the necessary information and details outlined above. They must, therefore, resort to other methods of obtaining inventories, descriptions and other data for determining insurable values. Such companies must base their values for insurance purposes either upon estimates made by their own employees or upon studies made by outside engineers. In both cases these estimates would probably be based on detailed studies made with the view of using them only for insurance purposes, and they would have to be made or revised each time the policy was renewed or revised. Such studies might be sufficiently accurate, but they would certainly cost more to make than if the data were supplied from a Fixed Capital Records System which is continuous in its operation.

The data and information required by insurance companies for automobile, boiler and other types of insurance is practically the same as that required for fire insurance; and as the record in a Fixed Capital Records System is set up in the same manner for each unit of equipment, it is obvious that it can be used to the same advantage and with the same benefits in preparing schedules for other insurance as for fire insurance.

Increases and Decreases in Insurable Property

Companies are continually making changes and additions to their property or retiring structures or equipment which are replaced or removed; therefore, if the proper coverage is to be maintained, the insurance records should also be changed to reflect the increase or decrease in the value of insurable property affected by these changes.

It has been stated that a Fixed Capital Records System constitutes a perpetual inventory of the physical units of property; therefore, if the insurance records are based on such a system, it is logical that they will immediately reflect every change in insurable property and the amount of coverage will also be corrected, the result being that insurance will be taken out for new property as soon as it is installed, likewise cancelled immediately on all property retired. As a consequence, the insurable values of the various items of property are revised automatically when the Fixed Capital Records are corrected and are not dependent on special inspection or studies, or whether someone happens to remember that certain property has been installed or removed. This results in complete coverage and eliminates the possible payment of insurance premiums on property long after it has been removed.

Improvements are continually being made to the property, many of which have a direct effect on the insurance rate. All such improvements are reflected in the operation of a Fixed Capital Records System; therefore, any improvements which will affect the insurance rate at a certain location are immediately reported to the insurance company, and as a result thereof the rate for the particular property is revised by the insurance underwriters, and proper credit allowed by the insurance company long before such changes would be found in a regular insurance inspection of the property.

Claims for Loss

When a loss occurs on any property covered by insurance, the insured wants to be in such a position that the claim presented covers the value of all the property destroyed or damaged, and it is at this time that the importance of having available reliable and accurate insurance records is realized.

From a physical inspection after a fire it is not always possible to ascertain the complete list of items destroyed, and, therefore, in order to prepare a claim for loss that will cover the maximum loss sustained, it is necessary that the records of the property destroyed are in sufficient detail that a complete inventory is available which will show all the items that were in existence prior to the fire.

The value of the property destroyed may be determined by means of estimates based on the present cost of replacing the property, but this value, if based on a complete, accurate and dependable record, is far more convincing than any estimate which may be made.

A Fixed Capital Records System is, without question, the best source for obtaining the data required in setting up and proving a claim for loss on any insured property, as such a system provides information which is complete, up to date, reliable and dependable in every way; thus all evidence of the property destroyed can be produced and the claim for loss easily substantiated.

TAXES

Taxable Property Segregated Into Units, Sections, Political Subdivisions with Descriptions, Values, Etc.

The property of any company may be subject to taxation in any of the political subdivisions in which it serves. It is also true that only certain items of property are taxable in cities and towns, and then again the property may be wholly tax exempt. Certain taxes levied are figured at so much per pole, or mile of wire, or foot of main, or any other unit and at various rates per year on property in different localities or on the total property owned by the company in any political subdivision.

It follows, therefore, that any company whose property is subject to taxation may keep complete and accurate records of its property at every location and in the various political subdivisions in which it renders service or owns property. The kind of detail which should be shown by such records depends entirely on the kind of taxes levied and the basis of their determination.

If the company's property in any locality is taxable at some annual charge per pole, per mile of wire, or per foot of main on the streets and highways, it is obviously necessary for the company to know the number of poles, miles of wire or other items existing on the streets and highways at the time the tax was levied. If the records are not accurate it is entirely possible for the company to be taxed for more of these items than it owns, for similar items not owned by it but owned by other companies, or for similar items which are owned but located on private property and which usually are not taxable in such locations.

In the matter of the value of any property subject to tax, except those items which may be taxed at a fixed annual amount regardless of their value, the company should have accurate and complete records of its cost to be used as a basis for checking or determining the proper assessed value used for purposes of taxation. With such records the company would be in a position to protect itself from inequitable taxation and would thereby save itself considerable expense, not only in taxes alone but also in the cost of proving what it considers a fair assessment of its taxable property.

The records of a Fixed Capital Records System provide all of the data pointed out above necessary for purposes of taxation. It has already been explained that such a system constitutes a perpetual inventory of the property in existence in any location and gives the total cost of such property at any date and, as such, offers a complete and accurate set of records which can be used in connection with taxation matters.

Increases and Decreases in Taxable Property

As in the case of insurable values of property, any extensions, additions or improvements to properties or retirements of property in a great many cases will affect the value or number of items of property subject to taxation. If a tax is levied on the number of poles in any locality or on other units of property, the net change in the number of such units in any year or other period of time, whether it be an increase or a decrease, is the factor controlling the increase or decrease in the tax. It is, therefore, important for the company to have accurate records of such changes, to protect itself against excess taxes and to provide the tax authorities with accurate data upon which they must be somewhat dependent when calculating the tax levied against the company.

In cases where an individual item of property may be taxed in a certain locality, or where the entire property within any political division is subject to taxation, it is equally important to have records which will show the increases or decreases in the value of such property.

The above changes in physical property are all recorded in any Fixed Capital Records System, and as such a system perpetuates these data, it can be used equally as well for taxation as for insurance purposes.

CONCLUSION

Although not designed to supply information and data for insurance and taxation records, a Fixed Capital Records System can be very easily adapted to, and used to great advantage in, regulating and controlling these records. The cost of maintaining insurance and tax records by coordinating them with the records of such a system is undoubtedly far less than the cost of making individual inspections and studies for similar purposes.

The value of using a Fixed Capital Records System for insurance and taxation purposes is, therefore, inestimable, as these records act as a complete control for all physical property and provide the following data, which are necessary for adequate insurance and tax records, thereby assuring full insurance protection at a minimum of cost and a definite check on all taxable property:

1. A complete and accurate description, perpetual inventory and record of cost of all property which should be covered by insurance of various kinds, or which is subject to taxation in any political subdivision.
2. A basis for excluding from insurable values the value of property not intended to be covered by insurance or parts of property excluded from coverage, such as foundations, etc., thus assuring correct coverage and eliminating the payments of insurance premiums on non-insurable property.
3. A basis for segregating and excluding the value of any property not subject to taxation, or for determining the correct number of units of property on which certain taxes are based.
4. Values of taxable property, which can be used as a basis to determine whether the assessment for taxation purposes is correct, thus preventing unjust tax assessments and the consequent payment of excess taxes.
5. A record of additions, betterments, improvements and retirements of property, thus providing an accurate and practically automatic method of revising insurable values or tax assessments and eliminating the possible payment of insurance premiums or taxes after property has been removed.
6. A basis for settlement of claims for loss against insurance of various kinds which guarantees that not only the full insurable value of every item of property destroyed or damaged will be included in the claim, but also that the amount of the claim can be substantiated.
7. Other information and details of property used in general in connection with the maintenance of proper insurance and tax records.

PUBLIC UTILITY SALVAGE METHODS

The subject of salvage and salvaging methods is so large that it would take more than a large book to contain all that might be written of its application to public utilities alone. It was determined, therefore, in this report to confine the discussion to some of the outstanding points which especially merited review, while through lack of space it would be necessary to omit any mention of items of perhaps equal importance. To those who have made a study of this subject some of the points discussed herein may seem elementary. It should be remembered, however, that some companies have not been able to work these matters out to their own satisfaction, and when they do it will be necessary to start at the beginning.

In order that there will be no misunderstanding of the terminology used in this paper it has been decided to define some of the more commonly used terms below:

Salvage Material.—Used material or apparatus which has been "rescued from waste" and which, after being sorted or graded is available for further use "as is," or may be reconditioned for further use.

Junk.—That part of Salvage Material which from its nature and condition is unfit for further use and whose monetary value lies in what can be realized from the sale of its component parts.

Reconditioning.—Putting used materials, merchandise or apparatus back into such a condition that it can be used for the purpose for which it was originally made.

Reclamation.—A general term embracing both Reconditioning and Salvaging.

Rehabilitation.—This term is used principally with reference to bringing run-down or obsolete buildings, plants and properties back into a satisfactory condition.

The whole subject of Salvage Work is much broader than is generally realized. To mention Salvage to the ordinary man is to bring before him a picture of a pile of scrap iron or copper wire, a few boxes or cans full of metals roughly sorted into various grades, all of which the junk men are periodically called upon to buy. This, however, is only one part of a broad subject which deals first with the conservation of materials and through this with the conservation of human energy. Salvaging means "rescuing from waste," but if the waste be forestalled and prevented through the efforts of a Salvage Organization, this intangible result is certainly to their credit.

It will not be hard to prove that this subject is of prime interest to companies of all sizes. Generally, the contention is that a small utility cannot afford to establish any definite department for this purpose. On the contrary, the small utility, if successfully operated, may not have a Salvage Engineer, but a so-called handy man, who actually sorts over the returned material from various parts of the system and repairs and puts back into the stockroom those items which he is equipped to repair. The opportunities for savings in this line are proportionately as large in the small utility as in the larger utilities.

As the company grows larger the salvage methods which were previously more or less satisfactory become inadequate. The company gets into a more diversified line of equipment and greater quantities of materials have to be salvaged. It is not a matter of choice whether they go into the salvage business or not, as the natural growth of the company and the progress of the electrical industry forces them into it. The policy which each company adopts in handling this matter is an important decision and one which will have an important bearing on their future success.

In some companies there may be important reasons why salvage materials, on their hands through no choice of theirs, may not be handled so as to bring the best returns. These are matters for executive decision, but for those who wish to realize the highest possible return from salvage materials there is a great field for lower handling costs and improved methods.

Although the smaller companies may get by satisfactorily by having one or more men spend part time on salvage, the amount of material handled by the larger companies demands that more attention be given to it. In practically every company the material naturally comes into the custody of the storekeeper, who, by his training and facilities, is best fitted to handle it. It is a storekeeping problem, therefore, to expand the facilities to give such material the proper attention and to develop a competent organization to supervise it.

One of the first points which will come to the mind of an aggressive salvage man in a public utility is to wonder whether he is receiving all the material that he should receive from the various jobs and whether the field conditions in connection with this work are what they should be. He has the choice of dealing with only what is turned over to him, or, on the other hand, of adopting an aggressive policy leading back to the source of the material.

True salvage work goes into all branches of the company where waste of material may be avoided or where material may be rescued from waste. Investigation will probably disclose that while no material is wilfully wasted, a great many chances to practise economies through salvage methods are missed through lack of education. The principles of salvage work will have to be sold to department heads and through them to their men in the field. One of the large utilities adopted an aggressive policy as an experiment, and the results were more than gratifying—they were startling. It was found that through contact with the field men of the various departments, they could be educated to use up materials with less waste and to salvage materials which were formerly wasted entirely. All this was done without lowering any standards of work and without appreciably running up the various departmental costs. Needless to say, the moral effect on the outside departments is an important item. One direct effect of this field work was that all usable material

---

Publication No. 289-55, Serial Report, Purchasing and Storeroom Committee.

was consumed on the jobs, and that only junk materials and excess materials were returned for credit. It has also been noted that materials removed from property have come back to the storeroom in much better shape. This shows that the workmen had the proper policy impressed upon them and that they realized that the materials had a potential value for a further company use, or for resale. One of the experiments conducted by this utility was to give the Salvage Engineer complete supervision over the dismantling of a large substation. The removal of every piece of equipment, large and small, was done according to his ideas, and the work was so carefully done that very little good material was damaged. The general results were so surprisingly good that all large removal jobs are now closely supervised by the Salvage Engineer to prevent damage and loss of good materials. The Salvage Engineer does not hesitate to follow up any promising leads in connection with Salvage work. These leads often bring him to certain salvage operations which must necessarily be performed by other departments. In spite of this he compiles complete data on same, as the Stores Department and the company in general expects him to be completely posted on these matters. The various company departments are completely sold on the salvage question, and they are kept in touch with salvage available for their use through the medium of a monthly salvage catalog, issued by the Stores Department. The development of an adequate Salvage Headquarters and an efficient Salvage Organization has been an interesting process, which as it progressed opened up more and more possibilities.

The storing and selling of used equipment, not required for further company use, is a matter which should be given careful attention. Those in charge of the selling of such equipment should be careful not to allow handling and storage charges to accumulate to such a point that the transactions may show an actual loss. A definite policy should be adopted in which the following points should be embodied:

(a) Procure advance notice of machinery and equipment about to be retired.

(b) After determining that it cannot be used within the company, decide whether there is a possibility of sale outside. If there is, try to sell it on the spot, making concessions on price to cover expenses which would otherwise be incurred if you removed it yourself. If not, scrap it on the job and avoid handling expenses at Salvage Headquarters.

(c) Do not keep items of machinery or equipment for sale at salvage headquarters too long. If price reductions to somewhere near scrap price do not move the items, they should be scrapped promptly. Whatever your selling plan is, put it into action quickly. It is only by prompt and concerted action of those in charge of storing and selling surplus equipment that any satisfaction can be obtained.

The other extreme is to fill the warehouses with such material and perhaps erect new buildings to take care of the overflow. In this class of material at least the buying public will not wear a path to your door.

The selling of scrap metals, etc., is quite a different matter from selling used equipment and machinery. In the first place, a comprehensive scrap classification should be adopted, preferably the one which is generally used by the scrap trade. In this way the return on graded metals, etc., can be checked against the newspapers and trade journals, narrowing the element of chance to those items which, for various reasons, are sold ungraded.

The degree of refinement in grading scrap and the methods used in getting this result, brings us to the principal subject in this review. There may be considerable differences of opinion within the industry as to the wisdom and practicability of some of these methods, but the fact remains that they are being successfully employed by salvage men in some of our leading utilities. It is a matter of good judgment to keep a close watch on the costs of the various salvage operations and to avoid, if possible, all unprofitable operations.

REVIEW OF SALVAGE METHODS

Salvage materials can be divided into the following classes:

1. Junk.
2. Salvage Materials and Equipment for Sale.
3. Salvage Materials and Equipment for Further Use.

For the purposes of this review the work done by the storekeeping organization in putting back into stock items which are returned from the system on which no reconditioning has to be performed, is not classed as "Salvage Work" but is simply storekeeping routine. It is good storekeeping also to see that the odds and ends of new stock are properly used up, and it is upon this assumption that we start the discussion of salvage methods with matters somewhat beyond ordinary storekeeping routine.

This review will cover only the more important phases of the items which are selected for discussion. This whole subject may well come up for review every year so that the latest developments may be available for those who are interested.

Junk

Junk is defined in this paper as "Salvage Material which from its nature and condition is unfit for further use," and includes numerous metals and materials of all kinds and combinations. There is a natural flow of such material to the salvage headquarters if a proper working arrangement exists with the various company departments. It has been demonstrated and is strongly recommended that methodical arrangements for the collection of junk at the source are superior to the casual receiving of what the departments see fit to send in. The various departments should be given an adequate supply of cans, boxes or other suitable containers and instructed to use them for scrap metals, etc. These containers should be collected at regular intervals by the Salvage Department. Junk which cannot be placed in containers should be laid aside in some convenient place designated by the Salvage Engineer so that he can conveniently inspect same and arrange for its disposition.

After the junk has been collected into a central salvage headquarters, the next step is to sort it into grades preparatory to selling it. It is again emphasized that junk should be classified under names generally understood in the waste trade. The method of separating and grading scrap materials depends upon their condition when received and upon the amount of work which each company decides to do in order to prepare the materials for sale. Under the lowest form of grading (which is practically no grading at all) materials and mixtures of materials are sold "by the lot" or at arbitrary prices based upon guesswork. The seller of mixed lots in which two or more metals and other constituents are included may gage his values on analysis and may or may not receive a commensurate return. For those who wish to know exactly what they are selling and wish to obtain the highest return therefor, some of the methods in use will be explained in this review.

It is unreservedly advocated that every utility, regardless of size, have some central point in their Stores system through which salvage materials will be cleared. There will be certain exceptions, of course, where some items will be disposed of at the source, but even these should be under the same supervision. It is also advocated that the collection and the preparation of salvage for sale be centralized.

A Salvage Headquarters may be operated in connection with a warehouse, but it is preferable to have the salvage materials and the salvage operations separate from everything else. It should always be kept in mind that in preparing scrap for sale the salvage organization is pitting its equipment, labor and skill against that of the junk man, and that every operation must pay its own way. Equipment should be invested in judiciously after careful investigation of local conditions and possible savings.

Junk items will be reviewed below, together with the equipment and methods employed in connection with them.

Appliances, Electric

The public utility business is a comparatively new business as compared with others which have been in existence many years, but new as it is, continuous strides have been made in the last twenty-five years in the developing of new appliances for use in the home, factory and commercial institutions. The very nature of electricity is such that after these new appliances are brought on the market the public utility must adopt a very broad attitude relative to the education of their customers to these new developments through the demonstration of the new appliances. With the average housewife a newly developed electrical appliance, or piece of household apparatus, is somewhat of a mystery and consequently the housewife is very loath to purchase such an appliance or piece of household apparatus without a thorough trial, and this fact in itself crowds the public utility storerooms with many items of electrical appliances which have been used for demonstrating purposes. This condition of development and experimentation through which the electrical industry has been progressing, and will continue to progress in the future, should direct the attention of public utility executives to the need of some systematic method of reconditioning such used articles. After this reconditioning, further systematic efforts to place these articles on the lines as users of energy through its regular salespeople are of prime importance.

Many items of electrical merchandise are sold on an instalment basis, and in some of these cases where misfortune overtakes the prospective owners of these appliances it is necessary for the public utilities to repossess the items in question. Such articles when returned to stock are very often not in a condition which would attract purchasers, and this fact in many cases is the influence which governs the Sales Department in the return of such merchandise to the storeroom where, if constant vigilance is relaxed, it will be placed in some recess where in many storerooms it will acquire a continuously increasing layer of dust.

The Stores Department could with profit take upon themselves the responsibility for placing in a salable condition such merchandise that is in need of reconditioning to enhance its sales possibility. There are many items which come under this category. Washing machines, electric ranges, fans, vacuum cleaners, percolators, toasters and irons are among the many items on which reconditioning is necessary. The tools required for this are few in number and not expensive. In addition to the necessary wrenches, screw drivers, etc., a portable buffing outfit and paint-spraying machine could form the nucleus of the tools necessary for such an activity.

In the event that an electric property is composed of small towns, it would be entirely possible to recondition articles of merchandise at a central location where the necessary tools and help would be available. In the case of most articles on which reconditioning is necessary it is principally a case of giving the articles in question a thorough cleaning. On other articles, however, a paint job might be necessary, and in such cases the paint-spraying machine is a very useful appliance. One utility has utilized the services of an automobile enameling shop in connection with the reconditioning of electric washing machines. An electric washing machine can be reenameled at a very small cost in a color which would make it an attractive article of merchandise, rather than an item which would constitute a hindrance to the merchandise turnover.

It is quite obvious that the easiest sale of merchandise and appliances is the sale of new merchandise and appliances. The sale of a second-hand or shop-worn item requires more individual attention on the part of a sales representative than does the sale of a new appliance. It is necessary, therefore, that some branch of the company interest itself constantly in a systematic method of continually reconditioning items of merchandise requiring resale, and to constantly place before the salespeople the need for merchandising activity on the reconditioned articles available for resale. Many companies make it a practice to offer these items at attractive prices to employees before they are placed on public sale. This can be readily accomplished by the publishing periodically of descriptive lists.

The Stores Department is interested in the turnover of the total stock account, and it is from this standpoint that pressure may be brought by the Stores Department on the Sales Department to induce it to move these articles.

In some companies such a reconditioning of merchandising is already a part of the organization structure, and it may or may not be in the Stores Department; however, in other companies this part of the organization has either been overlooked or not felt sufficiently important to warrant the attention of executives, and in such companies where this kind of a service is not now existent it is suggested that it can be readily incorporated in the Stores Department of their business. Such an activity on the part of the Stores Department would not only reflect a profit but would serve to place on the active list many items of merchandise which are now on the inactive list.

Appliances, Office

It is inevitable that there will be a continual advance in the development of new office appliances designed to lighten the clerical burdens in our utilities. When new appliances are adopted, those which are replaced and whcih still have much useful life should be placed in the custody of the Salvage Department. If it is not possible to trade them in on the purchase of the new equipment, inquiry should be made as to whether it would be used elsewhere within the company and, if not, they should be placed on sale before they become obsolete.

Boxes and Crates

An appreciable part of the cost of goods received from vendors is represented in boxing and crating, and it is well worth while to partially offset this expense by salvage methods. A canvass of the company will probably enable the Salvage man to place the greater portion of the good wooden boxes and cardboard cartons for various uses within departments and for shipping and the remainder may be sold. Crating lumber may be cut up for other purposes such as grade stakes, etc.

Brick, Common

The reclaiming of second-hand common brick for further use is not always profitable. The cost of cleaning, hauling and handling, together with its restricted use, sometimes makes the proposition anything but attractive. Sometimes, however, the conditions are favorable and the Salvage Department should be guided by local conditions. It is always advisable to have a small quantity on hand for repair work and for such new jobs on which they may be used.

Burlap

In addition to its value as a junk item for sale, burlap may be put to good use within the company, such as protecting items for shipping or storage. In checking up the uses of wiping rags, one company found that a large amount was used in plugging pipes on construction jobs. It was found that scrap burlap was just as satisfactory for this purpose and a sufficient supply was reserved instead of being sold.

Cable, Lead Covered

Scrap cable is perhaps the largest and most valuable item of junk handled by public utilities, and as it contains two commodities, copper and lead, for which there is always a ready market, the methods of preparing it for sale should be carefully considered. There are three common methods now in use:

(a) *Sale based upon analysis.* The metal content may be approximately determined by analysis of samples. This method is fairly satisfactory if each size is weighed and sold separately with sealed ends and joints excluded. The great element of doubt under this method is the proper allowance to make the junk man for his labor in recovering the metals. He may be able to employ cheaper labor but is not in a position to develop machinery and methods as well as a public utility.

(b) *Mechanical Separation.* The copper and lead may be separated by mechanical means. This may be the crude hammer and knife, the motordriven rotary knives, which have been in use for several years, or some other mechanical equipment. It is doubtful if satisfactory costs can be effected and a large production handled with the machinery now developed. It must be admitted that the scrap trade prefer copper and lead produced by this method and the development of satisfactory machinery will be followed with great interest.

(c) *Separation by Furnace.* The reduction of scrap cable to its component metals by means of a furnace is the method used by a great number of utilities. This method has the great advantage of low cost per ton handled and the final elimination of the useless insulation, filler, etc., also a large production can be handled quickly and in a comparatively small space. These advantages more than compensate for the small percentage of metals lost in the burning operation. If the work is properly done the metals will command the highest market prices, and there will be the satisfaction of knowing exactly what is being sold and what it costs to produce it, which is not possible under the analysis method. A means has been found to eliminate the objectionable smoke produced in the furnace and is described elsewhere in this review.

The copper from cable will take the highest grading, and if it is desired to bale it this can readily be done on account of the annealing which it has undergone in the furnace.

The lead from cables always has a wide and ready market, and in many cases a great deal can be used within the company for various purposes. It should be cast in pigs of a convenient size for the trade. One company found a new market for its scrap lead by casting it in small pigs of a size designated by the customer.

The work of salvaging can be done so as to insure that the lead will be free from traces of metals other than those in the original composition of the cable sheath.

It has been found well worth while to separate the seals on the ends of the cables and the soldered ends of the cable joints on account of the tin content. One company makes it a practice to accumulate all the scrapped cable joints and run them in separate lots through their scrap furnace. The lead and solder is run off and the resulting mixture is segregated from the ordinary lead on account of being worth about 50 per cent more. The conductors with their sleeves are pulled out of the fire before they get too hot and the sleeves are melted off by dipping in a pot of hot lead. This allows the sleeves to be reclaimed for further use.

Cinders

The use of cinders for such purposes as fill for roadways, yards, etc., and as foundation for floors and sidewalks, has been long established. In some localities they are made into building brick and block with good success. The whole matter of cinder disposition might well be placed in the hands of a Salvage Engineer with the idea of finding uses within the company, getting the best possible revenue from the portion not needed for company use.

Conduit, Fiber

Pieces of fiber conduit returned from jobs are usually found to be broken or chipped on one or both ends. There is a machine on the market with which the ends can be squared off and properly tapered. In this way the waste of this material will be reduced to a minimum.

Drums, Non-Returnable

Drums make excellent containers for junk of various sorts, including oils, etc. The tops may be cut out and handles or eyes for lifting hooks should be put on. They should be painted a uniform color and stenciled to show their use and return instructions. Those which are not used in this way have a resale value which in some localities is as high as a dollar each.

Fire-Brick

Old fire-brick may be ground into calcined clay which may be mixed with raw or green fire-clay in preparing filler to be used in laying fire-brick. Machines are on the market which will grind the old fire-brick so that the product removed by air separation from the pulverizer will all pass through a 40-mesh sieve. The cost of the product so recovered is estimated at one-sixth the cost of new material and represents a handsome saving. Special attention should be paid to selection of bricks to be pulverized to insure that no unsuitable brick (such as those covered by slag) are used, as they would reduce the refractoriness of the calcined clay.

In addition to the above use a certain proportion of second-hand fire-brick may be used for backing in maintenance or new construction work.

Fittings

Second-hand pipe fittings of all kinds are usually reclaimable, but not always for their original purposes. Small valves can be satisfactorily reconditioned for well under 50 per cent of their original cost. The process is simple: Take down the valve and immerse in a good cleaning compound to remove all foreign substances. Reseat, put in a new disk and assemble the valve and you have an article practically as good as new. It is recommended that they be subjected to a standard test before being used again. Reclaimed pipe fittings can be used on temporary work, but they are not recommended for new work if they would lower the standard of construction. There are certain exceptions to this, as many fittings, especially the flanged fittings, are not injured by being put into service and taken out again. It is a good idea to have all second-hand fittings come to the Salvage Headquarters rather than try to work them off at various stockrooms as orders which can be filled with this class of material can be taken care of from one point more satisfactorily.

Furniture, Office

Every company has surplus office furniture at some time or other. Unless it is cleared through some central point, it is probable that chances for its further use will be overlooked and that unnecessary buys of new furniture will be made. Quite often the furniture needs repairing of a minor nature only, and one company has gone so far as to make up new tops covered with battleship linoleum for desks which are too badly gone for refinishing. These tops are quite presentable and can be made up for about one-fifth of the original cost of the desk.

In the event that the tops of the desks are in a fairly good condition, the desks can be thoroughly cleaned and the worn pieces can be filled with a wood filler colored to match the old finish. The desk can then be completely varnished or can be sprayed with lacquer by means of an air brush. It has been found that the use of lacquer for the refinishing of office furniture is much more desirable than a varnishing process. By the use of lacquer, which dries very quickly, the desk can be returned after refinishing on the same day on which it is delivered to the shop. Lacquer has also been found to be considerably more durable than varnish.

Drawers which do not slide properly are among the most common of troubles with office furniture, and this, of course, is a comparatively simple matter to repair, as in most cases it is simply a case of using a plane.

It is advisable for a shop to carry a good supply of high-grade casters, as in the very great majority of cases the furniture when received from the manufacturer does not have a caster which is of sufficiently good quality to give very long life.

Leather upholstering on chairs frequently requires repair, and, in fact, it is very often necessary to reupholster the chair. It will be found in connection with the repair of a chair that a leather dressing applied occasionally will prevent the upholstering from getting brittle and checking.

Wooden letter files are an item of furniture on which it is felt that not very much time or expense should be expended, as unless the repairs are comparatively minor, it would be a paying proposition to replace them with metal files in most cases.

One of the elements which is of prime importance in the repair of office furniture is that of time. Any utility which has its own shop equipped to repair furniture can accomplish this in about one-fourth the time required if the furniture had to be sent to an outside agency, repaired and returned by them, and this feature constitutes a great saving in time and prevents inconvenience to employees whose work would be interrupted during the repair. One utility kept a record of the relative costs simply from a money standpoint of the two options which a utility has, and found that the saving which can be secured through the repair of office furniture in connection with a shop for building maintenance is quite an appreciable item.

A well-equipped carpenter shop, which can be used also in connection with building maintenance, might well contain such articles of equipment as an air brush for lacquering, a circular power driven saw, jointer, band saw, a drill press or lathe, a buffing wheel used in connection with an emery wheel, etc. All of these articles of equipment, which are necessary in the repair of office furniture and equipment, are found very useful in the care and maintenance of a modern office building, and it would be readily found that the possession of such pieces of equipment will show a saving which is easily reconcilable with their initial cost and maintenance.

Hardware, Line

It requires adequate handling facilities and good judgment to properly inspect and pass upon the numerous items of line hardware which come back for credit. Braces, brackets, pins and bolts are the most common items to be handled. It is recommended that the reconditioning be done at a salvage headquarters rather than at a number of warehouses. In the ordinary routine of storekeeping it will be up to the various storekeepers to sort out the portion of returned hardware which is fit to be put back into stock, but even this operation should be periodically checked up by the salvage man to insure that no inferior material is being picked out. As a matter of policy no storekeeper should be allowed to junk any hardware regardless of its condition. This decision should rest with the salvage man alone.

Upon receipt of hardware at salvage headquarters, the salvage organization should first sort it over and scrap that part which is obviously unfit for further service.

Some of the cross-arm braces need only straightening, which can be done most successfully under a power hammer. Others need regalvanizing also, but this should be done only if the cost is well under the cost of new braces.

The bolts frequently have the threads slightly burred and can be reconditioned by having a nut or a die run over them. Regalvanizing of bolts is not recommended unless both cost and workmanship make it desirable.

All hardware that is discolored by the weather should be cleaned by immersion in some satisfactory solution before being re-issued. This will not add to its future life, but will improve its appearance, and should be adopted as part of the salvage policy.

The salvage man and the company engineers in charge of line construction and maintenance should be thoroughly in accord as to reclaimed material. The former should not attempt to make a big showing by causing a large amount of really inferior material to get back on the company lines, and the latter should be reasonable to the point of accepting material which is suitable for further use.

Lamps, Incandescent

Companies which furnish free renewals are confronted with the problem of handling and disposing of the old burned-out lamps. Most companies insist on destroying these lamps so that they cannot be put to improper use. One company uses a small rock crusher which smashes the lamps and the bases, afterward using a motor-driven sifter to reclaim the bases, which are a good quality of light yellow brass.

Lumber

The extent to which it is economical to salvage second-hand lumber is a debatable question. Whatever methods are decided upon usually have to be applied at the source. The reason for this is obvious, as lumber is very easily damaged and unless care is exercised in removing it from service it will be rendered useless. Heavy timbers are in demand at all times in short lengths for cribbing, blocking, etc. Reclaimed lumber will make satisfactory crates, boxes, etc., if it is not in condition to be used again for building purposes.

Metals, Ferrous

The degree to which ferrous scrap should be sorted and graded is a question which calls for an intimate knowledge of the metals themselves, their handling costs and local conditions. One extreme is to sell it all in mixed lots and the other is to separate it into all of the classes provided in the commonly used scrap classifications. Most companies compromise by grading large lots only and selling the balance as mixed lots.

In utilities operating over large territories it is questionable whether it would pay to concentrate the ferrous scrap at a central location on account of the transportation costs, and there are not usually facilities at the source for grading and storing it. The sorting of ferrous scrap so as to get the highest return calls for experienced help, otherwise there will be numerous rejections and controversies with the buyers. Local conditions and company policy govern this matter to a great extent, and it will merit review at a later date.

Metals, Non-Ferrous

The greatest values in junk materials lie in this general class. These metals are used in electrical and mechanical equipment of all kinds, and its reclamation from junk apparatus is a real problem.

The simplest form of reclamation consists of segregating and grading those items which are composed of one metal only and are ready for sale in the same condition they were received from the jobs. Copper, brass, lead, aluminum, etc., are the principal metals referred to.

The great majority of electrical and mechanical equipment is composed of combinations of different metals and other substances, each one presenting a different problem of reclamation. Some of the assemblies can be dismantled economically with simple tools like a hammer, a screwdriver, or a wrench, and such work, if under competent supervision, presents no particular problem.

In addition to the two classes mentioned above, we have those which require special equipment in order to reclaim the component metals and put them in marketable condition, such as will command the highest market prices.

The principal items in this third class are insulated wires and lead-covered cables. As far as is known there is no satisfactory mechanical means of removing the weatherproof covering from wire. Machines are in use and have been described in previous reports which will cut the lead sheath from cables, and also in successive operations will cut the insulation from the conductors, but neither the speed of operation or operating costs have proved satisfactory.

The one practical method of reclamation of wire is by fire. Wire may be burned in the open where local conditions will permit, but this is not possible in most cases. Several companies are reclaiming the metals in wires and cables by the use of furnaces, one of which is described and illustrated in this review.

Besides wires and cables there are combinations too numerous to mention, some of which require study as to whether it pays to make a separation, but it will be found that it usually pays if the salvage department has trained men and proper equipment.

In all the work of preparation of non-ferrous metals for sale it should be kept in mind that the highest possible grading should be attained if consistent with preparation costs. As an example of this, one company has found additional customers for copper by sorting it as requested by certain factories, and in no case has the extra labor in preparation been a noticeable item.

Oil, Automobile

Crank case oil drained from cars may be reclaimed by oil separators which remove the objectionable liquids and solids. This work must be done well as the damage that might be done by inferior motor oil is too well known to need explanation here.

Oil, Transformer and Switch

The cleaning and drying of transformer oil in the field as a routine matter should not be considered as a salvage operation, but rather as a detail of electrical operation.* It does become a matter for the salvage organization, however, when dirty oil is removed from electrical apparatus and replaced with new oil, and the former is returned for disposition. All returned oil should be inspected, cleaned and tested before being re-issued. It should be needless to emphasize the need for avoiding the mixing of the various grades of oil, and close cooperation is necessary between the salvage organization and the using departments from the time the dirty oil is removed in the field until it is put back into use.

Paper

The qualities of paper used by public utilities are so numerous that the grading of scrap paper is not recommended, except in special cases.

It has been demonstrated that, unless rigid methods are adopted in the saving and collection of paper, a large proportion of it will be wasted. Proper receptacles must be provided, and mechanical balers should be used where it seems advisable. Regular collection and sale should be provided for to keep the paper cleaned up, and it will be found that the increased revenue will be well worth the effort.

Pipe, Iron

Every utility uses a considerable amount of iron pipe, and scrap pipe is an important salvage item. It should, in every case, be brought into the salvage department for inspection to determine its condition and final disposition.

The salvage department may employ a pipe machine to good advantage, cutting off the old threads or damaged pieces, re-threading, and coupling the pipe to standard lengths.

---

*See "Storage, Handling, Inspection and Testing of Insulating Oils," (Publication No. 289-48), Serial Report, Electrical Apparatus Committee, N. E. L. A.

Nipples may be manufactured out of scrap pipe not needed for other purposes, but it is hard to compete in this respect with modern factory machinery. This work could be done to good advantage, however, on time which would otherwise be wasted.

Since the general tendency is to make up pipe railings by welding rather than use railing fittings, practically all scrap pipe of railing sizes can be used up to good advantage.

Poles, Wooden

It is difficult to find a market for old wooden poles which are not good enough for further use as poles or guy stubs. There is a certain demand each year for a small number of poles from various sources, such as rural telephone companies, but to most companies of any size the disposition of the poles is a real problem. They must be picked up from the streets and highways from which they are removed, and many companies are compelled to sell them or give them away for firewood. One company has the poles sawed to 4 ft. lengths and burns the pieces in a special boiler to heat a large warehouse and garage.

Rags, Wiping

The collection and laundering of wiping rags has been tried by several companies with varying success. The work can be done by their own equipment or by outside laundries at a satisfactory cost. One thing, however, is clearly apparent—the rags must be of a good size and quality to stand several trips to the laundry. Proper receptacles must be provided for dirty rags, and the using departments must cooperate to prevent their loss.

Steel, Structural

Angles, channels and various shapes of structural steel are always in demand. There is, however, a feeling among engineers and construction men that the average piece of second-hand structure is too expensive when prepared for further use, and this is probably true if the steel comes to them direct from the job. Where a salvage department is maintained, it is well worth while to remove various appendages so that the steel may be handed out again clean and ready for use. Through cooperation a steady market for this class of scrap may be found, and that part which cannot be used again may be disposed of without delay.

Tools

Tools of various kinds can be economically repaired at a central point equipped for such work. While most using departments maintain facilities to make minor repairs and adjustments, there is no doubt that a great many tools from various parts of the company are discarded rather than be reconditioned. This is due to lack of supervision, lack of facilities, or a lack of knowledge of values and a salvage man will find many chances for savings in this field.

Torches and firepots are generally badly misused in the field, and it is well worth while for companies using these in large numbers to adjust and repair them instead of returning them to the factory. This puts them back into service quicker, and incidentally a campaign of education among the users would result in less abuse of these tools.

One public utility, on account of the lack of information as to just how much saving was involved in the reconditioning of tools, conducted a three months' test in one division of the company, which was of average size, during which period of time no tools were allowed to be thrown away under any circumstances. Very careful records were kept of the tools repaired, the cost new, the cost of repair, and the saving secured. Table I gives the results of this survey.

TABLE I

ANALYSIS OF COST OF RECONDITIONED MATERIAL

Name and Item	Cost New			Cost of Repair Saving			
	No.	Each	Total	Labor	Material	Total	Saving
Standard earth augers	6	$7.50	$45.00	$1.80	0	$1.80	$43.20

Salvage Furnace

It will be of interest to salvage men generally to learn that one of our member companies has succeeded in developing a salvage furnace in which weatherproof wire, lead-covered cable, etc., can be reduced without the objectionable smoke usually producd by such an operation. Smoke of this kind is objectionable to any community, and this has in many cases compelled utilities to dispose of wire and cable just as it came from service, and sacrifice the greater return which would be possible if they removed the insulation.

Fig. 1, 2 and 3 show the general construction of the furnace. In burning weatherproof wire it is necessary to keep the oil burner in front of the checker-work going throughout the burning operation. In burning cable the oil burner is kept going only for the first five minutes and is then shut off.

In both classes of material there is a dense smoke produced in the primary combustion chamber. This smoke passes through the oil burner flame and the red-hot checker work into the secondary combustion chamber. At this point, due to the peculiar construction of the walls in the secondary chamber, the smoke, gases and a fresh supply of air are whirled around and thoroughly mixed and consumed before they leave the stack. The result is a white haze at the mouth of the stack, which not even a critical smoke inspection would classify as "smoke."

These results were reached only after months of experiment, in which almost every method of smoke prevention known to combustion engineers was tried out. These results, coupled with experiments in the field under actual working conditions, enabled the salvage engineer in charge of the work to accomplish a smokeless furnace.

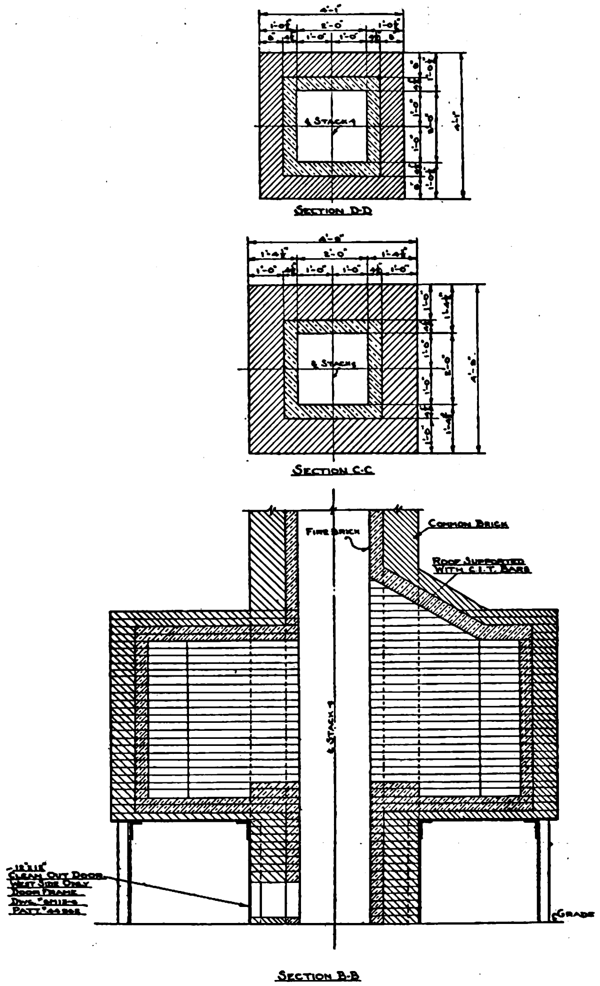

FIG. 2—LAYOUT OF INSULATION BURNING FURNACE.

METHOD OF LISTING, ADVERTISING AND SELLING

It is general practice to list the items of junk under some accepted classification and send same out for bids. Many companies have special forms for this purpose, on which all terms of sale are shown. Bargaining with junk dealers and others on mixed lots and incorrectly described materials is an undesirable method, as it makes it impossible to compare the prices obtained over a period of time. It should be needless to state that the seller should establish a reputation for accuracy in the segregation, weighing and grading of junk. This will result in broadening the market and establishing direct contact with the ultimate users instead of selling everything through junk dealers.

Salvage Materials and Equipment For Sale

The second class of salvage to be considered is that material and equipment, which cannot be classed as junk as it is still good for its originally intended uses. It may be surplus new unused material which was never applied to the jobs for which it was intended, or it may be material removed from property because of obsolescence or inadequacy. In either case it still has certain service left in it for the right parties.

Much equipment should be sold "as is" and "where is" as soon as possible after it is taken from service and listed. This is a very desirable procedure as it avoids overhead and handling charges, and should be followed whenever possible. If it is necessary to remove the equipment to the salvage headquarters, it should be explained in the listing that it is offered "as is" and that no effort has been made to recondition it.

There is some equipment that would have a market if certain work were done on it. This work may consist of repairs to remedy damage or alterations to conform to later engineering practice. It is a matter of good judgment to know how far to go in this respect also after decision is made to make repairs or alterations, it may be wise to defer the actual work until it is certain that the equipment can be sold. There should be no possibility of spending money in this work, which would afterward be wasted through inability to find a market.

It is not recommended that the salvage department develop shops capable of doing extensive repairing and alterations, as it would be more economical to have it done in the general shops of the company, if any, or by outside firms.

Salvage Materials and Equipment for Further Use

The salvaging of materials and equipment for further use within the company is a very important part of salvage work. It not only obviates the outlay of new money for the purpose, but cuts down handling and overhead expense connected with the equipment, and makes it possible to realize the property value instead of sacrificing it for sale outside the company. Unfortunately all companies are not organized to handle this matter, occasionally resulting in new purchases on which substitutions could be made.

The only sure method of handling this is to have the purchase requisitions routed through the organization in charge of salvage operations. Each requisition should be scanned by employes trained in the knowledge of what is available and the possibility of substitution. By "substitution" is not meant the supplying of a different or inferior article but simply using something already on hand instead of purchasing. The salvage organization should endeavor to sell this idea to the various departments rather than have it forced upon the latter by executive order.

As in the case of equipment for sale, any extensive repairing or altering should be deferred until there is a certainty that there will be a use for the material. Common sense and engineering knowledge will be the guide as to how much will be spent to recondition equipment for further use.

Accounting Routine and General Summary

The establishment of a definite salvage headquarters necessitates some changes in the accounting routine, because if certain conditions are imposed

FIG. 3—LAYOUT OF INSULATION BURNING FURNACE.

upon them, clerical and physical costs will rise, thereby defeating the very reasons for which a salvage department is organized. The principal condition referred to is the obligation to keep each lot of scrap separate from other lots throughout all salvage operations, in order to apply the exact return to the jobs from which it came. The proper credit may be closely estimated upon receipt of material, but thereafter the salvage department must not be obliged to keep the various lots separate. The whole accounting routine of the salvage department should be very simply set up. Costs of the various operations upon which the salvaging policies are often decided should be based upon frequent field checks rather than upon a complicated system of accounts.

It is hoped that this review, in which so much is necessarily left unsaid, will serve the purpose of stimulating interest in this important work. It is recommended that this Committee and succeeding Committees continue the review, as each year cannot fail to bring out important new phases of the work. These reviews will be of service even to those companies who, at the present time, are prevented by company policy, lack of space and equipment, or other reasons, from practising certain salvage methods. They may employ some of the methods in a modified form, and if conditions and policies should suddenly change, they would be in a position to take advantage of the experiences of other public utilities.

FILING CORPORATE DOCUMENTS

In every business there is a multiplicity of records, the preservation of which is a vital necessity in the operation of that concern. The utility business is no exception; in fact, the nature of its business requires that its corporate documents, such as franchises, rights-of-way, licenses, permits, etc., be preserved permanently to assure that utility that its future operations may continue backed by the authorizations contained in these documents.

In the smaller utilities these documents have found as their place for filing the desks and cabinets of the various executives, but as the utility has grown in size and the scope of its operations extended, the necessity has arisen for a central point for filing these documents. Such a department might properly be termed "Department of Documents," wherein information of a corporate nature will be properly indexed, safely kept and promptly available.

Equipment

Equipment necessary for the filing of documents should be selected to meet local conditions. The one essential requirement is that the documents be contained in fireproof safes and steel cabinets.

Within the fireproof safe it is desirable to have legal size compartment fittings to provide for documents which are constantly referred to and which are considered as "alive" and "active." Papers which are valuable only as history can be filed in the "Dead File," the construction of which should be of such material that their protection from ordinary uses and deterioration will be assured.

In view of the fact that the key to the department is the index cards, they should be kept in steel cabinets which will afford them the ordinary protection of office records.

Assignment of Document Numbers

Every paper assigned to the department for safekeeping will be, before it is filed, assigned a number. In assigning these numbers, it is desirable to make a preliminary survey of the papers which may be assigned for safekeeping, and assign each classification a series of numbers so that upon the receipt of a document the number, which will eventually be assigned to it, will fall within the series previously designated for that class of information.

Assuming that within a definite period of time this department will receive approximately 40,000 documents which will be assigned an individual number, the following classification is suggested:

Conveyances	1,000	to	2,500
Abstracts	2,501	to	3,000
Opinions on title	3,001	to	4,000
Leases	4,001	to	5,000
Options to purchase	5,001	to	5,200
Mortgages to or by our companies	5,201	to	5,400
Indentures	5,401	to	5,600
Purchase contracts	5,601	to	6,600
Sale contracts	6,601	to	10,300
Construction contracts	10,301	to	10,600
Crossing agreements	10,601	to	11,000
Franchises	11,001	to	11,400
Ordinances other than lighting	11,401	to	12,000
Ordinances, municipal lighting	12,001	to	13,500
Rights-of-way	13,501	to	19,000
Water rights	19,001	to	19,500
Bills of sale or assignments	19,501	to	21,000
Chattel mortgages	21,001	to	22,000
Legislative action	22,001	to	22,500
Subscriptions	22,501	to	23,000
Decisions	23,001	to	24,000
Reports	24,001	to	26,000
Releases from liability	26,001	to	27,000
Secretary of State filings	27,001	to	27,200
Bonds	27,201	to	27,500
Certificates	27,501	to	30,000
Receipts	30,001	to	31,000
Correspondence	31,001	to	32,000
Agreements re water	32,001	to	32,300
Street lighting agreements	32,301	to	32,800
Municipal power agreements	32,801	to	33,000
General agreements	33,001	to	34,000
Court proceedings	34,001	to	35,000
Company activities	35,001	to	36,000
Affidavits	36,001	to	36,200
Lists	36,201	to	36,500
Tax matters	36,501	to	37,000
Joint use agreements	37,001	to	38,000
Licenses and permits	38,001	to	38,500
Resolutions	38,501	to	39,000
Blue prints or surveys	39,001	to	39,400
Notices	39,401	to	39,600

Indexing of Documents

In view of the fact that a document is assigned a number upon its receipt for filing, all identification of that document as to its name or contents is lost, except by reference to the index.

The indexing of documents may be according to the names of the parties concerned, locations of the property affected, the commodity sold or purchased, or may be indexed wholly according to general subject matter.

NAMES may be divided into individuals outside of the organization, may be corporations or the personnel of the parent organization and corporations acquired by or subsidiary to it.

LOCATIONS may be by section, township and range in rural territory; by street, avenue, boulevard, drive or place, or additions and subdivisions in cities, towns and counties; may involve lode or placer mining claims, ditches or reservoirs.

COMPANY HOLDINGS may be a generating plant, substation, office building or warehouse.

COMMODITY OR GENERAL SUBJECT may be contracts for the purchase of coal, meters, transformers or for tree trimming or highway lighting.

As an example for the above classification let us prepare the filing ticket for the warranty deed from John Jones, dated March 6, 1926, to the Electric Light & Power Company for the five acres in SE¼, Sec. 24, Township 3 So., Range 31 West, Davis County, site of Sparta Substation, all being part of the property acquired by purchase.

Publication No. 289-63, Serial Report, General Records Committee.

298

CONVEYANCES

Warranty deed from *John Jones,* March 6, 1926, to *Electric Light and Power Company* for five acres in *SE¼ Sec. 24, Township 3 So., Range 31 West,* Davis County; site of *Sparta Substation.*

FIG. 1—INDEX CARD.

1 9 4 8

JULY* 10*th

Canton Franchise expires July 10, 1948. See Document 11804. Notify Vice-President in charge of Districts and District Manager.

FIG. 2—TICKLER CARD.

Each set of the underlined words heads a card with the number in the upper left-hand corner and containing the above information.

The master card reading "298—Conveyances" goes into the compartment indexed "Classification of Documents," and is checked against the last preceding card, which should be 297; when the paper itself is put in the safe it is also checked against the one last preceding, 297, thus providing two opportunities to detect error in filing.

The card "298—John Jones" goes into the compartment "Individuals and Corporations," minutely alphabetically divided; the next "298—Electric Light & Power Company" in the compartment "Our Companies and Officials"; the next "298—Range 31 West, Township 3 So., SE¼, Sec. 24" goes into the compartment "Range, Township and Section." The next card "298—Sparta Substation" goes into "Company Holdings" with a guide containing this name.

Thus indexed, no matter how asked for, whether by name of grantor, location by section, township or range, by name of the holding specifically or the property generally, it can be found. Inquiries for information contained in these documents or for the actual documents themselves may come from persons not directly connected with the company as well as its officers and employees.

Tickler Card System

If a document has been properly numbered and indexed according to the above procedure, there may be some particular subject matter about which it is desired to call to someone's attention at some future date. Franchises, leases, options, contracts, chattel mortgages, State and Federal licenses have definite expiration dates, sometimes fifty years in the future. Sufficiently in advance of the expiration dates notices should be sent to specific persons that payment should be made or some action should be taken; therefore, the necessity arises for a tickler card system.

As an example of this, let us assume that the Canton Franchise expires July 10, 1948. At the same time that the document is indexed and filed, a tickler card is made up. (See Fig. 2.)

Similar cards are made for Jan. 10, April 10 and June 10, 1948, respectively six months, three months, and thirty days in advance, and these filed under the year 1948 in a compartment divided by years. The present and next succeeding year's tickler cards are divided by months; the current three months divided by days, and to these notices are sent out each week or ten days for the items of the next succeeding ten days. As the compartments are emptied, the thirty-day dividers are moved back for the fourth next succeeding month. As time passes, the cards for the current period will come to the front, at which time the necessary action is taken to fulfill the requirements in the document.

Routine Payments

Leases for the offices, warehouses, pole-yards, retainers fees for legal and medical services, etc., and all requiring regular payments are on file. A record of these payments is kept in such a manner that by daily reference to this record the regular payments are not overlooked. Voucher requests for these are made sufficiently in advance so that payment may be made as scheduled. Yearly payments to the railroads on crossing and right-of-way agreements, franchise taxes to communities, rentals to the state and departments of the United States are made regularly. From this department the requests are forwarded to the department head concerned for his approval, after which they are sent to the Accounting Department for payment.

Chattel Mortgages

In some utilities the sale of merchandise on a time payment basis is carried on quite extensively. In these cases it quite frequently develops that it is desirable to place a chattel mortgage on the larger appliances sold.

The proper place for filing these mortgages after they have been recorded is in this department. As soon as they are received and indexed, a tickler card is made up which calls to the department's attention at the proper time that the chattel will expire within thirty days. When this tickler card comes to the front of the file, which is thirty days previous to the expiration of the chattel mortgage, a notice is sent to all parties concerned that the account should be paid in full by a certain date and requesting advice as to the status of the account. If the account has been paid in full a notation to that effect is made and a release is issued; if the account has not been cleared up and it is deemed advisable, an extension is filed. The follow-up procedure on the extension is the same as outlined for the original chattel.

Receipts for Loaned Documents

During the course of the company operations the necessity develops for the temporary removal from the files of certain documents.

Receipt cards showing document number and date taken are made up for all those taken out, the receipt immediately taking the place of the absent paper so that later inquiries may be directed to the party holding same. In this manner, then, the paper when once received by the department for filing is kept close track of and the chances for its loss or misplacement are slight.

A procedure of this nature provides a complete record of important transactions from their origin to their consummation. Of such importance is this department that it is desirable to install as its head an employee with legal training. In view of the fact that a number of the contracts and other important documents originate in this department it is important that its chief be qualified to draw up contracts, properly approve contracts which have been received for filing, and be conversant with the important points in various documents so that the company will be fully protected in its operations and activities in accordance with the provisions contained therein.

DIESEL ENGINE POWER COSTS

The subcommittee on Diesel Engine Power Costs published its first serial report (Publication No. 267-97) in September, 1927. It is the intention of the subcommittee to publish a similar report each year, which will contain data and information collected during the previous twelve months. The present report represents the second serial report on this subject.

Scope of Report

The Serial Report on Diesel Oil Engine Power Costs (Publication No. 267-97), which was published in September, 1927, presented operating data on a large number of plants located in this country and England. The report outlined rather completely a method of determining the costs of generating power with Diesel oil engines by applying the data recorded for these plants. It is, therefore, unnecessary to outline this method in this report. The information presented in this report on operating data and investment costs should be considered as supplemental to the information published in the 1927 report.

In this report are presented operating data and investment costs on a number of plants which have been obtained since the publication of the 1927 re-

TABLE I

OPERATING DATA AND UNIT COSTS OF DIESEL OIL ENGINE GENERATING PLANTS

*See page 17, Report on Heavy-Oil Engine Working Costs (1923-24) and Reports for 1924-25, 1925-26, and 1926-27.

†Includes one 500 b.h.p. Semi-Diesel Engine.

‡Includes one Semi-Diesel Engine.

§Data obtained from 1925-26 Report only.

NOTE

Output, peak load, and load factors are for year 1926-27 only, except for plants marked (§).

Average age of engines—8.1 years.

Auxiliaries require approximately 3.0 per cent of energy generated.

3,810 kw. of capacity listed in table was installed during last year.

B.t.u. of fuel—approximately 19,000 to 19,500.

Plants Nos. 45 to 55 inclusive and 44-26 are overseas stations.

port. The last annual report of the Diesel Engine Users Association of England on Heavy Oil-Engine Working Costs (1926-27) has been abstracted and included in this report.

In the 1927 report data were given only for Diesel engine generating plants. In this report data are presented for a number of installations where the engines are connected mechanically to their loads. Investment costs for five of these installations are included in the report.

Operating Data

In Table I are given the operating results of 23 Diesel engine generating plants, having a total installed capacity of 25,000 b.h.p. and having a total annual output of 46,000,000 kw-hr.

Plants J and T of this table also appeared in last year's report. The data for these two plants in this report cover two years of operation instead of one year, as given in the 1927 report.

The data in this table, together with that appearing in Table I of the 1927 report, represent the operating results of 65 plants, having an installed capacity of 82,000 b.h.p. and an annual output of 190,000,000 kw-hr. These plants are all located in the United States.

In Table II are given the operating data of 44 plants recorded in the report of the Diesel Engine Users Association of England in its report on Heavy Oil-Engine Working Costs (1926-27). This table is similar to Table II in Publication No. 267-97, except that for most of the plants it covers five years of operation instead of four. In preparing Table II this year, all plants containing ex-submarine engines were omitted, as it was felt that these units do not represent the performance to be expected from engines designed for stationary service. Maintenance and miscellaneous cost items for all "overseas" plants have also been omitted. The table gives the results for 44 plants having an installed capacity of 39,000 kw. and an annual output of 60,000,000 kw-hr.

Table I of the 1927 report, together with Tables I and II of this report, present operating data on 109 generating plants, having a total installed capacity of 140,000 b.h.p. and an annual output of 250,000,000 kw-hr. Table III of the 1927 report shows data on 15 additional plants having an annual output of 24,000,000 kw-hr.

With this amount of data available, it is evident that values taken from the results of these 124 generating plants represent a fairly reasonable picture of what may be expected from the average Diesel engine generating plant.

Fuel Oil Consumption

In Tables I and II the fuel oil consumption for the 61 plants reporting this item varies from 0.618 lb. per kw-hr. to 0.937 lb. per kw-hr. In Table III the variation for the 15 mechanical-drive plants is from 0.668 lb. per kw-hr. to 1.660 lb. per kw-hr., a considerably higher variation than that of the generating plants.

TABLE III

OPERATING DATA OF MECHANICAL-DRIVE DIESEL ENGINE INSTALLATIONS

V—Taken from operator's records.

As pointed out in the 1927 report, consideration to the actual load conditions should be given before estimating the fuel consumption for a proposed plant.

Lubricating Oil Consumption

The 58 plants reporting lubricating oil consumption in Tables I and II show a variation in this item of from 252 kw-hr. per gal. to 1730 kw-hr. per gal. From an inspection of these data, it is apparent that the estimates in the 1927 report for this item are better than average performance.

Miscellaneous Supplies, Including Cooling Water

From Tables I, II and III it is apparent that the average cost for miscellaneous supplies, including cooling water, varies greatly between installations. The value of this item for any one installation depends upon a large number of factors, many of which depend upon the location of the plant.

Maintenance

In the 1927 report it was pointed out that maintenance costs are more nearly proportional to output than to initial investment. For this reason maintenance costs have been reported again this year in mills per kw-hr.

In Tables I and II of this report this item varies from 0.34 mills per kw-hr. to 9.82 mills per kw-hr.

In Table III of this report the variation for the mechanical-drive installations is from 0.41 mills per kw-hr. to 5.67 mills per kw-hr. We may safely assume from experience that in a generating plant about 90 per cent of the total maintenance cost is chargeable to the Diesel engine itself.

Attendance Labor

As was indicated in the 1927 report, the amount of attendance labor required in an oil engine plant varies considerably, depending upon conditions. It remains a fact, however, that experience has shown that competent labor must be employed if maintenance costs are to remain at a normal figure.

An inspection of the labor costs for 22 Diesel engine plants, the majority of which were operated by utility companies, shows a variation from 0.93 mills per kw-hr. to 16 mills per kw-hr. These data are shown in Table VI. These plants range in size from 165 b.h.p. to 3450 b.h.p.

For the purposes of determining total power costs the estimates of attendance labor given in the 1927 report are conservative.

Plant Investment

Tables IV and V show investment costs of Diesel engine installations. Table IV includes only generating plants, while Table V includes only mechanical-drive installations. In determining the investment required for a Diesel engine plant, it is important to remember that this should include an adequate building with facilities for repairing the units and sufficient auxiliaries so that there is a minimum possibilty of service interruption. Many estimated investment costs neglect to include these important items.

TABLE V

INVESTMENT COSTS OF MECHANICAL-DRIVE DIESEL ENGINE INSTALLATIONS

Reference No. of Plant	Installations				Total Investment	Investment per Installed H. P.

REFERENCE

J to R-1 inclusive, see Table I.

A-2 to J-2 inclusive, 1925 Report of Sub-Committee on Diesel Engines of Great Lakes Division, N. E. L. A., page 11.

S—Taken from operator's records.

In Table IV are the investment costs of eight plants, six of which have been constructed within the past three years. If the data of this table are combined with that of Table IV of the 1927 report, the following median values are obtained:

MEDIAN VALUE OF UNIT INVESTMENT

No. of Plant	Per B.h.p.	Per Kw.	Remarks
13	$145.00	$208.00	Building included
3	102.00	152.00	Building not included
6	121.00	194.00	Not known if building is included.

Plants H and K-7 of the 1927 report and O, P, R, T and V of this report have been constructed during the past three years and the costs include buildings. The median values for these seven plants are $150.00 per b.h.p. and $210.00 per kw. These data indicate very clearly that the investment estimates given in the 1927 report are low and in most cases should be increased.

Table V gives the investment costs of five mechanical drive installations installed approximately five years ago. The median value checks fairly well with the data obtained for the generating plants when the time of construction is considered.

An investment estimate made in April, 1928, by one of the engine manufacturers for a 1050 kw. plant shows a cost of $131.00 per kw. and does not include the following items: Building and crane, real estate, fuel tanks and piping, foundations, common labor for erecting, cooling tower, interest during construction, engineering and overhead, including accounting, insurance and stores expense. When these items are added to the above figure, it is evident that the total cost of the complete plant will be around $200.00 per kw.

On page 350 of "Diesel and Oil Engineering Handbook" by Julius Rosbloom, the investment cost of a 500 b.h.p. Diesel plant consisting of one unit is given as $65,000.00. This represents a unit investment cost $130.00 per b.h.p., or $195.00 per kw., if proper allowance is made for generator efficiency. This includes a building and installation cost, but evidently does not include the cost of a generator, switchboard and wiring.

The following table, which appeared on page 932 of *Power Plant Engineering* for Sept. 1, 1927, gives the investment charges on a 600 b.h.p. plant erected in 1926. The plant contained two solid injection engines of 240 and 360 b.h.p. direct-connected to alternating-current generators.

INVESTMENT CHARGES ON A 600 B.H.P. PLANT

	Cost	Cost per Kw.
Engine 240 h.p. and 200 kv-a. generator.	$15,510.00	$97.00
Engine 360 h.p. and 300 kv-a. generator.	21,795.13	90.70
Building, foundations, cooling tower and fuel oil tank piers	18,099.35	40.25
Pipe, pipe fittings	5,772.10	14.41
Electrical material	6,252.34	15.62
Miscellaneous material	296.88	.74
Auxiliaries (pumps, compressors, etc.)	2,934.86	7.42
Transportation (freight and express)	642.74	1.60
Stores and storekeeping	520.40	1.30
Labor	5,537.00	13.82
Insurance on labor	376.96	.94
Interest during construction	1,230.26	3.08
General engineering and accounting	3,128.66	7.82
Overhead	5,819.54	14.52
Real estate	2,000.00	5.00
Total cost	$89,916.33	$223.00

In determining the investment cost of a particular plant, care should be taken that sufficient capacity is installed to adequately handle the load. The committee has had a number of Diesel plant layouts brought to its attention, in which not only was there no spare capacity provided, but the total installed capacity of the engines was less than the maximum demand of the load. Good engineering and economic considerations should dictate the installation of a plant slightly larger than actually required rather than one slightly smaller.

On page 3 of the serial report of the Prime Movers Subcommittee on Oil and Gas Engines, published in March, 1927 (Publication No. 267-24) is given a valuable discussion of investment costs. This discussion also appears on page 894 of the N. E. L. A. Proceedings for 1927 and should be read by those who wish to obtain reliable engineering and construction cost data on Diesel engine plants.

FIG. 1.—SHORT FORM OF QUESTIONNAIRE.

Sources of Data

The committee is indebted to those who have made possible the publication of the data contained in this report. Data have been received from privately owned utilities, municipally owned utilities, manufacturing plants and Diesel engine manufacturers. During the coming year it is hoped that the committee will receive the same cooperation from these various sources of data.

The questionnaires prepared in 1926 for use by the committee and published in the 1927 report were found to require considerable time and effort to complete. A shorter form has been devised and is printed in the Appendix as part of this report. This new form has been found very satisfactory and will be used by the committee whenever it is impracticable to use the longer form.

The committee urges all power sales engineers to report both operating data and investment costs for Diesel plants located in their territories. The form printed in this report as Fig. 1 may be used for this purpose, or additional copies may be obtained from the Chairman of the Power Committee.

LIGHTING SERVICE MANUAL—PART III

TEST SPECIFICATIONS

Introductory

This work was undertaken because of the general feeling that tests on diffusing glassware as commonly presented, made on only one sample, were not as representative of the product as they might be. It was felt that without unreasonable increase in cost, the manufacturers could present tests which would be comparative and, therefore, of more value to the engineers in the field. The chairman of this subcommittee was appointed from the Lighting Service Committee to assemble a committee for the purpose of studying the situation and recommending a standard procedure for testing. The original committee consisted of Messrs. Little, Keller and Fisher. Others were added from time to time as the committee's work expanded.

It was the original intention that this committee should first prepare testing specifications for diffusing glassware and then should go into the field of floodlight projectors and asymmetric reflectors for show window and billboard lighting if it seemed desirable to do so. The committee would have been unable to complete more than the procedure for glassware had it not been for the official action of the Association of Railway Electrical Engineers, who turned over to the Illuminating Engineering Society the work they had already accomplished through a subcommittee of their Committee on Illumination. L. S. Billau, Baltimore & Ohio Railroad, chairman, in drafting a procedure for testing floodlight projectors, with the request that the Illuminating Engineering Society continue this work. The personnel of the A. R. E. E. Subcommittee, consisting of Messrs Burnap (chairman), Beggs (replacing K. S. Weaver), Benford, Harrison and Little, was at once made a part of this subcommittee, with the result that we are able to present in this report a procedure for the testing of floodlight projectors which is, in principle, the same as that adopted by the Association of Railway Electrical Engineers.

The subject of the testing of asymmetric reflectors was taken up so late in the year and proved to be so difficult of solution that the committee has decided not to include even a suggested procedure in this report. It is recognized that the application of this type of reflector has, by custom, become a "rule-of-thumb" matter. It is also foreseen that any test which will give a fairly complete picture of the light distribution from such a reflector will be relatively high in cost. That such reports are desirable seems to be generally admitted, but there is no general agreement as to how elaborate or expensive a test is justified.

Several applicable methods have been published, namely: "Isocandles and the Asymmetric Lighting Unit," by F. A. Benford, *General Electric Review,* April, 1925; the "Use of Rousseau Diagram," by K. S. Weaver, *Transactions, I. E. S.,* May, 1927, and the "Efficiency of Asymmetric Light Sources" (Fluxolite Paper), by A. A. Wohlauer, *Transactions, I. E. S.,* May, 1928. A fourth method which proposes to record readings on a cylindrical surface has been proposed by R. S. Burnap.

The committee recommends that the study of this subject be continued, and that if practicable a standard testing procedure be developed.

Specifications for Testing Diffusing Type Inclosing Glassware

A—General

1. The specifications shall apply to all luminaires whose design includes a globe of diffusing glass which, together with its fitter, incloses the light source entirely, or nearly so. The use to which the luminaire is to be put makes no difference. This classification includes such luminaires as the "Glassteel," and enameled semi-indirect inclosing globes as well as ordinary inclosing globes, but does not include prismatic inclosing globes.

2. Testing shall be done by an impartial laboratory and the selection of globes for test shall be made or supervised by an impartial observer, either a representative of the laboratory or one selected by the laboratory. The report shall state by whom the selection was made.

3. A report of test made according to these specifications shall be plainly marked, "Tested according to I. E. S. Standard Specifications" and the laboratory by its signature certifies to this as well as to the correctness of the data.

B—Selection

1. If possible, at least 25 samples of one size (preferably the 200 watt) shall be selected at random as passed by the factory inspector, and weighed. The report shall state what percentage of those available were examined and weighed. From this lot six shall be selected, one representing the maximum, one the minimum, and four as nearly as possible the mean weight, and, as far as visual inspection can go, a fair sample of the product.

2. In case of breakage prior to test of any globe a single replacement sample of approximately the same weight shall be acceptable.

C—Physical Measurements

1. For each of the six samples the report shall include the weight in ounces.

2. For the single globe used for candle power and brightness tests the report shall include:

a. The overall diameter, (f).
b. The overall depth, (e).
c. Maximum diameter of neck, (h), see Fig. 1.

---

* Publication No. 289-5, Serial Report, Lighting Service Committee.

D—Output

1. The lumen output for each of the six samples shall be measured in a sphere, or by equivalent method, and all six values shall be given in the report.

E—Candle Power Distribution

1. The report shall show for the luminaire of *mean output* and for the bare lamp used in the test, by a polar curve, the candle-power values at 0 deg., 90 deg. and 180 deg. from the nadir and at intervals of 10 deg., beginning at 5 deg. and ending at 175 deg., with the luminaire rotating, at a distance of at least 10 ft. The candle-power values for all points shall also be shown in tabular form for the luminaire, but not necessarily for the bare lamp.

2. Zonal lumens shall be given for the lamp alone, and for the luminaire for every 10 deg. zone, beginning with the zone 0 deg.—10 deg. These values shall also be summarized for zones 0 deg.—60 deg., 0 deg.—90 deg., 90 deg.—180 deg. and 0 deg.—180 deg. For each of these four zones the lumen output of the luminaire shall be expressed as a percentage of the total lumens of the bare lamp. The 0 deg.—180 deg. value represents the efficiency of the luminaire.

3. The tabulated values and curves shall be on the basis of the *rated* lumens for the lamp used as given by the lamp manufacturer.

4. The test lamp shall be selected to be a well-constructed lamp of standard type, and the correct size shall be determined according to the following table, unless otherwise specified by the manufacturer, in which case it shall be reported as an exception:

Diameter of Globe	*Wattage Rating of Lamp*
Under 10½"	100 (inside frost)
Over 10½ to 12½"	150 (clear)
Over 12½ to 15½"	200 (clear)
Over 15½ to 17½"	300 (clear)
Over 17½ to 20"	500 (clear)
Over 20"	1000 (clear)

5. If the globe is publicly and regularly sold or recommended by the manufacturer to be used with a particular fitter or type of fitter, it shall be sc tested and the characteristics of the fitter noted, but if not so recommended, it shall be tested under the following conditions. The manufacturer shall submit to the laboratory his publicity material for verification.

a. The globe opening shall be covered by a material having a neutral tint, a matte surface and a reflection factor of 30 — 40 per cent. The report shall state the value of the reflection factor. No other reflection factor is acceptable, except as noted above.

b. The cap-contact position (i. e., the distance from the cap-contact of the lamp to the plane of the fitter screws, d, in the diagram) shall be 1½ in. for the 4 in. fitter, 2 in. for the 6 in. fitter and 3 in. for the 8 in. fitter, and for all mogul base lamps, unless some other position is specified by the manufacturer of the globe and stated in the report.

6. The report shall contain a prominent note to the effect that the test results are reproducible only if the conditions of test, especially the light-center position, are maintained in use.

F—Brightness

1. The test shall include and the report shall show brightness values expressed in candle-power-per-sqare-inch for the luminaire of ***mean output*** at the points described as follows and shown on the diagram by corresponding capital letters:

a. With the photometer pointed as nearly as possible tangent to the luminaire in the horizontal plane passing through the light source.

b. With the photometer pointed toward the light source in the same horizontal plane.

c. With the photometer pointed horizontally, as nearly as possible tangent to the bottom of the luminaire.

d. With the photometer pointed horizontally, in a vertical plane through the luminaire axis, toward the brightest part of the upper third of the luminaire.

e. With the photometer pointed at 45 deg. from the nadir in a vertical plane through the luminaire axis toward the brightest spot visible when the globe is viewed in a direction approximately 45 deg. from the nadir.

f. With the photometer pointed vertically, parallel to the luminaire axis, toward the circumference where the horizontal plane through the light source intersects the globe.

g. With the photometer pointed vertically along the luminaire axis, offset, if necessary, to avoid an opening in the globe.

h. With the photometer pointed vertically, parallel to the luminaire axis, halfway between positions G and F.

i. With the photometer pointed horizontally, in the vertical plane through the luminaire axis, toward the same point defined as E.

j. With the photometer pointed vertically, parallel to the luminaire axis, toward the same point defined as E.

2. For readings at points E, I and J the luminaire shall be stationary, but for all other points it shall be rotated. The photometer or diaphragm shall be so adjusted that the field of view includes as nearly as possible one square inch of projected area of the luminaire.

G—Other Data to Be Recorded

The report shall also include:

1. The trade name and maker of the globe or complete luminaire.

2. A description of the test lamp, including watts, volts, bulb, base, service, filament construction, and lumen output.

3. A cross section drawing of the globe or luminaire to scale showing dimensions and light-center position for test and points at which brightness readings are made.

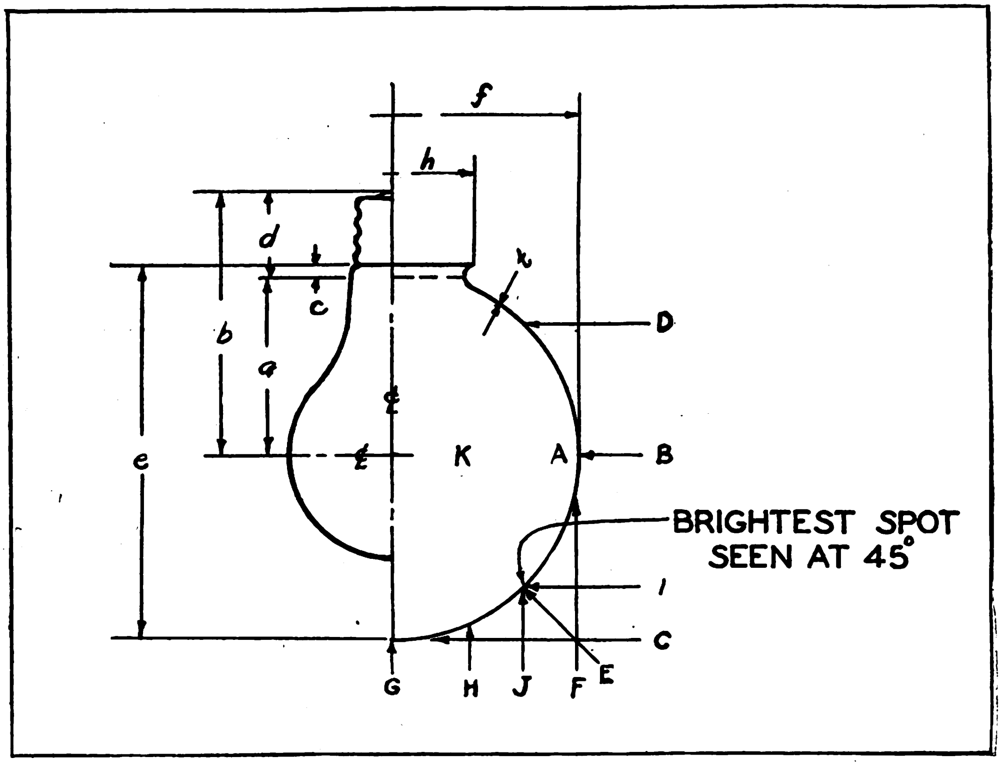

FIG. 1—SECTION DRAWING OF LUMINAIRE.

H—Remarks

1. The report shall include under the heading "Remarks" any notes not given elsewhere, which in the opinion of the testing laboratory would be pertinent in judging the globe, such as "filament visible," "spotted appearance," "exceptionally thin spots," etc.

Explanation of Specifications for Testing Diffusing Glassware and Remarks on Analysis of Tests

General

In selecting the proper inclosing globe for any lighting installation, much information can be obtained from photometric reports. A photometric report, however, means little unless it presents a clear and accurate statement of the conditions under which the test was made. Furthermore, this statement must be accurately interpreted.

To assist in the analysis of such photometric reports it has been felt necessary first to have tests made on the same basis and, second, to explain how the information contained in the report is to be interpreted.

In order to make sure that the test report can be considered on a par with others, it should first be ascertained if the report is distinctly marked, "Tested according to I. E. S. Standard Specifications." The testing laboratory which signs the report is then responsible for the conduct of the test according to these specifications. They draw no conclusions, but give information from which conclusions can be drawn. It has been thought best, upon careful consideration, to make the specifications fairly rigid and

LIGHTING GLASSWARE

Data Required

Test in compliance with I. E. S. specifications for testing commercial lighting glassware.

Selection

The selection of the six globes sent to the Laboratories was made by a Mr. ...., Engineer, representing the .... Company. The samples were selected at random from a group of twenty-five at the .... In compliance with the specifications twenty-five globes were weighed, from which six were selected representing the maximum, minimum and four of average weight. The selection was a fair sampling of the product from the standpoint of appearance. The sampling was 30 per cent of the globes available.

to allow no variation, except in the size and type of lamp to be used, and in the light-center position.

Every effort has been made to draft specifications which will be fair to both manufacturer and consumer.

Choice of Units for Testing

In the manufacture of single layer (homogeneous glass) or multi-layer (cased glass) inclosing globes, the pieces produced will vary to some extent in weight as well as in light output. This results from the fact that the manufacture of inclosing globes is still largely a manual process. We cite a case where ten 14-in. globes of one manufacture were purchased on the open market. These inclosing globes varied in weight over a 10-oz. range, while the total light output varied 8 to 12 per cent. Special globes can be made thin enough to have a high efficiency, and even in a heavy globe of homogeneous glass the weight might be so distributed that it would show a high efficiency when tested. The average globe, considered from the standpoint of performance, cannot be selected correctly by choosing a globe of the average weight of those produced.

Due to the physical characteristics of multi-layer glassware there is even stronger reason why weight cannot be the criterion for selection. A cased glass globe is formed by blowing together two or more gatherings of glass, one of clear and another of an opalescent or diffusing glass. The clear layer serves as a mechanical backing for the thin opal layer and is, therefore, necessarily thicker. The opal layer serves as a light diffusing medium and, for the sake of efficiency, is blown as thin as practicable. Two cased globes may be of the same weight and still may differ widely in output. This is due to the fact that the output of each largely depends upon the thickness of the opal layer, which, in one case, may be as much as twice as great as the other without the individual globes differing in total weights.

In view of these facts, it can be seen that merely to select a globe of average weight would not give us a fair sample, but weight does play some part. The method of selection given in the specifications is to have an impartial observer select twenty-five globes at random as they are passed by the factory inspector. These globes are then weighed and six are selected, including the heaviest, the lightest, and four, as nearly as possible, the average weight of twenty-five. If it is impossible to inspect as many as twenty-five globes, due to the fact that the run is smaller, then the inspector is authorized to select the samples from a smaller number, but in the report he is to state how many globes were inspected and what percentage of the total run was weighed. The information as to light output and brightness is obtained by the laboratory not from the globe of mean *weight* but from that of mean *output*. After all six samples have been tested, either in a sphere or by some equivalent method, the report, based on this method of selection, is generally agreed to be a fair indication as to the qualities of the product.

It has also been generally agreed that if the test is made on the 14-in. diameter globe, generally used with a 200 watt lamp, the results will fairly represent all sizes of that particular line. Globes of this size generally have an opening to fit a 6-in. fitter.

The report will show both the total light output and the weight of each of the six samples which, due to the method of selection, should give a fair picture of the variation of these two elements in the product as commercially marketed.

Candle Power Distribution and Lumen Output

In the manufacture of diffusing globes it is impossible to avoid some differences in the distribution of the glass which will cause a corresponding change in the candle-power distribution of the luminaire. It would, therefore, be ideal to take complete candle-power measurements on all six of the selected samples. We could then determine the average distribution by plotting in the report a curve representing the mean of the six individual curves. This would increase the cost of the test unreasonably and, for practical purposes, the result would be very little, if any, better than the curve which will be obtained from the globe giving the nearest to the average total output. These output measurements are made in a sphere or by some other integrating method which can be done more quickly and at much less cost.

In analyzing the distribution it should be borne in mind that the lumen output in the 0 deg.—60 deg. zone is most effective in putting light on the working plane, except in the case where the principal plane to be illuminated is vertical, in which case the most effective lumens are those in the zone 60 deg.—90 deg. The principal glare zone lies probably between 60 deg. and 85 deg., which is not shown specifically in the report. However, the lumens in this or any other zone can be obtained by adding those which occur in the 10 deg. zones included in the larger zone. The light emitted in the 90 deg.—180 deg. zone, of course, goes to the ceiling and upper part of the side walls from which a portion is reflected back to the working plane. The effectiveness of this portion naturally depends upon the reflection factor of the ceiling. Therefore, in comparing globes it is obviously not sufficient to compare the total output efficiency as given for the 0 deg.—180 deg. zone in per cent of the lumens of the bare lamp, but the distribution of the lumens must be analyzed with respect to the conditions under which the globe will be used.

In obtaining distribution curves it is customary to operate the test lamp at lower than its rated voltage in order to secure better control. However, the results are tabulated and plotted at the rated lumen output for the type of lamp used, either by calibrating the photometer to give these values or by correcting the results by well-established constants. A test made under these specifications will give a fair indication of the variation in total light output or efficiency for the type and make of the luminaire tested. The examination of a good many tests indicates that in general the variation will not be more than 5 per cent above or 7 per cent below the value shown in the test report.

Selection of the Test Lamp

The lamp should be a clear (inside frost for the 100 watt size) lamp selected to be as nearly as possible a perfect type of current manufacture, both in respect to mechanical construction and light output. It should be properly aged and calibrated by the laboratory. The size of lamp specified for each size of globe corresponds to good practice. It is not the intent of the committee to limit the size of lamp to be used with a given globe, but merely to standardize testing procedure. The ranges of globe sizes have been given so that as far as possible no globe will fall on the dividing line, but, even in that case, the wording of the table should be clear. If occasionally some manufacturer may feel it necessary to have his globe tested with a different size or different kind of lamp he may do so under these specifications by stating that fact plainly as an exception, so that there will be no likelihood of a comparison being made between such a test and a test made with the standard size and type of lamp.

Lamp Position and Cover for Globe Opening

Diffusing globes are submitted for test in two general classifications: Those sold by glass manufacturers on the open market for use with any type of fitter and those sold with a particular fitter. The glass manufacturer naturally wants his product to show up as well as possible and, therefore, it has been his general practice to have his globes tested with the openings covered by white blotting paper and with the light source at the position which will give the most nearly uniformly illuminated appearance to the globe. There has been no assurance that these conditions can be duplicated in practice. Some holders are finished on the inside with a reflecting material, but many are left in their natural state. Examination of quite a number shows that the average reflection factor lies between 30 and 40 per cent. The variation in output efficiency is only in the order of 6 per cent for a 6-in. fitter opening when the cover for the opening is varied from black velvet to white blotting paper. Therefore, it is felt to be a fair representation of practical conditions to cover the globe opening with a material having a matte surface, a neutral color and a reflection factor somewhere between 30 and 40 per cent.

There is no standardization among fixture manufacturers as to socket positions in their fitters. Variations have been found which change the cap-contact position of the lamp over a range of approximately two inches. The average of several fitters showed a cap-contact position of 2.08 in. (d in diagram). Therefore, two inches has been specified as the testing position for globes with 6-in. fitter openings, in the absence of definite recommendations from the manufacturer. For similar reasons the positions have been specified for other fitter sizes. It must be understood that with the present variation in fitter dimensions the actual cap-contact position of the lamp in the installation may vary an inch up or down from the specified test position unless care is used in selecting a fitter which will give this position.

It is recognized, however, that a globe of given shape will have its performance materially altered by moving the light center through this range. One test showed that a movement of one inch in the light-center position changed the total output 3 per cent. Other tests have shown changes from 2 to 10 per cent. The glass manufacturer should know and specify the light-center position, both for test and actual use, which will produce the best results with the particular globe shape in question. It is also to his interest to see that there are fitters on the market which will give this position. On the other hand, the engineer in the field in recommending an installation should make sure that the fitter he selects for use with a particular globe shape will give the light-center or cap-contact position recommended by the globe manufacturer. The glass manufacturer can certainly be depended upon to specify a light-center position which can be obtained in practice, as otherwise the report would be more or less worthless. Therefore, if the manufacturer finds no stock fitter on the market which will give the theoretically best position for the globe shape in question, he has four courses open to him, namely: (1) To have a special fitter made, or (2) to specify for test the best position given by a commercial fitter, or (3) to have the test made with the position specified as standard, which represents no particular fitter, but the average of those examined, or (4) to arbitrarily specify the theoretically best position and trust to public demand to have a fitter manufactured. It is to be hoped that all the glass manufacturers will adhere to either the first or the second course.

Perhaps the glass manufacturers and fixture manufacturers will find some working agreement leading toward standardization to the end that the best interests of both may be served.

If the globe and fitter are specially designed to fit only each other and are, therefore, sold as a complete unit, it is necessary that they be so tested in order to present a fair report of the performance. If a globe which obviously falls in this class is submitted without a fitter, it cannot be tested according to these specifications.

Brightness

Brightness readings are recognized to be quite important in the determination of relative glare. In designing a lighting installation, the engineer consciously or unconsciously determines what degree of glare can be permitted. It is impossible to say definitely whether or not certain brightnesses or certain magnitudes of candle-power in the direction of the eye will be glaring unless all of the conditions of use are known. Values of these factors which may not be glaring where there is only one unit in the room, mounted fairly high and located almost overhead, may be distinctly uncomfortable in a large room with a great many units exposed to view or where the ceiling is low or dark in color. Authorities differ as to the maximum brightness which is allowable and no very definite statements can be obtained, but it is obvious that a reduction of the candle-power in the direction of the eye or of the maximum brightness, or both, will tend to reduce glare and make the luminaire more comfortable to look at.

It is claimed by some engineers that for comfortable work in an office where artificial light is used all day long, and several units are in the field of view, the maximum brightness of the luminaire in the direction of the eye should not exceed two candle-power per square inch. In stores where the mounting height is greater and the application of the eye is not so constant or intensive, brightnesses as high as four or five candles-per-square-inch do not seem annoying under most conditions. It is to be hoped that in the future more quantitative work will be done on this subject so that more definite specifications can be given.

In the test report the brightness reading at the point "E" is intended to show the maximum brightness which would normally be encountered by the eye. However, in a large office with a ten or twelve foot ceiling the luminaires which cause the most annoyance will be seen at angles between 10 and 20 deg. below the horizontal. In other words, the candle-power in the direction of the eye which causes the most annoyance in this case will be that between 70 and 80 deg. from the nadir, as shown on the candle-power curve. Also the maximum brightness from this viewing position will be very close to that shown for the readings made in a horizontal direction on the lower portion of the globe.

The purpose of taking brightness readings on different portions of the globe and in different directions is to show the distribution of brightness and to determine to some extent the diffusing qualities of the globe. It will be noted that brightness readings at points "A" and "B," "C" and "G," and "F" and "B" are at right angles to each other. In each case one is normal to the luminaire looking toward the light source and the other is measured at nearly grazing incidence. Examination of a good many reports indicates that the ratio of brightness at grazing incidence to that at normal incidence shall be in the order of 0.65 or greater. It is obvious, also, that the brightness at points "K" and "B," "I" and "E," and "J" and "E" are read in directions which make an angle of 45 deg. with each other. Examination of a number of tests indicates that the ratio of brightness at 45 deg. to that at normal incidence at any point should be in the order of 0.8 or greater.

All the brightness readings, except "E," "I" and "J," are made with the globe rotating so as to give the average brightness around the globe. The readings at "E," "I" and "J" are made with the globe stationary, as it is specified that they are to be read on the brightest visible spot when the globe is viewed at approximately 45 deg. from the vertical.

Remarks

There are certain characteristics of globes which cannot be determined by brightness and candle-power readings and yet which are important in forming an opinion as to the fitness of a globe for any particular application. These points should be stated by the laboratory under the heading "Remarks." They should particularly call attention to a visible filament, a spotted appearance, or to excessively thin spots.

Specifications for Acceptance of Diffusing Glassware

One of the main purposes of these standard testing specifications is to provide a test so made that any purchaser may accept it as truly representing the product. It should, to a large extent, obviate the necessity of special tests and, therefore, should, in the long run be cheaper to the manufacturer. To cover this point it is suggested that the following paragraph might be included in specifications for the lighting equipment of buildings, when diffusing glassware is to be used.

> The contractor shall submit with his bid a properly certified test, made on the basis of the I. E. S. Standard Specifications, of the glassware which he proposes to use, with the understanding that the luminaires as delivered will comply with the physical and photometric characteristics as disclosed by the test report submitted.

As a further specification the standard fitter dimensions as adopted by the Illuminating Glassware Guild and the National Council of Lighting Fixture Manufacturers may be used, as given in the following tabulation:

Maximum diameter of neck (h in Fig. 1) in inches:

Nominal	*Basic*	*Minimum*	*Maximum*
4	3-31/32	3-13/16	4
6	5-31/32	5-13/16	6
8	7-31/32	7-13/16	8

Distance along axis from top to minimum diameter of neck in inches (c in Fig. 1):

Nominal fitter diameter in inches	*"c" in inches*
4	3/8 plus or minus 1/16
6	7/16 plus or minus 1/8
8	7/16 plus or minus 1/8

Incandescent Floodlight Testing Procedure

Introduction

The photometry of floodlights is inherently a difficult operation. Various laboratories and individuals each use different methods, dictated often by differences reflecting the viewpoint of the responsible individual. But even where the methods of test are in good agreement, there are liable to be wide variations in the interpretations of the results of the tests.

The following procedure specifies definite methods for testing floodlights and establishes a uniform procedure for the calculating and reporting of results. Since the methods given are designed to cover the entire field of floodlight testing, the instructions are complete and satisfactory for projectors giving unsymmetrical light distribution. In the case of a floodlight projector having a symmetrical beam, it is possible to simplify the method and the calculations as noted in the instructions. The nature of the test made according to the following method is strictly a laboratory operation. While variations from the outlined method are possible for quick intercomparative tests, these instructions are not concerned at the present time with these methods.

The instructions are divided as follows:

(1) Description of the floodlight.
(2) Description of the lamp.

(3) Procedure for making observations.
(4) Computation of results.
(5) Essential results to be reported.
(6) Necessary constants for computation.
(7) Sample report sheets.

(1) Description of the Floodlight

The floodlight chosen for test should be representative of manufacturer's regular product of the equipment desired to be tested.

Report data should give complete description of floodlight, including:

Manufacturer's Name
Type and Catalog Number
Reflector
    Description—shape.
    Material—Manufacturer's designation.
    Dimensions—Sketch of reflector section.
        Diameter and overall depth.
        Lamp and filament position.
    Cover Glass—Manufacturer's designation.
        Description—shape.
        Optical character of surface.
    Accessory Light Control Apparatus
    Focusing Mechanism
    Sketch of Complete Projector, sufficient for identification including reflector dimensions.

It is desirable to standardize the letters used for dimension identification of the reflector sketch, although this procedure has not been followed in the sample report submitted. It is recommended that letters be standardized as follows:

A—Light Center Length (the light center length of a lamp with a threaded base is the distance from the base contact to the center of the filament measured on the axis of the lamp).
B—Axial Length of Light Source (filament).
C—Width of Light Source (filament) measured across the axis, parallel to the plane of the lead wires.
D—Working Length (the working length is defined for convenience in measurement as the distance along the reflector axis from the center of the light source to the inside surface of the reflector or to plane of inside edge of rear opening).
E—Reflector Diameter.

(2) Description of the Lamp

Lamps chosen for test in equipment should be very carefully selected and of current design. The size of light source should be within 10 per cent of the manufacturer's design dimensions. Lamps should be aged sufficiently to stabilize candle-power before using as test lamps. A satisfactory aging process is to burn lamps for one hour at normal volts.

Report data should give the following lamp information:

Nominal Rating
    Service (Floodlight, spotlight, projection, general lighting service, etc.)
    Volts
    Watts
    Rated Initial Lumens
    Bulb Designation (PS-52, G-40, etc.)
    Base (mogul screw, medium screw, etc.)
    Light center length (distance from cap of base to center of light source)
    Filament Designation (C-5, C-13, C-7A, etc.)
    Light Source Dimensions (width and axial length in millimeters).

(3) Procedure for Making Observations

a. Calibration of Standard Lamp and Photometer

An acceptable lamp of the desired size and service should be aged and calibrated for current at rated lumen output, and also calibrated for intensity in a horizontal direction, as indicated by permanent markings (fiducial lines) placed on the bulb.

The calibration data of the lamp then consist of three items:

Rated light output in lumens,
Fiducial intensity in candle-power,
Input in amperes and volts.

It will be noted that having the fiducial intensity in candle-power and the rated output in lumens, the numerical ratio between the total bare lamp output in lumens and the intensity in the marked direction can be calculated. The fact that this numerical ratio is independent of the current or voltage at which the lamp is held is the basis of the following method for obtaining the projector illumination values. Of course, the lamp can be used as an absolute standard of intensity, but for the purpose of these tests it is better to use it as a combined standard and test lamp. The lamp is held at some definite current value instead of voltage value throughout the test, which further eliminates possible errors due to socket drop or faulty electrical connections.

The standard lamp is first used to calibrate the photometer with which the floodlight is to be tested. Since the intensity of the standard lamp in the marked direction is a fixed numerical ratio to the total output of the lamp in lumens, regardless of the current at which the lamp is held, it is possible to calibrate the photometer by light received from the bare lamp in the marked direction, as though the lamp was operated to give rated intensity. Since the lamp is held at the same current throughout the standardization and the test, projector illumination values will be determined which will be the same, as if the lamp was held at rated lumen output throughout test.

For this purpose any ammeter of good constancy and giving a large scale deflection for the current to be measured is satisfactory. The exact meter calibration need not be known. In general, it is best to hold the current about 5 per cent less than the calibration current in order to insure minimum change of light output from the lamp during the test. However, the selected current must be carefully maintained throughout the test. By calibrating the photometer directly against the test lamp, regardless of the exact candle-power at which the lamp is held, projector illumination values are obtained in terms of the standardization values of the lamp.

The standard lamp is placed at a measured distance D (in feet) from the photometer head, so that the illumination received by the photometer plate is that established by the fiducial lines on the bulb. The assumed illumination is then

$$E = \frac{I}{D^2} \text{ Foot-candles}$$

where I is the standardized fiducial intensity in candles. This value of E is used to find the scale constant of the photometer. When the scale reading is S, then

$$\text{Constant } C \times S = E \text{ foot-candles}$$

The standard lamp is then adjusted in the floodlight as previously described, connected with the same ammeter as used for the previous calibration and the test carried on at the selected current.

While the light output and beam intensities under these conditions will be, in general, less than the actual output in intensities of the lamp at normal rating, this method of calibrating the photometer exactly compensates for this difference, so that the photometer readings times Constant C are correct.

b. Adjustment of Lamp in Floodlight

In general, the focusing of the lamp in the projector is to be done at a distance of 100 feet or more from the observing screen, and should be done at the same distance at which the photometer readings are made. In order to have definite location of the light source (filament), lamps for base-up or base-down burning should be set in the floodlight with the lead wires away from the principal optical element. For lamps which burn in horizontal position, the lead wires should be placed uppermost.

The lamp should be adjusted in the floodlight to give the narrowest uniform and symmetrical beam. The determination of reference lines for the beam can be made visually when feasible. In many cases it will be necessary to determine the reference lines by establishing the vertical and horizontal limits of the beam. The intersecting lines halfway between these limits will constitute the reference lines.

c. Method of Testing

As a general rule, a floodlight beam is inclined to be uneven in intensity. Traces of filament images are nearly always visible, and unless care is taken in the photometric exploration, will cause the results to be either too high or too low, depending upon the extent to which the images fall upon the photometer test plate. If the floodlight beam is not symmetrical in outline, a general and complete exploration of the entire beam section may be necessary to determine its true formation.

The arrangement of test points that can most conveniently be made is a rectangular spacing of stations, so that they will in general resemble a checkerboard in spacing, but the edges of the explored field will have the general outline of the beam section, that is, circular or oblong.

The real axis of the beam, if the beam has sufficient symmetry to have an axis, can be located only after the test has been completed and the data plotted. It is, therefore, necessary to estimate the position of the axis by visual observations on the edges of the beam or by other means. This arbitrarily selected axis is used throughout the test.

As previously stated, floodlight beams usually show visible traces of filament images. If the photometric observation is made to cover too small an area, these filament images may cause erratic results which are difficult to reconcile with the rest of the data. For this reason an integrating device should be used which will integrate the ilumination over one square degree (20.94 in. x 20.94 in. for 100 ft. testing range).

This method of measuring candle-power values averages out minor variations in the one degree beam, and makes possible the obtaining of less erratic and, therefore, more readily duplicatable data.

The collecting device is set up 100 ft. or more from the floodlight. The method of taking observations is to traverse the beam with such spacings as to give approximately 100 reading stations uniformly spaced throughout the beam, and in addition, to obtain the candle-power values along eight equally spaced radial lines carried out to the extreme angular range of the stray light. The test, therefore, involves a series of stations spaced in a rectangular manner over the area of the beam, plus stations spaced on eight equally spaced radial lines.

[NOTE:—An exception to the above occurs when the beam is known to be symmetrical about a central axis, in which case four radial lines of exploration from the axis to the limit of stray light will suffice, or the alternative method of an integrating photometer which measures the light in concentric circular zones may be used. Reading stations in the beam are to be spaced approximately one-tenth of the beam spread.]

This method of taking readings insures complete information as to the beam characteristics, and also gives sufficient data to discuss the distribution of stray light from the floodlight. This method of testing requires that a suitable holder be used for the floodlight, so that the floodlight can be rotated to definite degrees in both the horizontal and vertical directions. A conveniently simple method is to mount the floodlight on a hinged platform which can be raised or lowered, or to use the floodlight trunnions, and set at predetermined degree positions. This platform is then mounted on a turntable with its center directly under the test unit. The turntable is provided with a scale and pointer, so that horizontal angles can be obtained.

A necessary practice before setting up the reflector and starting measurements is to make sure that all glass parts are thoroughly clean.

Since the illumination to be measured by the photometer is in many cases quite small, adequate precautions must be taken to eliminate errors due to stray light. It is desirable that the walls and ceiling and floor of the test room be black, and that screens be provided to cut off the light reflected from any of the building surfaces. At large angles of incidence of the light from the unit to the walls or floor of the room, even very dull surfaces have a comparatively high specular reflection.

As a suggested method, the exploration of the horizontal and vertical axis to the limits of the stray light should be made first, followed by horizontal traverses at the various vertical angles to include the limits of the beam, and then followed by the remaining radial angular traverses of the total lighted area. This method of exploration permits of checking back frequently at the zero setting of both the floodlight degree scales, which will eliminate the possibility of error due to changing candlepower of the lamp throughout the test.

The horizontal and vertical traverses can be made directly from the degree settings on the vertical and horizontal scales of the floodlight holder. In the case of the angular traverses, which will be in between the vertical and horizontal traverses, a table is given in the appendix for the correct degree settings, to take care of the fact that the settings for these angles cannot be read directly on the scales.

Since this method is laid out to cover floodlights of from narrow to wide beam divergences, it is important to determine before starting the test the degree spacing at which readings are to be made. Approximate degree limits for the beam should be determined. This can usually be done by visual inspection. The spacing for the stations is taken so that approximately 100 readings can be made throughout the beam. To simplify the calculation, spherical constants are given for equal spacing, vertical and horizontal, by spaces of 1, 1½, 2, 3, and 5 deg. By a proper selection of these steps any size of beam can be explored by about 100 equally spaced steps. Since the stray light outside the border of the beam does not vary, as a rule, very sharply, the readings along the axial traverses are to be made for all types of floodlights at 5 degree spacings.

(4) Computation of Results

The spherical area of the observing section of the photometer, which is one square degree, is 0.000305 when the radius of the spherical shell comprising the field of exploration is unity. The product of this factor times the square of the distance from the collecting device to the floodlight, times the foot-candle value is the average lumens in the one square degree area of the collecting device. The method of rotating the floodlight around a vertical axis, making equal angular steps in the principal horizontal plane, makes the actual spacing for the elevated or depressed beam somewhat less than the set values. Thus with the beam elevated 30 deg. and rotated 10 deg. in the horizontal plane, the actual vertical distance traversed by a point is somewhat less than 30 deg., but this may be corrected by using a proportionately reduced area for the computation of lumens at the 10-deg. angle. The reason for this can be appreciated when it is realized that the elevated and depressed great circles through the horizontal axis vary in spacing and converge toward the 90 deg. points of the horizontal scale setting. The tables given in the appendix of constants for the conversion of candles into lumens for 1, 1½, 2, 3 and 5 deg. spacings automatically take care of this correction.

For wide angle beams the spacings in degrees can usually be greater than one degree. Since this means measuring a one square degree area at intervals beyond the spacing of the square degree of the photometer, a factor must be used to correct for the fact that this reading represents a larger area than one square degree. If, for example, it is necessary to have the stations 2 deg. apart, the constants may be multiplied by 4, that is 2 times 2, or the curves may be plotted and the intermediate points for one degree spacings obtained from the curves. The first method is the preferable one.

The method of computing the results involves, first plotting the change of candle-power across each of the horizontal traverses in the beam and working out from these data the isocandle and the beam limit curves of the beam. The limits of the beam are to be taken as 10 per cent of the average of the ten highest candle-power values recorded in the prescribed exploration of the beam.

[NOTE:—Where a beam is of such symmetry as to permit of readings on only the two major axes, the limits of the beam shall be determined by 10 per cent of the highest reading.]

The computation of the lumens in the beam is made by summing the lumens of each individual test area, making suitable allowances in area and candle power value where a test area lies partially within the beam and partially in the stray light area.

An approximate computation of the stray light is comparatively simple when the beam is circular, but is a more difficult operation when the beam is of a spread or elliptical shape.

The computation of the stray light from a circular beam involves only the averaging of the photometer readings on the same degree setting for each of the angular traverses, and multiplying by a constant representing that particular zone area times the distance in feet squared. Of course, the zone areas involved will not include areas within the beam proper.

In the case of the elliptical beam, since the beam extends into the concentric zone areas, deduction must be made for the light already accounted for in the beam itself. A method sufficiently accurate for even extreme cases is to compute the average lumens in the annular zone area by averaging the photometer readings for the same degree settings of all of the radial traverses except those which are in the beam itself. The stray light based on the averages of the readings of the traverses outside of the beam is considered to extend at the same average value for the zone through the beam. An estimate is then made of the amount of stray light in the concentric zone, which is represented in the beam. This may be done by determining the ratio of beam area in the zone to the entire concentric zone, in terms of the average angle intercepted by the beam section of the zone.

A method adapted for ordinary beams of elliptical shape is to average the photometer readings for the same degree setting of the angular traverses as though the values within the beam were zeros. While

FIG. 4—DATA SHEET FOR FLOODLIGHT.

this method makes correction values which are too small at the center of the beam and too large at the extremities, it will usually average out to give an approximately correct result.

The lumens obtained by either of the above methods for the concentric zones in the stray light area are added together and represent the stray light.

It must be remembered that the obtaining of exact values for quantity of stray light is a very difficult operation, due to the fact that the level of illumination is very low and that a considerable amount of light may be found in a comparatively narrow concentric band. To obtain this value with the same degree of accuracy as the beam lumens would necessitate in some cases a prohibitive number of readings over the entire lighted area. A table of constants for computing zonal lumens is given in the appendix for concentric zone areas of 5-deg. and 10-deg. widths.

The beam efficiency of the floodlight is computed using the ratio of beam lumens to the lumen output of the lamp. The overall efficiency of the floodlight is computed using the ratio of the total lumen output of the floodlight to the lumen output of the lamp.

(5) Results to Be Reported

The report of a test made according to this procedure should be marked, "Tested according to I. E. S. Standard Procedure."

Fig. 5-A, 5-B, 5-C and 5-D show the method of reporting results. It will be noted that the following results are shown:

(1) Complete description of floodlight.
(2) Complete description of lamp.
  (a) If other methods than those outlined in these instructions are used for standardizing lamp and photometer, reporting candle-power and lumen results for the floodlight should be based on rated lamp lumen output.
  (b) Lamp volts and watts should be reported for rated lumen output.
(3) The maximum beam candle-power as recorded in the prescribed beam exploration.
(4) The beam spread in degrees in both vertical and horizontal directions.
(5) Curves showing the horizontal and vertical candle-power distribution along the reference lines averaged about the axial line.
(6) The outline of the beam.
(7) Tabulation of candle-power for test stations.
(8) The beam efficiency of the floodlight.
(9) The overall efficiency.
(10) Distance at which photometer readings were made.
(11) Angle of cut-off of floodlight in horizontal or vertical plane or both, depending on the service for which the floodlight is designed.
(12) Note of any modification of the preceding instructions.

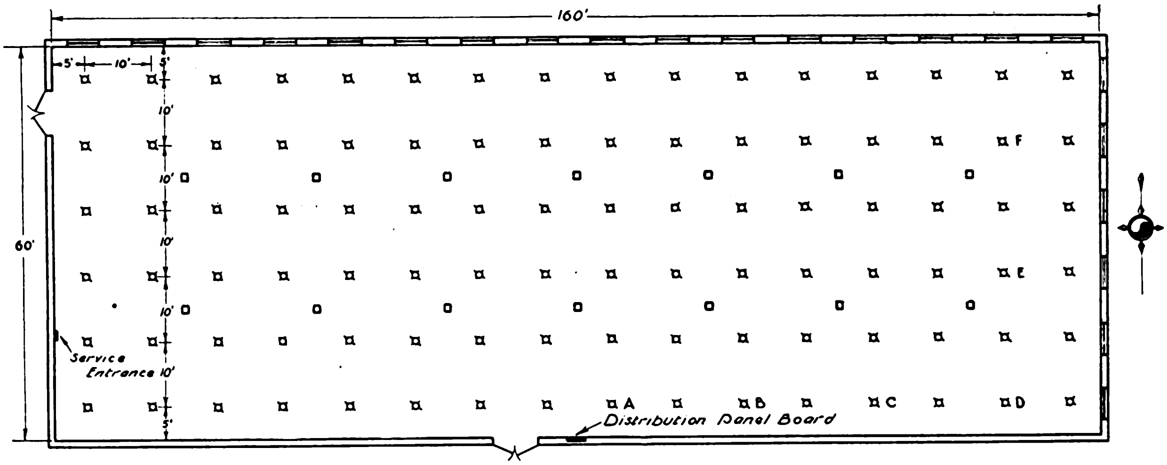
REPORT OF ADEQUATE WIRING SUBCOMMITTEE

During the past few months this subcommittee has made a study of the subject of cost of adequate wiring for lighting circuits. It is very evident that the demand for higher illumination level is becoming more manifest each day; higher wattage lamps are replacing smaller lamps on circuits that already were overloaded; wiring is often installed that is insufficient to serve the present day load to say nothing of the possibilities of future needs.

In order to make a study of the actual costs and lighting results of wiring, a plan for a new building showing the construction details and the lighting layout was sent to electrical contractors in five different cities. The construction specifications for the building as sent to the contractors are included in the appendix to this report. Fig. 6 shows the plan view with the location of outlets, panel board, and service entrance. The contractors were asked to submit cost estimates on complete wiring for this building, assuming the six following different conditions, the first five of which were to be based on



LIGHTING LAYOUT
for
NEW BROWN ANNEX BLDG.

¤ Outlet to be wired according to attached specifications. All wires are to be placed in Conduit, concealed in the Flat Slab Concrete Construction. The finished ceiling height is 12 feet.

FIG. 6—LIGHTING LAYOUT.

good practice for wiring as shown by the specifications in the appendix.

1. Each of the 96 outlets to be equipped with 1-100 watt lamp.
2. Each of the 96 outlets to be equipped with 1-150 watt lamp.
3. Each of the 96 outlets to be equipped with 1-200 watt lamp.
4. Each of the 96 outlets to be equipped with 1-300 watt lamp.
5. Each of the 96 outlets to be equipped with 1-500 watt lamp.
6. Each of the 96 outlets to be equipped with 1-300 watt lamp, disregarding entirely the two volt maximum drop and all other definite specifications as given for the preceding conditions, except that conductors must be placed in iron pipe conduit concealed in concrete, and the work must at least meet the requirements of the National Electrical Code for Electric Wiring, as recommended by the National Fire Protection Association.

Eleven different cost estimates were returned from the five cities. The bids were submitted in the form shown in Table X, which not only gives the cost data but also the sizes of wire to be used for typical branch circuits. The cost estimates given in the table are the averages obtained from the eleven different bids submitted. The wire sizes for typical branch circuits are the largest sizes specified by a majority of the bidders. Table XI shows the cost per outlet and cost per watt for wiring. These data are also shown by curves in Fig. 7 and 8.

TABLE X

AVERAGE ESTIMATES SUBMITTED BY ELEVEN ELECTRICAL CONTRACTORS

	Wattage per Outlet	Outlets per Circuit	No. of Branch Circuits	Wire Sizes To Be Used							Cost to Owner for Complete Jobs*		
				Three-wire Feeder	Typical Branch Circuits Panel Board to Bays (see blueprint)

Lighting Trends Demand Better Lighting

The standards of lighting as evidenced by the present day lighting of buildings are, as a whole, very low. The number of lighting systems that can be classified as those providing illumination of modern standards are relatively few in comparison to the number of those which are below good practice. Furthermore, the saturation point on lighting is not even approached in the well illuminated interiors, and the best authorities today would hesitate to hazard an opinion as to when the demand for more and better lighting will cease. It is, therefore, obvious that the lighting trends are upward. Larger sizes and more lamps will be installed as time goes on. In view of this fact, serious consideration should be given to the proper wiring of buildings at the present time in order to minimize not only immediate losses which result from inadequate wiring, but also greater losses which will inevitably occur when it is desired to employ larger lamps.

In present lighting installations, the wattage is often as much as doubled without rewiring. From the wiring data submitted for this report, a typical example can be shown as to what happens when 300-watt lamps are substituted for 150-watt lamps on a circuit originally designed for 150-watts per outlet. In order to find the magnitude of the losses for this typical example, it will first be necessary to analyze the cost of lighting, assuming that the building is wired in accordance with good practice for a 300-watt installation (System 4, Table X), and compare the losses with those which would be obtained when the 300-watt lamps are installed on the 150-watt per outlet system (System 2). The wire sizes shown in Table X for the 300- and 150-watt lamps were used in the calculations. It was assumed that the lamps would be burned 1500 hours a year at an energy rate of 5 cents per kilowatt hour.

Analysis of System No. 4

Using the wire sizes No. 12 and No. 10 as recommended by the bidders, the lamps burn at normal voltage. Thus 100 per cent or normal life, wattage and light output are obtained. The annual energy cost amounts to

$$96 \text{ outlets} \times \frac{300}{1000} \text{ kw.} \times 1500 \times 5\text{c.} = \$2{,}160$$

The cost of lamps was figured at the net price obtained on a $600 consumer lamp contract. It was assumed that this size of lamp contract would be fulfilled since the building under consideration was defined as an annex to a larger building. The annual lamp cost for 300-watt lamps for this layout is

$$96 \times \$0.95 \times \frac{1500}{1000} = \$136.80$$

The loss due to current overcoming resistance (I^2R) in this case amounts to $28.46 annually as shown from Table XII. This cost, added to energy and lamp costs, brings the total annual operating cost to

$$\$2{,}160 + \$136.80 + \$28.46 = \$2{,}325.26$$

From this system of lighting the lumen hours of lights obtained is

$$96 \times 5300 \times 1500 = 763 \text{ million lumen hours}$$

When the lamps are operating at normal voltage—115 volts—the voltage drop averages 1.5 volts (Table XII). The voltage at the panel board is, therefore, 116.5 volts.

TABLE XII

Computations for Voltage Drop and I^2R Loss for System No. 4 300 Watts per Outlet—1200 Watts per Circuit—115 Volts I = 10.44 Amperes per Circuit I^2 — 109.

Average voltage drop per circuit—1.5.

$$\text{Cost of Energy loss} = \frac{379.48}{1000} \times 1500 \text{ hrs.} \times 5¢ = \$28.46.$$

Analysis of System No. 2, Assuming 300 Watts Per Outlet

If the 300-watt, 115 volt lamps are operated on circuits designed for 150-watts per outlet, we find that the average voltage drop is 4 volts (Table XIII). Since the normal panel voltage is 116.5 volts, the lamps will be operating at 112.5 volts or 2.5 volts below their rated voltage. This also reduces the lamp wattage to 96.6 per cent of normal and the lumen output to 93 per cent of normal, while the life is increased 33⅓ per cent.

The annual energy cost amounts to

$$96 \text{ outlets} \times \frac{290}{1000} \text{kw.} \times 1500 \text{ hr.} \times 5\text{c.} = \$2{,}088.$$

The cost of lamps is

$$96 \times \$0.95 \times \frac{1500}{1333} = \$102.62$$

The I^2R loss from Table XIII is \$76.52.

The total annual operating cost for this system is

$$\$2{,}088 + \$102.62 + \$76.52 = \$2{,}270.74$$

From this system of lighting the lumen hours of light obtained is

$$96 \times 4930 \times 1500 = 710 \text{ million lumen hours}$$

From the foregoing analysis of Systems 4 and 2, it is found that for an annual saving in operating cost of \$2,325.26 — \$2,270.74, or \$55.52, there is a loss in light of 53 million lumen hours. Since the cost per million lumen hours from System 4 is \$2,325.26 ÷ 763 or \$3.05 then the cost of light lost in System 2 is

$$53 \times \$3.05 \text{ or } \$161.65$$

This amount minus \$55.52 gives a net loss of \$106.13 due to inadequate wiring.

TABLE XIII

Computations for Voltage Drop and I^2R Loss for System No. 2 When 300 Watt Lamps Are Installed. 2400 Watts per Circuit. I = 20.9 Amperes per Circuit. $I^2 = 436$.

Typical Branch Circuits	Wire Size	Load Center Feet	Ohms R	I R Drop per Circuit Volts	I^2R Loss per Circuit Watts	No. of Branch Circuits	All Circuits	
							I R Drop Volts	I^2R Loss Watts

F	10	97	0.194	4.05	84.6	2	8.10	169.2
					Totals...	....	48.90	1020.2

Average voltage drop per circuit—4.0.

Cost of energy loss $= \frac{1020.2}{1000} \times 1500$ hrs. $\times$ 5¢ = \$76.52.

From the installation cost estimates for Systems 2 and 4 as given in Table X, it is found that System 4 costs \$236 more than System 2. It is, therefore, seen that by an added initial investment in this case of \$236 for better wiring, an annual saving of \$106.13 in light is obtained during the time when the wattage might be doubled. Since this is a typical instance, it may be more useful to express these costs in terms of dollars per outlet. To wire so as to insure enough copper in the circuits for 300 watts per outlet to minimize losses, costs \$9.93, or approximately \$10 per outlet (from Table XI). The cost of wiring for only 150 watts per outlet is approximately \$7.50. The better wiring, therefore, will cost \$2.50 more per outlet, but will insure the system against an annual loss of \$1.10 per outlet. It is also a fact that, during the time when the initial installation of 150-watt lamps is used, light would be produced more economically from a wiring installation designed to accommodate the higher wattage lamps. It can, therefore, in general be concluded that an initial investment of a few extra dollars in the wiring system will pay an exceptionally high dividend when the standard of illumination is increased by installing higher wattage lamps.

Inadequate Wiring Results from Cut-Rate Jobs

There is a tendency on the part of some electrical contractors and builders to try to reduce costs to such an extent that not only are the requirements for the future disregarded, but also the present requirements are not met. An appreciation of what better lighting is and what it will do is growing very rapidly. Tenants are beginning to write their own lighting specifications in their leases before signing them. Just such an instance recently occurred which brought out emphatically the expense of inadequate wiring and the need for more careful consideration of wiring requirements. A tenant was considering the lease of a suite of offices in a modern building that had very recently been completed. The prospective tenant insisted that the lighting be of a high order. The building manager agreed to provide illumination in accordance with the tenant's specifications, and in order to comply with this agreement he was very much exasperated when he learned that the changes which he had to make because of inadequate wiring resulted in an expense of over \$2,000. The so-called "modern" building was probably modern in all other respects excepting wiring.

In making wiring specifications, many electrical contractors and builders consider the current carrying capacity of the wire as a criterion for wire sizes. The wire sizes so specified in the National Electrical Code are intended only to regulate the installation of electrical apparatus so that fire risks would be minimized. The Code should, therefore, only be considered as a guide to safe carrying capacity of wires, but not as a guide to the economical distribution of energy.

In many instances electrical contractors and builders use their local city code as a guide in laying out wiring jobs. These codes often specify only the maximum number of outlets on a circuit which often leads the contractor to standardize on one wire size which probably is entirely inadequate for the great majority of jobs. Such procedure gives no opportunity for consideration of the load that the circuits may be called upon to carry or the resulting losses which accrue through heat and voltage drop. The effect of cutting down materials to save costs is illustrated by again using the 300-watt installation as an example.

Referring to Table X, System 6, the average figures submitted for this installation by the eleven contractors are given. In this case, as noted before, all definite specifications were disregarded, it being necessary only to meet the requirements of the National Electrical Code for wiring.

From the computations already made on System 4, we found that the voltage at the panel board was 116.5 volts. When operating on the smaller wire sizes as specified in System 6, the average voltage drop is 3.5 volts (Table XIV). The lamps on this system are, therefore, burning at 113 volts. At this voltage, the wattage of the lamps is 97.5 per cent of normal and the lumen output is reduced to 94 per cent of normal. The life of the lamps is increased to 125.8 per cent.

The annual energy cost amounts to

$$96 \text{ outlets} \times \frac{292}{1000} \text{ kw.} \times 1500 \text{ hr.} \times 5\text{c.} = \$2{,}102.40$$

The cost of lamps is

$$96 \times \$0.95 \times \frac{1500}{1258} = \$108.74$$

The I^2R loss from Table XIV is $66.64. The total annual operating cost for this system is

$$\$2{,}102.40 + \$108.74 + \$66.64 = \$2{,}277.78$$

From this system of lighting the lumen hours of light obtained is

$$96 \times 4980 \times 1500 = 717 \text{ million lumen hours}$$

By comparing the foregoing analysis with that of System 4, we find that for an annual saving in operating cost of $2,325.26 — $2,277.78, or $47.48, there is a loss in light of 46 million lumen hours. Since the cost per million lumen hours from System 4 is $3.05, then the cost of light lost in System 6 is $140.30. This amount minus $47.48 gives a net loss of $92.82 because of inadequate wiring.

TABLE XIV

Computations for Voltage Drop and I^2R Loss for System No. 6 300 Watts per Outlet—1200 Watts per Circuit—115 Volts. I = 10.44 Amperes per Circuit. $I^2 = 109$.

Typical Branch Circuits	Wire Size	Load Center Feet	Ohms R	I R Drop per Circuit Volts	I^2R Loss per Circuit Watts	No. of Branch Circuits	All Circuits	
							I R Drop Volts	I^2R Loss Watts
A	14	24	0.1212	1.268	13.2	2	2.536	26.4
B	14	42	0.212	2.216	23.1	4	8.864	92.4
C	14	62	0.313	3.27	34.1	6	19.62	204.6
D	14	82	0.414	4.32	45.2	6	25.92	271.2
E	14	86	0.434	4.54	47.3	4	18.16	189.2
F	14	95	0.480	5.02	52.4	2	10.04	104.8
					Totals.	......	85.14	888.6

Average voltage drop per circuit—3.5.

$$\text{Cost of energy lost} = \frac{888.6}{1000} \times 1500 \text{ hrs.} \times 5¢ = \$66.64.$$

From the installation cost estimates for Systems 4 and 6, Table X, it is found that System 4 costs $157 more than System 6. It is evident, therefore, that by an added initial investment of $157 for proper wiring, an annual saving of $92.82 in light is obtained. In other words, for an added initial investment of $1.64 per outlet a return of $0.96 per outlet will be obtained each year.

Discussion of Data and Conclusions

(1) From the cost estimates given in Table XI it will be noted that the cost of wiring increases with the increase in wattage per outlet, as would be expected. It is interesting to note that the rise in cost per outlet for materials is quite regular as shown by the curve in Fig. 7. There is a sharper increase in labor cost between 150 and 200 watts per outlet which is probably due to the fact that the number of branch circuits for the 200-watt system are doubled. However, the cost of labor for installing wiring above 200 watts per outlet does not increase as rapidly as does the cost of material. This is apparent from a comparison of the slopes of the curves showing these costs (Fig. 7).

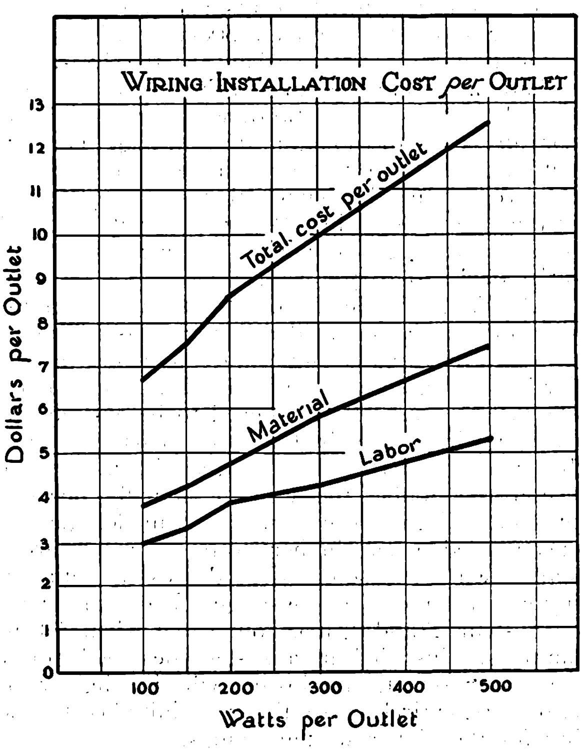

FIG. 7—WIRING INSTALLATION COST PER OUTLET.

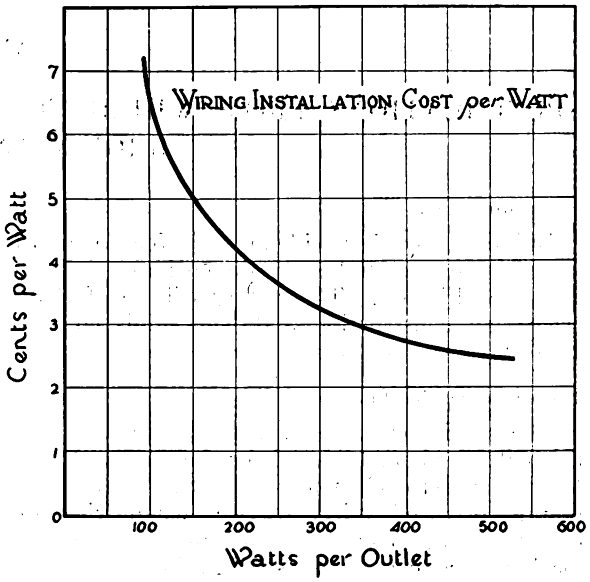

FIG. 8—WIRING INSTALLATION COST PER WATT.

From the curve in Fig. 8, it will be noted that the cost per watt greatly decreases as the wattage per outlet is increased. For example, to install 150 watts per outlet the cost is at the rate of 5 cents per watt, while to double this wattage per outlet reduces the rate to 3⅓ cents per watt. Thus the actual cost for the complete 300-watt wiring installation is only ⅓ greater than for the 150-watt installation. From the curve (Fig. 8) it can be observed that this same ratio of wiring costs holds true for any case of doubling the wattage per outlet within the 100 to 500-watt range. Also it can be observed from this curve that by increasing the wattage per outlet by 50 per cent within the 150 to 500-watt range the wiring cost increase is of the order of 15 to 18 per cent.

(2) With the levels of illumination increasing year by year as demanded for various interiors, it is today of primary importance to make provision for higher wattage than may be demanded for present installations. It is believed to be entirely practical in wiring new buildings to provide at least a 100 per cent safety factor, that is, making provision for double the wattage actually needed at present. If this provision is not made, the losses encountered when higher wattage lamps are installed will very soon offset the extra initial wiring cost for the higher wattage. From the analysis of Systems 2 and 4, it is found that when 300-watt lamps are installed in a system designed for 150 watts per outlet, the losses will, in slightly over two years, entirely offset the extra initial cost of wiring for the higher wattage lamps.

(3) There are many "overloaded" lighting systems in use today which are costly to the owner because he is often unknowingly paying for a considerable amount of light which he never receives. Many of the buildings with these overloaded lighting circuits can well afford to rewire immediately, as the money invested would pay a good dividend. It is, of course, true that in those buildings where the existing outlets are improperly placed or are not sufficient in number of insure uniform distribution of light throughout the room, a rewiring job is imperative.

It should be noted particularly that the cost of estimates given in Table X are for wiring a new building and are, no doubt, in general, somewhat lower than those for rewiring an old building. Where plaster has to be removed, concrete channelled, or similar work done to install wiring, the cost obviously is increased. Referring again to comparative cost analysis of Systems 2 and 4, it is seen that there is an annual saving of $106.15, or $1.11 per outlet for the 300-watt system. Even if this were the only benefit to be gained, it would readily justify a rewiring expense which might even be considerably greater than the $9.93 per outlet as estimated for a new building. However, the value of illumination is not limited to its intrinsic worth, but even greater, its value to good vision and attractiveness of the room. In a factory workroom or store this latter value alone may easily be such as to pay for the rewiring cost many times.

From every viewpoint, then, it is reasonable to conclude that where excessive voltage drop exists, the cost of rewiring is unquestionably justified.

(4) Referring again to the initial wiring installation for a new building, it cannot be over-emphasized that efforts to cut down wiring specifications which would otherwise insure against losses in light and energy in order to reduce costs, often produce just the reverse effect; instead of creating a saving, greater expense is eventually incurred. From the analysis of the cost data for Systems 4 and 6 in Table X, it is found that for the latter system, where the initial wiring cost was cut to a minimum, the cost of light lost in approximately 1½ years would equal the extra cost required for installing a good wiring installation.

APPENDIX

SPECIFICATIONS FROM WHICH TO MAKE COST ESTIMATE FOR WIRING NEW BROWN ANNEX BUILDING

1. Building Plan

Building is 60 feet wide and 160 feet long divided into 24 bays, each having dimensions of 20 x 20 feet (see Fig. 6). The ceiling will be of flat concrete slab construction and when finished will be 12 feet above the floor.

2. Electric Service Entrance

The service entrance will be on the west side of the building about 16 feet from the southwest corner. Electric Service Company will bring service to this point. A fused safety service switch with proper meter loop and equipment to comply with code and local service company's specifications must be installed at this entrance by electrical contractor.

3. Feeder Wires

A 3 wire single phase 115-230 volt feeder shall be installed from service entrance to distribution panel board. The distribution panel board will be placed at about the half way point along the south side of building, thus making the feeder wire approximately 100 feet long.

In computing size of feeder wire, assume a load for each of two unconnected branch circuits equal to the load carried by each of the connected circuits.

4. Distribution Panel Board

A dead front double door distribution panel board 115-230 volt shall be installed flush with wall at about the half way point along the south side of building. This panel shall have slate frame doors and trim. It shall have a 30 ampere single pole toggle switch and plug fuse for each branch circuit. In addition to the connected branch circuits as specified in the table, Paragraph 10, the panel board shall have two unconnected switches for future circuits. For computing size of feeder wire it will be assumed that these two unconnected switches will control circuits of the same capacity as the other connected circuits on the panel.

5. Branch Circuits

The location of outlets shall be as shown on Fig. 6, namely, on 10 x 10 foot spacings symmetrically placed in each of the 20 x 20 foot bays.

The number of outlets per circuit and number of branch circuits will depend upon the size of lamp installed as shown in the table, Paragraph 10.

6. Conduit

Full wall loricated pipe conduit concealed in the concrete must be used with 3C-O concrete boxes as manufactured by Adapti, Steel City. or equal as approved.

7. Wire

Single braid rubber covered wire shall be used for all circuits requiring No. 8 or smaller sizes.

8. Voltage Drop and Size of Conductors

All conductors must be of such size that under full load conditions the voltage drop between panel board and outlets will not exceed 2 volts. The voltage drop in main 3 wire feeder should not exceed 2 volts when all circuits, including the present two extras, are connected (see Paragraph 3).

9. Cost Estimates

A cost estimate for furnishing all material and installing job complete from service entrance to outlet boxes is required for building owner. This cost estimate is to be made, assuming 100 per cent load factor on all circuits for six conditions as follows:

(1) Assume each of the 96 outlets to be equipped with 1-100 watt lamp.

(2) Assume each of the 96 outlets to be equipped with 1-150 watt lamp.

(3) Assume each of the 96 outlets to be equipped with 1-200 watt lamp.

(4) Assume each of the 96 outlets to be equipped with 1-300 watt lamp.

(5) Assume each of the 96 outlets to be equipped with 1-500 watt lamp.

(6) Assume each of the 96 outlets to be equipped with 1-300 watt lamp and disregard entirely the two volt maximum drop, and all other definite specifications as given above in Paragraphs 3 to 8, inclusive, except that conductors must be placed in iron pipe conduit concealed in concrete and the work must at least meet the requirements of the National Electrical Code for Electric Wiring, as recommended by the National Fire Protection Association.

10. Submitting Cost Estimates

Submit cost figures by filling in blanks in following table. Also fill in blanks to show size of feeder wire and size of wire which will be installed, for typical branch circuits to bays as indicated on blueprint as A, B, C, D, E and F.

	Wattage per Outlet	Outlets per Circuit	No. of Branch Circuits	Wire Sizes To Be Used							Cost to Owner for Complete Jobs†		
				Three-wire Feeder*	Typical Branch Circuits Panel Board to Bays (see blueprint)								
					A	B	C	D	E	F	Material	Labor	Total
(1)	100	8	12										
(2)	150	8	12										
(3)	200	4	24										
(4)	300	4	24										
(5)	500	3	32										
(6)	300												

*In computing size of feeder wire allow capacity for the 2 unconnected circuits (see Note 3).

†What is labor rate per hour ———? About what per cent overhead and profit has been assumed in arriving at owner's cost ———?

HOME LIGHTING

PART I—PROMOTION OF HOME LIGHTING SERVICE

Introduction

The subcommittee on Lighting Service has endeavored to point out the potential domestic lighting market and show that this market can be developed by the establishment of a "Service" in Home Lighting. Also it has prepared an outline of the necessary qualifications of a Home Lighting Specialist, the functions of the Lighting Service Division and its value to the electric service company.

This report covers the following subjects:

1. The Potential Market
2. Organization of a Home Lighting Department
3. Activities
4. Equipment
5. Value to Other Departments.

Section I

THE POTENTIAL MARKET

Of the total revenue received by the electric light and power industry during 1928, approximately 35 per cent was derived from the sale of electricity for lighting purposes.

Of the 23,238,000 customers on record as of Dec. 31, 1928, 82 per cent, or 19,077,000, were domestic lighting customers.

An analysis conducted by the National Electric Light Association covering a two-year period (1926-28) showed an increase in domestic customers of 15.1 per cent, an increase in kilowatt-hour sales of 33.8 per cent, but an increase in sales per domestic customer of only 13.6 per cent. The big problem indicated is to increase the energy use per customer. There are more than 19,000,000 homes which are prospects for improved home lighting.

Revenues from Sales of Electric Service, 1928
(From N. E. L. A. Statistical Bulletin No. 3)

		% of Revenues from Consumers	Total
Domestic service (inc'ld'g non-irrigated farms)..	$555,944,000	30.9	29.1
Commercial; small light and power (retail)...	523,180,000	29.1	27.4
Commercial; large light and power (wholesale)	591,195,000	32.8	31.0
Street lighting	74,566,000	4.1	3.9
Street railways and electrified railroads	47,933,000	2.7	2.5
Miscellaneous	8,620,000	0.4	0.4
Total from ultimate consumers	1,801,438,000	100.0	94.3
Other electric enterprises	107,365,000	.....	5.7
Total gross revenues	$1,908,803,000	.....	100.0

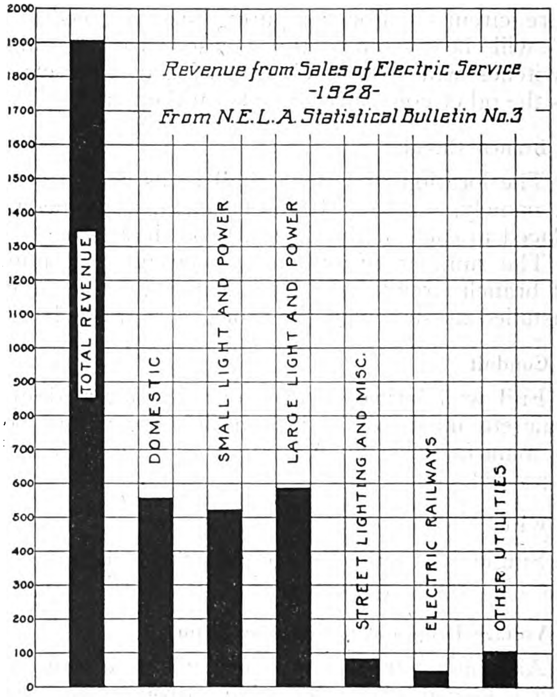

FIG. 1.

Survey and statistics indicate that lighting equipment in the home is far from the point of saturation, and that the home field offers wide possibilities.

According to a 1926 report of the Electricity in the Home Committee, N. E. L. A., the conservative ideal home shows the following wiring and lighting equipment which will supply reasonably convenient utilitarian lighting for the average home. It represents a condition for which the electrical industry should strive as a first milestone.

It is emphasized that these items must be considered not only in a given room, but for a home as a whole, and that they represent averages of several possible satisfactory layouts.

Using the average figure for domestic energy consumption in 1928, viz., 459 kw-hr. per year, the total energy consumed by residence customers totals 8,489,000,000 kw-hr. This load represents a revenue of $555,944,000 or 29 per cent of the total revenue received from all sources. This energy has been used by homes inadequately equipped electrically. If the homes of the country were brought up to the standard of the "conservative ideal" the energy consumption might be raised to 10,418,940,000 kw-hr. representing an annual revenue of $650,000,000. This would result from the increased use of home lighting alone.

In addition to the development work in the present wired homes and the homes being built each year there remain nearly 9,000,000 unwired homes, a

---

Publication No. 289-119. Serial Report, Home Lighting Committee.

COMPARISON OF WIRING AND LIGHTING EQUIPMENT

AVERAGE WIRED AND "CONSERVATIVE IDEAL" HOMES

	Average Wired Home	"Conservative* Ideal" Home	Per Cent Saturation
Convenience outlets......	3.4	10.5	33
Ceiling fixtures .... (satisfactory)	6.1	11.5	53
Wall brackets .... (utilitarian)	2.5	8.0	31
Portable lamps	2.8	8.5	33
Connected load in watts..	954	1,845	51

*Some of the major items pertinent to this "conservative ideal" home are as follows:

Living Room

3 convenience outlets; 1 ceiling fixture; 6 portable lamps (including portables in sunroom, reception hall, dining room and various other places not otherwise listed); 540 watts.

Dining Room

1 convenience outlet; 1 ceiling fixture, 230 watts (1 or 2 small portables might be used here. If so, they would be included in the 6 portable lamps in the foregoing item).

Kitchen

1 convenience outlet; 1 ceiling fixture; 1 wall bracket; 200 watts.

Bedrooms

Average, 2.5 bedrooms per home; 2.5 convenience outlets; 2.5 ceiling fixtures; 5 wall brackets; 2.5 portable lamps; 475 watts.

Bathroom

1 convenience outlet; 2 wall brackets; 100 watts.

Hallway

1 convenience outlet; 1 ceiling fixture; 50 watts.

Basement

1 convenience outlet; 5 fixture outlets; 250 watts.

---

portion of which are coming within reach of central station service every year.

Aside from the revenue which can be obtained in this field, electric service companies should not lose sight of the tremendous influence they can exert toward the conservation of eyesight and the bettering of living conditions by promoting good home lighting.

Therefore, it is recommended that central stations encourage the development of home lighting through the establishment of a Home Lighting Service Department.

The figures used in this report are quoted from and based upon figures secured from N. E. L. A. Headquarters—"Use of Domestic Service and Revenues Received Therefrom in the United States (N. E. L. A. Series)," the report of the 1926 N. E. L. A. Committee on Electricity in the Home and from the N. E. L. A. Statistical Bulletin No. 3, covering the year 1928.

Section II

ORGANIZATION OF HOME LIGHTING SERVICE

I—Place in Electric Service Company

It is assumed that the Home Lighting Service Department will be a part of the New Business or Commercial Division of the electric service company.

The work of the Home Lighting Specialist will fit into the organization of the New Business or Commercial Department as shown in Fig. 3.

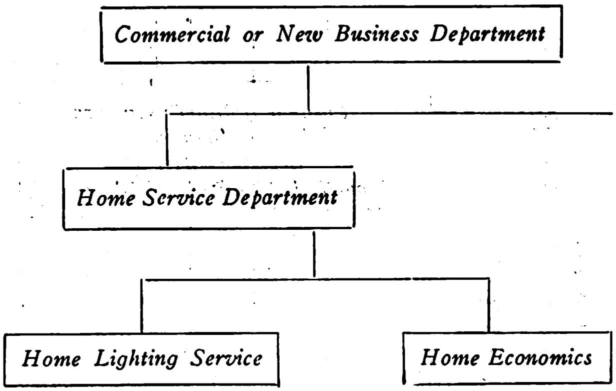

FIG. 3.

The various advisory services rendered by the company to homes should be coordinated in one department, usually designated as the Home Service Department. Home lighting service has become highly specialized, and some companies have developed women devoting their time exclusively to this work.

The Home Lighting Specialist may be a part of the Home Service Department, or in present practice, it may prove desirable to attach the Home Lighting Specialist to an already established Home Lighting Department.

II—Personnel

The number of trained women available for this type of work is limited.

The following qualifications may prove a guide in making a selection:

1. Good breeding, personality, dignity.
2. Background (previous training).
   - (a) A college education is preferable, but a high school education is necessary.
   - (b) Experience in interior decoration, and the use of color is necessary because home lighting and home decoration are closely related.
   - (c) Previous experience in teaching is valuable because teaching gives practice in coordinating ideas and in addressing groups.
   - (d) Experience in public speaking is valuable.
   - (e) Knowledge of fundamentals of home lighting is desirable.
   - (f) Active participation in club work provides valuable training.
3. Age.

   Women of mature judgment are better qualified for this work because—
   - (a) They have dignity and poise, qualities necessary in considering public relations.
   - (b) They have platform presence and inspire confidence in an audience.
   - (c) They inspire confidence in customers when making home lighting recommendations.
   - (d) They are seriously interested in business, thereby reducing turnover of employees.

III—Training of Specialists

It is essential that women inexperienced in lighting should be properly trained before coming into actual contact with the public. A satisfactory method of obtaining lighting information is through the Home Lighting schools conducted by manufacturers of incandescent lamps. Contacts made in these schools with others working in similar fields are invaluable. It is likewise desirable that the Home Lighting Specialist should attend these courses as often as possible in order to keep abreast of new developments.

Means of supplementing this instruction are the bulletins issued by the lamp manufacturers, the National Electric Light Association and the Illuminating Engineering Society. Attendance at conventions and local meetings of lighting societies, lectures and courses in decoration, membership in the Illuminating Engineering Society, and exhibitions of lighting and decoration are valuable aids in this work.

Section III

ACTIVITIES

Explanation of Chart

The good-will factor of business plays an important part in all Home Service work. There is great value in securing and maintaining the confidence and good-will of the people with whom contacts are made. These frequently seem to produce no immediate revenue for the company, but the ultimate value cannot be disregarded. Cooperation with architects, builders, etc., through voluntary service produces gratifying results.

The primary function of a Home Lighting Specialist is, by arousing the lighting consciousness of the residence customers, to improve home lighting conditions, thereby raising the residential load and increasing the revenue.

The Home Lighting Specialist will accomplish this in the following ways:

I—Promotion of Adequate Wiring and Lighting

Before large increases in consumption can be expected from either new or existing houses, it is essential that the wiring be brought up to modern standards. In the case of the new home this may be accomplished by working with the home owner, builder, architect and realtor. In new buildings the wiring is one of the last things to be installed, and is the item which is most often reduced in a spirit of false economy.

When modernizing an existing home, the house owner or lessee will be approached. Exhibitions of present approved wiring practice, of a permanent or portable character, are helpful, particularly demonstration homes correctly wired and lighted, which present to the customers a concrete example.

II—Arousing Lighting Consciousness

Lecture work in home lighting is desirable, as this is the most effective means of reaching any great

number of customers collectively. Such lectures may be given before groups of customers such as women's clubs, church groups, parent-teachers' associations, schools, Young Women's Christian Associations, Girl Scouts and other organized groups of girls, men's service clubs, home demonstration groups under the State Agricultural College auspices and special groups. The Home Lighting Specialist should also take advantage of any opportunities to talk to those in the industry, at employee meetings, inter-company meetings, Illuminating Engineering Society and local N. E. L. A. meetings.

Instruction in making lamp shades is an effective means of focusing the attention of the customer on the lighting conditions in her home and arousing a desire to better these conditions.

Another excellent medium is the publication of articles on adequate wiring, home lighting and home decoration in the trade press, magazine, newspaper, house organ, editorial column and convention paper.

Radio talks and exhibitions are always helpful.

III—Contact with Customers

The Home Lighting Specialist will make contact with individual customers in a general way with the lectures, in a personal way with the lamp shade classes and through employees. Such contacts will result in requests on the part of customers for assistance in improving the lighting conditions in their homes. Where such requests are received, a careful survey of the existing conditions may be made and suitable recommendations insuring adequate lighting presented to the customer. In this work the Home Lighting Specialist will plan the lighting system for new homes, better conditions in existing homes, make convenience outlet surveys, incandescent lamp surveys and decoration surveys, including the selection of fixtures and portable lamps and will give customers advice on lamp and fixture buying. Therefore, it is necessary that the Home Lighting Specialist be in close touch with available lighting equipment in order that she may make practical recommendations.

By improving the lighting in public places, such as clubs, tea rooms, waiting rooms, etc., an example is set which women will follow in their homes.

It is essential that the potential customer market be analyzed in order to permit the intelligent planning of the work. A district survey would provide such an analysis.

The Home Lighting Specialist should be prepared to render assistance to customers having special problems such as the lighting of theatricals, pageants, fairs, parties, etc.

IV—Campaigns

The Home Lighting Specialist should give her support to campaigns designed to improve home lighting conditions. She should cooperate with the Merchandising Department in its efforts to sell better fixtures or portables and in Better Home Movements. She should also work with the Electrical League and contractor dealers where this seems desirable.

V—Committee Work

The Home Lighting Specialist should be encouraged to participate in committee work. This will provide valuable contacts for her and broaden her outlook.

Section IV

EQUIPMENT

The work of the Home Lighting Specialist should be promoted by providing for her a suitable background, and as much equipment as is possible, bearing in mind the changes which will occur, necessitating keeping up to date in all phases of the work.

A. Office Equipment

It is desirable that the Home Lighting Specialist be provided with a suitable space where she may introduce the home atmosphere and show home lighting effects, since she is dealing with women customers who react quickly to surroundings.

A library of books and magazines on home lighting and decoration is essential.

B. Educational Equipment

The Home Lighting Specialist should have informative literature on home lighting for customer distribution and a suitable announcement of her lecture service to send to women's clubs, church organizations, etc.

She will require portable equipment for lecture work and classes.

She should be given opportunities for personal development.

Section V

VALUE

The work of the Home Lighting Specialist will be of value to various departments of the company as follows:

1. New Business Department
   By stimulating the use of electricity through the increased use of convenience outlets, lamps of the proper wattage, portable lamps and fixtures and decorative lighting.
2. Merchandising Department
   By recommending the use of additional incandescent lamps and lighting equipment.
3. Publicity Department
   By affording publicity of the highest type through lectures and classes.
4. Public Relations Department
   By building up customer good will.
5. Home Economics Department
   By providing further contacts for the Home Economics Department.
6. Lighting Bureau
   By rounding out the work of the Bureau.

PART II—MERCHANDISING METHODS FOR THE RELIGHTING OF RESIDENCES

Introduction

A survey of the part which central stations played years ago in merchandising residential lighting fixtures reveals activity throughout the entire country during the time the wiring of old and new homes was a major issue. Among the merchandising offers prevalent at the time, it will be recalled that a combination set of fixtures for the main rooms of the home was most commonly offered along with the wiring installation.

In those early years the great step in satisfaction from no electric service to electric service became so obvious that sales records were undoubtedly made in all parts of the country. During the following years this work was aggressively carried on until now it is generally admitted that a very large part of the homes within reach of central station service are wired.

Since and during the earlier years of house wiring and fixturing great progress has been made in the art of lighting, until now we find that few of the fixtures previously sold render a service commensurate with present standards. Likewise, the standards of wiring have gradually risen to a point which render the wiring of these previously wired homes very inadequate when compared with present good practice.

As in many businesses a complete cycle of development has occurred since the earlier years of house wiring and fixture campaigns. We are now confronted with the problem of returning to these same homes with a story of modern inexpensive and controllable light. The opportunity exists, and it does not appear to be something the central stations can ignore if they are to continue to be as desirous of having their customers obtain the best of service from their product as they always have been.

The substitution of electricity for candles, kerosene and gas for general lighting has become so nearly universal that now it would be difficult to keep electricity from the homes within reach of present lines. This so-called "consciousness" indicates the value which the public now places upon electric service.

The Present Problem

Today the problem is not that of converting the customer from one of the inferior previously used illuminants, but rather a conversion from an unintelligent use to an intelligent use of the illuminants, which is now available and has been available for a considerable period of time. Obviously, selling the advantages of modern lighting presents a more difficult and complex commercial problem than that encountered in the earlier days of electrification. It is not unlikely that the apparent complexity of the present merchandising problem, that of relighting the homes of this country, has kept many of the central stations from entering this field. Other reasons for not entering this field do not properly enter this discussion.

Scattered activities here and there, with reports of failures or mediocre successes, have undoubtedly done much toward creating an unfavorable attitude toward the commercial possibilities of this field. On the other hand there have been a sufficient number of real successes to prove that the job can be done, and from these successful activities and also from those of the less successful, it is possible to gather together pertinent facts which greatly clarify the issues involved. The pioneers have paid the price for their knowledge, and thus it may be safely said that the selling of better lighting in the home has gone through much of the experimental stage. Relighting activities may be undertaken with assurance of success if these activities are properly handled.

The following present a study of methods and a summary of facts taken from the experiences of many central stations extending over a period of years.

Major Commercial Opportunities

The nation-wide Home Lighting Contest[1] revealed the following percentages of unquestionably obsolete lighting fixtures, drop cords, combination gas and electric fixtures, etc.:

	Obsolescence Per cent	Connected Load Watts
Living room	16	141
Dining room	18	125
Kitchen	65	74
Bedrooms	53	52
Bathroom	50	31
Hallways	25	...

In addition to the magnitude of the field indicated from these figures, extensive observations indicate that fully 50 per cent of remaining fixtures do not provide lighting according to present good practice.

Kitchen

From these facts and the actual experiences of a large number of central station companies, there is strong evidence to support the contention that the Kitchen Lighting Campaign should be the first to be conducted. The element of personal taste is less marked in selecting lighting equipment for this room than in the other rooms of the home thus far campaigned, hence one type of fixture is much more universally acceptable. Low price of fixture makes for less sales resistance. Longer hours of burning and a fixture employing one large lamp are guarantees of a definite reward. One type of fixture assures definitely improved and satisfactory lighting results. Only a moderate amount of training of the sales force in the subject of lighting is required.

Porch and House-Number Lighting

Recently the combination porch-light and illuminated house-number has been actively campaigned and with gratifying results. There are a number of points in connection with this campaign item, which make it nearly comparable with kitchen lighting as an initial activity. It is in the class of the lower-priced items. It is relatively free from the item of personal taste. There is practically none in use, and probably the most outstanding feature of practicability lies in the fact that the problem of installation can be exceedingly simple. The salesmen in the majority of cases make the installation by merely substituting the new unit for the old porch globe in the already installed ceiling-holder. Each installation is seen by a large number of people, and in this way it creates a certain amount of self-advertising. Due to the wattage of lamp used it does not appear to be comparable with the kitchen unit as a revenue builder; however, the illuminated number part of the unit should initiate more burning hours for an outlet which is generally quite insignificant.

Dining-Room

The dining-room has been considered the most desirable as the second room for a relighting activity, although a number of second activities have been built around the bedroom or living-room. In communities having a large industrial population there are excellent reasons for choosing the dining-room. In the homes of the industrial worker the dining-room is often used as a place for reading, studying and sewing. This is particularly true where there are children, for the dining-room is the only place in which there is a table of satisfactory size for school work and at which there is a lighting fixture. Good lighting for the conservation of the eyesight of children is a powerful sales argument. Finally, the competition with portable lamps is at a minimum in the dining-room. Lighting activities planned for the dining-room should incorporate lighting education for the sales force. The educational program should specifically develop a proper understanding of the facts pertaining to good lighting and the saving of the eyes of youngsters.

Bedroom

The bedroom also has been campaigned very successfully as a second-room activity. Satisfactory fixtures are usually obtainable costing less than satisfactory fixtures for either the living-room or dining-room, and the sales force need not be as thoroughly trained on the subject of lighting. Personal taste is usually more easily satisfied.

Living-Room

Although there are very good reasons for campaigning the living-room fixtures after the kitchen, very few companies have tried this for their second activity. All members of a family have a specific interest in this room, and when the budgeting of the family resources is considered, changes in furnishings are looked upon with more favor than in other rooms of the home. Pride of ownership is gratified, inasmuch as guests are entertained here. Usage of equipment permits decided increases in electrical consumption. The present disuse of ceiling fixtures which is becoming more customary is due in part to the unsuitability of equipment now installed. A better lighting education of the salesforce is needed for this activity than that which is required for some of the other activities.

---

[1] Report of the Lighting Committee, Commercial National Section, 1924-25 Residence Lighting—Analysis of Home Lighting Contest Primers, M. Luckiesh, Subject Chairman.

Portable Lamps

Portable lamp campaigns have been conducted successfully by a large number of companies, although interest in this relighting item appears to be waning. Competition from many sources accounts in a large measure for this attitude. This item has a unique appeal to people living in rented homes, inasmuch as it can be transported readily. This factor is of considerable importance, for the number of rented homes probably constitutes one-half of the total. At present there is a marked scarcity of portable lamps possessing real lighting merit. Future developments incorporating improved lighting results from portable lamps should offer new opportunities for further development of the residence lighting field.

Laundry

The appeal for better lighting in the laundry is similar to that used in the kitchen. The utility light is a combination of porcelain enamel steel reflector and white glass inclosing globe, equipped with a closed-metal loop-suspension and extension cord which permits in many cases its use where desired without additional wiring. Due to its general usefulness it is not uncommon to find that the sale of one of these units leads to the sale of a second. The work-bench in the garage has drawn many of these units from the ironing or washing machine in the basement. After being inconvenienced in this way on a number of occasions, the housewife has insisted on having the second one purchased, so that she will not be further inconvenienced on laundry days. This unit, while not an unusual revenue producer, provides a means of creating an appreciation of better lighting in the mind of the householder.

Incandescent Lamp Sales

Extensive observations and surveys indicate that people in general do not have an extra supply of lamps on hand. As lamps burn out, empty sockets are created. Procrastination and habit go hand in hand in contributing toward this condition. If these sockets are filled and kept filled, it is not unreasonable to assume that revenue increases and increased customer satisfaction will follow. Furthermore, the introduction into the home of extra lamps of various sizes improves the likelihood of having on hand the right lamp for the socket. Assortment cartons of lamps should contain some of the higher wattage lamps (60-watt and 100-watt), inasmuch as there are a number of places in the average home where these sizes can be used advantageously. The carton lamp sales activity can specifically accomplish two things, namely, fill empty sockets and introduce the higher wattage household sizes of lamps. The achievement of both of these considerations would be a definite step toward adequate lighting in the home.

The carton sale of lamps can be effected through the employee group or through Boy Scout or high school groups. The particular points of merit which facilitate the handling of this activity versus the specific room activity are as follows: The sale price of the item is low, personal taste factor is eliminated, no outside help is necessary inasmuch as the problem of installation is eliminated and only a very limited lighting education is necessary.

Organization

Companies having new business or commercial departments and a regular force of house-to-house solicitors appear to be in a preferred position for successful activities. If, however, the department and solicitors have never sold lighting before, they must be thoroughly trained on lighting subjects before they are sent out. Power salesmen as a rule have not been successfully employed in house-to-house selling; but appliance salesmen, properly educated, have made good records.

Central stations without commercial departments or solicitors have employed temporary solicitors for relighting activities. In general this has proved to be an unsatisfactory undertaking. Solicitors hired temporarily cannot learn central station policies and the proper lighting story in a few days. These temporary salesmen are usually concerned with obtaining commissions, and they have often been found making extraordinary promises which they knew could not be fulfilled.

Employee Cooperation

Many central stations have featured their relighting activities to their employees shortly before the general public announcement. Special price concessions have been made to the employees at this time in order that definite action might follow quickly. This method is of value in getting some actual installations in use and is also of great value in educating employees.

The enthusiastic support of the entire employee group is of great importance, and a definite means of creating it should accompany each activity. Practically how far into the organization this can go depends upon local circumstances. Many trial installations of fixtures have been ordered removed from the homes of friends of central station employees because some employee, a friend of the family in question, either did not know about the activity, or was only lukewarm when questioned concerning the specific fixture. Strange as it may seem, practically all central station employees are looked upon as authorities on things electrical by their circle of friends and acquaintances. The word of mouth advertising which can filter through from employees to their families, friends and then on to the friends of these friends becomes a very big influence in the aggregate. The size of this formidable group warrants that their interest and enthusiasm be fortified by employee enthusiasm.

In some cases central stations have paid commissions to employees bringing in orders for fixtures. Commissions have also been paid to employees bringing in "leads" where sales could be easily made. This offer instills enthusiastic support for the movement and also offers an opportunity for creating a favorable impression for the activity among the employee group.

The enthusiasm of the regular solicitors must not be jeopardized by employees canvassing their territories. The plan used must provide for cooperation between the employee-group and the solicitor-group.

The interest and enthusiasm of the employee-group has been very effectively created through the medium of a sales activity centered about a "home convenience carton" assortment of Mazda lamps. All departments of the company, including meter reading, sales, engineering, line, office, purchasing, etc., have made excellent records in this type of activity. Quotas based on the sale of one carton to each six residence meters have been exceeded in a large number of activities. Single individuals have sold practically 700 cartons of lamps during a single activity. At twenty-five cents per carton, the usual commission, this activity netted these individuals $175. In addition prizes are usually offered.

Plans of Operation

It will be found advantageous to place the guidance and supervision of the lighting activity in the hands of one person. Those companies having a number of communities isolated from the main headquarters can operate the identical activity at the same time with one individual in charge of each of the isolated communities. The managers in each of the separate communities follow the same plan as that set at headquarters, and are made individually responsible for the results in their respective territories.

The manager in general charge must, of course, select the equipment to be sold, establish prices, determine payment schedules, trial installations, salesmen's territories and commissions, determine installation policy, follow-up promptness of installations, establish quotas, advertising, and provide the educational program for the salesmen. Meetings at the beginning of each day are invaluable for the checking of installation orders, for instilling enthusiasm and for the trading of experiences between the salesmen themselves.

The equipment to be sold must do what the story and advertising claims for it. Obsolescence, novelty of appearance, specifications, etc., taken singly are not strong enough in themselves to create sales. Eye conservation appears to create the greatest urge to buy.

Time payments permit of a great number of sales which could not otherwise be made. Payments extending over a period of nine to twelve months have been used in practically all cases, and the amounts are added to the regular electric service billing.

Trial Installations

Trial installations seem to be indispensable. A number of men who have been actively in charge of successful campaigns claim that a relighting activity should not be conducted unless trial installations are incorporated in the plan. The experiences from all fields of lighting confirm the idea that demonstrations of lighting are needed if the message of better lighting is to be conveyed. The trial installation is a means of providing a lighting demonstration, and in this case is even more valuable because it is conducted on the prospective customer's premises. It has been found that a trial installation of sufficient duration (30 days, for example) affords the prospective customer full opportunity to have lived with the equipment. It is not uncommon to find that people at the end of the trial installation have become fully accustomed and quite oblivious to the improved lighting. While every reasonable effort is made to retain the installation in case of cancellation, it is not at all unusual to find that a fulfilled order for removal at the end of thirty days brings the customer back to a full realization of the superior lighting which has been enjoyed. The contrast has often created an immediate voluntary reorder of the fixture or the sale of a fixture at some later date. The likelihood of this occurring is obviously reduced as the time of trial installation is reduced. The least amount of time that may be used has not been reduced to exact figures, inasmuch as this factor has not been subject to extensive research.

In planning the activity it must be remembered that surveys indicate that about one-half of the people are living in rented homes. These people will often consider the activity unsuited to their conditions. Fixtures have been sold to renters by extending the trial installation to these people the same as to the people owning their homes. Furthermore, the central station agrees to rehang the new fixture in the event that the purchaser moves within one year. The old fixture is wrapped for storage. These latter two offers are to be made at no additional cost to the customer. Some sales have been made without this offer, but the offer is considered a very important sales aid.

Survey Method

One method, requiring the surveying of the wiring and lighting of the home called on, possesses merit which deserves attention. Survey cards with spaces for the number and kinds of fixtures, portable lamps, lamp bulbs and convenience-outlets in each of the principal rooms of the home are carried by the solicitors. This affords an opportunity for the solicitor or the lighting department to make complete recommendations for the relighting of the home. Aside from this, these cards, when filled, afford an excellent reference for determining the most profitable future activities to be undertaken. It must be borne in mind that this method reduces the number of calls which the solicitor can make. For this reason adjustment in the salesmen's compensation has been made for the information obtained.

Salesmen's territories, quotas, commissions and bonuses should be established in advance and should be adhered to strictly. Variations in quotas between different groups of the sales organizations are often found necessary in the original plan due to variations in livelihood and density of population in the respective territories. While the possible number of calls a day per salesman may vary, it has not been unreasonable to assume that fifteen calls can be made. These are to be made from a properly selected list with credit standing assured. With a thirty-day activity planned, each salesman should report on from approximately 300 to 400 customers. From past experiences with well-organized activities directed to well selected lists, it is not unusual to find from 25 to 35 per cent of the customers called on were sold. Knowing the number of salesmen actively participating in the activity, it is possible for the manager to not only establish quotas, but also to have some idea of the size of the order to place with the manufacturer supplying the lighting equipment.

Compensation

The sales force is usually dependent on commissions for income, although a small salary in addition is not uncommon. Whatever the commission, although it is higher than that on regular appliance sales, it should be based on an adequate income for good work and should be as nearly comparable as possible per month with that obtained from activities on other merchandise sold. If this is not done, there will be an unsatisfactory reaction against the activity and future lighting activities. Some central stations have compensated their salesmen for both the sale of the unit and the amount of the added wattage as well. This appears both commendable and reasonable when the revenue from just an additional 25-watt lamp in an active socket is considered. On analysis this modest addition can increase the gross revenue $2.50 per year per customer.

An added incentive has been created in some activities by the offering of prizes. However, in general it is not wise to offer a grand prize for the most units sold, as it usually narrows the possible prizewinners down to a few men. Rewards for the attainment of individual quotas have proved to be effective. Prizes for the best showing over different periods during the campaign keep competition alive. This latter arrangement is particularly suitable for the first and last part of the campaign.

One method of simplifying the billing and recording of accepted lighting fixtures which has been on trial is to have the trial order agreement which is signed by the prospective customer read in essence as follows: If, at the end of thirty days, the customer has not requested the removal of fixture, it is understood that the customer is satisfied and that he desires to keep the fixture. A certain sum is to be added to the electric service bill until the total quoted sum has been paid. On the other hand, orders for removal under the thirty-day trial period are to be executed promptly by the central station company and without charge to the customer.

Fixture Hanging

It is very important that installations of all orders be made as soon as possible, preferably within 24 hours after the order is taken. Lack of coordination at this point has proved to be fatal to a number of activities.

The installers of equipment like the employee-group can do tremendous harm as well as work for definite good. Usually contractor-dealers have been called on to supply fixture hangers. Their competence for satisfactory installations is highly desirable. Therefore it is essential that they, and every individual associated with the activity, must know what is being offered, what its desirable points are, what increase in the electric service bill may be encountered, if any, and he must be behind the activity. While this may be somewhat difficult to obtain, from the fixture-hanger group, every effort should be made to obtain it, and, furthermore, checks should be made to maintain it. Negative attitude on the part of the fixture hanger accounts for many cancellations.

The payment for fixture hanging should be liberal enough to make it attractive to the contractor-dealer. The paying of a like amount for the original installation and the removal of the same fixture is to be avoided. Obviously this encourages the fixture-hanger to work for removals. An arrangement of paying more than the usual price for the original installation, with the understanding that no pay for removals will be made, eliminates the previously mentioned danger. Even paying double the usual price for hanging, which would also allow for removal of all fixtures should it be necessary, may be more advisable than the fee split into two parts.

Advertising

Newspaper space which the central station usually has under annual contract should be used to feature all of the important features of the campaign. Teaser advertisements preceding the campaign are to be followed by regular, clean-cut, simple advertising based on the appeal which is most effective in creating interest and an urge to buy. Of course, all of the appropriate appeals should be incorporated where possible, but these should be subordinated to the main issue. At present the best framework upon which to build the advertising is that of being "kind to the eyes," or the conserving of vision. The results obtained from this appeal, and the experiences of the solicitors have been continually adding support to the contention that this appeal possesses merit greater than another appeal taken alone. One group has declared that new fixtures are needed because, artistically, the fixtures in use are out of date; a few have argued that specification fixtures will turn the trick; some have advocated that lighting effect is the thing; and others feel that the story of reducing the burdens in the home is sufficiently convincing. Each of these attacks has been featured more or less to the exclusion of the others, and in practically every case only partial success has resulted. Procrastination on the part of the buyer has to be overcome, and none of these issues taken alone, or even several of them used together, seems to create the urge to act immediately. We cannot think of the home without thinking of children. Their eyes are immature in growth and in function and, therefore, they are readily susceptible to injury and malformation. Near-sightedness, eyestrain, nervousness and other disorders often result from inadequate and improper lighting. These and other similar arguments pertaining to better seeing and to conservation of vision, properly presented, urge immediate action on the part of the householder.

Convincing results have been obtained from certain recent home-relighting activities, of limited duration, based on the eye-conservation appeal.

Company A	5,884	lighting fixtures
Company B	2,546	lighting fixtures
Company C	3,498	lighting fixtures

Obviously a well-planned activity incorporated all of the other arguments.

Newspaper advertising has proved its ability to create interest and sales for relighting in almost every case. A recent test case of its effectiveness in a small community is of interest. The newspaper advertising was run for eight weeks, and at the same time two solicitors were put out in the territory. At first little or no interest could be sensed by the solicitors, and the sales which were made were largely due to their direct efforts. As the program of advertising progressed, the solicitors began to find that the people knew more and more about the relighting story and were more interested. The sales increases from these two solicitors, doubling as it did between the first and eighth week, illustrates the effectiveness of newspaper advertising. Of course, allowance must be made for the accumulated experience of the solicitors between the first and eighth week.

Show-Windows and Stores

Show-window displays and store displays should feature the equipment being sold, its advantages, trial installations, prices, payment plan, etc. Inside of the store demonstration booths should be erected in which the story and the lighting effect may be demonstrated by the store sales force, or even by one person assigned to it. Before and after contrasts are particularly effective in emphasizing improved lighting.

Where there is dealer cooperation on the activity, the cooperating group should be urged to make similar window displays. In many cases the central station has furnished the fixtures for these trims.

Educational Program

Specially trained people appearing before women's clubs to tell the story of better lighting enables the central station to get a more detailed and lasting impression of the importance of lighting before the public than the door-to-door sales force can unaided. A series of such meetings should be conducted before the specific time of the activity both for educational reasons and for the prospect list which can be built from them.

Lamp Shade Classes

Lamp shade classes are unique in creating lighting consciousness. These classes create many new sockets and provide means of obtaining excellent prospect lists. As a builder of good public relations they possess unusual merit.

Lighting School

The education of the sales force requires time and should be included in the general plan.

The educational program or sales school for lighting should immediately precede the activity with no intervening time spent on other merchandise. A typical educational program for the sales force follows.

First Day

Talks by several of the executives to convey the importance of the activity to the sales force.

The present status of wiring and lighting in the average home in your territory.

Luncheon

Better lighting a factor in improved customer relations.

Home lighting recipes.

Eyesight conservation.

Evening of the First Day

General employee meeting.

Inspirational talks on lighting and the campaign which is to follow the next week.

Second Day

How to appraise residence lighting fixtures.

The merits of the fixture which you are going to introduce to the public.

Experiences of other companies in selling better lighting.

Luncheon

The sales plan and quotas.

The advertising program.

Sales aids.

Playlet: "Turning to the Light" to be enacted by employees.

Evening—Banquet

While longer schools have been conducted, they have usually been held previous to two lighting activities; i.e., for commercial lighting and residential lighting. This program is intended primarily to educate; however, it is also the time for the manager of the activity to build up a spirit of enthusiasm for the undertaking.

Lamp Recipes

When the development of residential lighting began, standardization appeared hopeless owing to the variable personal taste. However, with the unfolding of fundamental requirements of convenient and adequate utilitarian lighting, it was found that personal taste is not involved in the principles of lighting recipes, and that it has wide latitude in utilizing them. In other words, the fundamental lighting recipes are the same in a cottage as in a mansion.

Taste has wide range in the choice of proper equipment. Light-users must be taught that good lighting principles are more or less fixed, although they allow a wide latitude of choice and arrangement. Lighting recipes afford a direct means to an end. They have been available for quite a few years, and by no means have they outlived their usefulness. In fact, they are such necessary and very important aids in the development of residential lighting that constant effort is being made to simplify and to extend them.

Lamp recipes—specific lamps for specific purposes—are evolving from the lighting recipes. Where one of these becomes established, confusion disappears and residential lighting makes a permanent advance. For example, one central station operating kitchen-unit campaigns for the last five years has and is selling the 150-watt Mazda daylight lamp for this purpose. During this time this lamp has been termed the "kitchen-unit lamp," and is now recognized as such. By establishing this lamp recipe, a recent survey of the homes on this utility's lines reveals that practically three out of four kitchens having modern lighting are using this lamp instead of the more generally recommended 100-watt inside-frosted lamp. This illustration of the efficacy of the idea is of particular interest when further analyzed. Neither the fact that the 150-watt Mazda daylight lamp at presents costs nearly three times as much as the 100-watt regular lamp, nor the difference of 50 watts, which during a year increases the consumer's bill perhaps 15 per cent, prevented the acceptance of this lamp recipe.

Other lamp recipes in the home can also be stated in terms of utilitarian requirements. As we approach the predominently esthetic application of lighting in the home, the lighting recipes—and, therefore, the lamp recipes—become less standardizable. Finally we have a large field of predominantly esthetic lighting in which personal taste and ideas have full sway.

Many specialized businesses base their development upon the service to be obtained from the product. Lighting recipes and lamp recipes afford the lighting interests a practical means of developing the residential lighting business. This foundation can be built most readily upon utilitarian requirements which these recipes supply. Esthetic aspects need not cause any worry—they will be taken care of in other ways for the time being. Even these as they become more understood and more generally used will evolve to the form of lighting recipes.

Contractor-Dealer Co-operation

As it is imperative to have cooperation from all electrical interests, the contractor-dealer should be included in the plan of activity. Liberal offers for sales, handling of time payments and all reasonable concessions should be made. This has been done repeatedly in all parts of the country, and more active participation on the part of this group is anticipated.

Repeating Relighting Activities

Many central stations entered the field of relighting residences via the kitchen unit, and having conducted one campaign have never re-entered the field. The reasons advanced for the discontinuance of relighting activities generally come down to either of the two following reasons: The activity was not successful and creates poor customer relationships, or the activity was very successful and the job is done. There is plenty of evidence to refute both contentions. For example, one company has repeated the kitchen activity periodically each year until now they have sold over 20,000 units. During the last three years in their sixth, seventh and eighth activities, they have averaged 2000 units per year. Even though relighting in the other rooms of the home has occupied their attention ever since their second campaign, the kitchen unit has never been forsaken. Even now they still have some 40,000 customers that have not been sold. From this it is obvious that a single activity does not conclude the job. By having a specified time on the calendar of each year for relighting, all details of the plan can be established well in advance. This is of real importance, as last minute arrangements leave many openings for trouble both on the inside of the organization and on the outside.

DOMESTIC OIL BURNERS

Scope

The Oil Burner Subcommittee of the General Merchandising Committee was organized in the National Electric Light Association administrative year 1927-28 to make a study in conjunction with a committee of the Oil Heating Institute; "to produce a report covering load factor characteristics, revenue producing value, service requirements, etc., of the oil burners; to conduct engineering and performance tests on different types of burners and to suggest methods of possible cooperation between the oil burner manufacturers and the power companies."

This report is published in the following administrative year by the Merchandise Sales Committee, Commercial National Section, and it is desired to give due credit to the General Merchandising Committee, 1927-28, and its Oil Burner Subcommittee.

The first work undertaken was a survey of all existing information on the subjects listed within the scope of the Committee. The purpose of this survey was to obtain records of what had been done in all phases of the industry, to coordinate the engineering tests which had been previously made; to determine the various methods of merchandising and sales financing either in use or proposed, and to obtain the opinions of various representative men of the industry concerning the general subject.

Sources of Information

The sources from which the information contained in this report was drawn were: American Oil Burner Association, American Petroleum Institute, individual oil heater manufacturers, oil companies (both producers and distributers), heating and ventilating engineers, members of Oil and Gas Section of American Society of Mechanical Engineers, electrical engineers and manufacturers interested in motors and ignition and also in radio interference, a manufacturer of blower fans for hot air furnaces, manufacturers of hot air furnaces, boiler manufacturers, Underwriters' Laboratories and Agencies, National Fire Protection Association, and electric light and power companies.

The cities which were covered by questionnaire letters requesting information, personal visits and published reports include: Atlanta, Ga., Boston, Mass., Chicago, Ill., Cleveland, Ohio, Detroit, Mich., Kansas City, Mo., Louisville, Ky., Minneapolis, Minn., Newark, N. J., New Orleans, La., New York, N. Y., Philadelphia, Pa., Pittsburgh, Pa., Portland, Ore., Salt Lake City, Utah, San Francisco, Cal., and St. Louis, Mo. In addition to the foregoing list, questionnaires were sent to manufacturers located throughout the country.

The data obtained cover in excess of 700 actual burner installations and represent information on the daily, monthly and seasonal electrical load characteristics.

DESCRIPTIVE

Number and Distribution of Domestic Oil Burners

Distribution of Burners

The total number of domestic oil burners in service up to Jan. 1, 1928, is estimated by a representative of the American Oil Burner Association as 304,200. This estimate is based on the "National Survey of Fuel Oil Distribution, 1927," by E. B. Swanson, a joint report of the U. S. Bureau of Mines and the American Petroleum Institute.

The number of burners installed in 1926, according to a survey made in February, 1927, and described in P. E. Fansler's book, "House Heating with Oil Fuel," was 76,964. The American Oil Burner Association estimates that approximately 95,000 were sold during 1926.

Mr. Fansler's total for 1927 was estimated as 15 per cent less than his total for 1926, or approximately 65,400. The estimate by a representative of the American Oil Burner Association for this same year was 85,000. The number of burners sold by twenty-nine companies covered in this report was found to be approximately 64,000.

This value was obtained from the replies to the N. E. L. A. questionnaire direct to the manufacturers. The total number sold by twenty-six of these same manufacturers, also taken from the replies to the questionnaires, was found to be 273,000. The replies to the questionnaire in so far as they applied to number of burners are given in Table I.

Distribution

There is no record available which gives the actual distribution of the various burners. A good idea of the relative distribution may be obtained, however, by comparing the number of dealers in the various parts of the country. The distribution of dealers has been estimated by a representative of the American Oil Burner Association as follows:

1. New England, metropolitan New York and northern New Jersey	33%
2. Pennsylvania, Ohio, southern New Jersey, Delaware, Maryland, Kentucky, Illinois (belt along the Mississippi Valley)	35%
3. West Coast	15%
4. Middle West	17%
	100%

Publication No. 289-8, Serial Report, Merchandise Sales Committee.

TABLE I

NUMBER OF BURNERS SOLD

Name of Burners	1927	Total
A. B. C.	1,700	10,000
Baker	1,500	8,000
Ballard, Jr.	900	1,800
Bettendorf	200	200
Caloroil	616	2,607
Chalmers	100	500
Combustion	1,723	9,494
Commonwealth	300	498
Electrol	3,500–4,000	17–18,000
Fluid Heat	200	319
Gulf	1,700	2,500
Hardinge	2,000–3,000	*9,000
Hart	2,000	11,000
Johnson	5,150	47,500
*Kleen Heat	2,400	*28,000
Lammert & Mann	1,000	3,000
Marr	600	5,000
McIlvaine	200	600
Nokol-Aetna	6,000	45,000
Nu-Way	1,500	5,000
Oil-O-Matic	15,000	60–70,000
*Petro	1,000	3,100
Quiet May	3,912	10,000
Ray	*4,100	45,000
Rickard	150	200
Silent Automatic	5,000	13,000
Super Oil Heator	2,000	5–6,000
Sword	650	2,200
Timken-Detroit-Socony	2,750	9,000
Torridheat	518	2,000
Wayne	1,000	3,000

Types of Boilers and Furnaces

The boilers and furnaces used in domestic heating may all be included under three main classifications: Hot water, steam and hot air. The number of types of boilers and furnaces which come under these three main classifications is very large. The classification including hot water boilers is probably the most specific of the three main classifications, as all hot water installations are based on the A. S. M. E. Boiler Construction Code, a standard code which has been in use since 1912. This code also covers steam boilers, but there are several types of boilers, such as the vapor, low, medium and the high pressure types. In both steam and hot water systems there are, of course, the usual differences due to individual design and also to the gradual improvements of any particular design, but there are, however, many features which are common to the class. In the case of hot air furnaces this is not generally the case. Until very recently there has been no standard code covering the design of domestic furnaces. In many installations the local dealer has designed and assembled the type of furnace which, in his estimation, best fitted the case. While the interior, the metal castings and metal frames may be made by a national manufacturer, it would be hard to recognize some of these castings installed in furnaces designed by the local heating man. This condition is, however, now correcting itself as there has been recently adopted a code which covers the design of domestic furnaces and is intended to be used as a supplement to the "Standard Code for Warm Air Furnaces" which covers the installation.

Types of Oil Burners

Classification of Burners—Natural Draft Type

There are many ways of classifying oil burners, but the two methods which are the most common differentiate as to whether the oil is vaporized or atomized and whether the draft is mechanical or natural (atmospheric). The natural draft burners are practically all based on the same general principles. The flow of oil to the burner is adjusted by means of a valve, usually of the needle type, and is fed into the combustion chamber, where it is vaporized by the application of heat. The air necessary for combustion is drawn into the chamber by the suction created by the natural draft of the chimney and the rising of the heated gases after combustion. In the majority of atmospheric burners it is necessary to control the amount of heat and to ignite the oil manually, but safety devices may be obtained which will shut off the supply of oil after combustion has ceased. In general it is necessary to manually reset these devices after they have once operated. Any attempt to force the atmospheric type of burner beyond its limited capacity, without some special means for providing excess air, meets with results that are unsatisfactory. Incomplete combustion, which is indicated by smoke, soot and low efficiency, is a natural consequence.

In some instances the straight atmospheric type is modified by the provision of a blower for mechanically inducing a draft to be used when it is necessary to force combustion. The principles of combustion remain the same, the blower merely provides the necessary air to burn more oil and thus force the heating system. It would be just as inefficient to operate the blower with a limited amount of oil as it would be to provide an excess of oil without the necessary air for complete combustion.

Mechanical Draft Type

The mechanical draft classification is the most important; it includes three specific types of drafts: (1) the draft caused by an independent fan or blower, similar to the one used in connection with the atmospheric type of burner; (2) the draft caused by air furnished by the burner in excess of that needed for atomization, but necessary for complete combustion; (3) the draft caused by the burner itself in the process of atomization. There has been an effort to have this third type of draft included among the main classifications as a mechanically induced draft.

Types of Control

The four types of control which are quite common may be classified as follows:

1. Manual Control—This provides for manual heat control, ignition and extinguishment; it may, however, include safety devices which require manual resetting after operation.
2. Semi-Automatic Control—This includes either a room temperature control (some form of thermostat) or some form of pressure control. The burner is usually manually ignited and extinguished.

3. Full-Automatic Control—This includes some form of automatic temperature or pressure control and also provides for automatic ignition and extinguishment.
4. There is also available a refinement of the full-automatic control provided by a master control clock, which will automatically start the burner at predetermined times if heat is necessary, and also stop the burner regardless of temperature. This master control clock is not usually supplied with the original full automatic equipment.

Types of Ignition

The different types of ignition used in connection with mechanical draft burners may be broadly classified as gas pilot, electrical arc, combination gas-electric and manual. The manually operated types constitute a relatively small amount of the total. There are two types of gas pilots, the constant flame and the expanding flame; both are located in the combustion chamber and are designed to burn continuously when the burner is in operation. In the constant type the flame is uniform throughout operation; in the expanding type the flame is small when the burner is not operating and enlarges during the period of operation. The electrically ignited types may be classified as temporary and continuous. The temporary type operates a few seconds, starting just before the oil is injected into the burner and continues until ignition has taken place. The continuous type starts just before the oil enters the combustion chamber and continues until the burner is extinguished and the oil supply shut off. In the combination gas-electric ignition an electric spark ignites a gas burner, the gas flame in turn ignites the oil. This method eliminates the necessity of a continuous gas flame. There is a marked difference in opinion concerning the advantages and disadvantages of the gas, gas-electric and electric types of ignition.

Types of Oil Fuels

The grades of oil which are generally used in domestic burners are now referred to as "Furnace Oil-Light" or "Oil No. 1"; "Furnace Oil-Medium" or "Oil No. 2"; "Furnace Oil-Heavy" or "Oil No. 3"; "Fuel Oil-Light" or "Oil No. 4." "Fuel Oil-Medium" or "Oil No. 5", and "Fuel Oil-Heavy" or "Oil No. 6" are not as yet in common use in the domestic field, although there is a tendency toward consideration of the heavier oils by the designers of the various burners. (The numbers used in connection with the types of oil refer to the number given the oil in the specifications recently adopted by the American Oil Burner Association, and which are now used by the Underwriters' Laboratories in their standard listing.) The new specifications are given in detail in Appendix A of this Report.

Until recently the gravity of the oil has been the chief consideration in the selection of oil fuel, the different types being classified as "Furnace Oil" 36-40 deg. Baumé, "Light Fuel Oil" 28-32 deg. Baumé and "Diesel Oil" 25-27 deg. Baumé. The need for further definite classification first appeared in the so-called "Diesel Oil Classification" where viscosities were specified varying from 45 to 75 seconds (Saybolt Universal at 100 deg. fahr.) for the different burners.

The groups into which the new specifications divide with respect to specific gravity, as listed by Underwriters' Laboratories, are included in Table II.

TABLE II

GRADES OF OIL

New	Old
Oil No. 1	36-40° Baumé
Oil No. 2	32-36° Baumé
Oil No. 3	28-32° Baumé and Special 25° Baumé Pacific Coast Diesel Oil
Oil No. 4	24-26° Baumé
Oil No. 5	18-20° Baumé or U. S. Gov't Bunker Fuel Oil "B"
Oil No. 6	10-18° Baumé or U. S. Gov't Bunker Fuel Oil "C"

The relation of the specific gravity to the heat content of the oil has been compiled by H. F. Tapp of the American Oil Burner Association and is plotted in Fig. 1. for various grades of oil.

The fact that the requirements for the different burners vary from Oil No. 1 to Oil No. 4 does not mean that the burner designed for Oil No. 1 will burn oil No. 4 with equal satisfaction. Since all tests to determine the hazard involved in the use of particular burners are based on a particular grade of oil, consideration should be given to the oil furnished to a burner. The oil for which each burner is listed may be found in the Underwriters' Laboratories current list of Inspected Oil Burners, a copy of which may be obtained from Underwriters' Laboratories, 207 East Ohio Street, Chicago, Ill.

Types of Oil Tanks

The size of tanks used in domestic installations was found to vary from 275 to 2000 gal. The smaller sizes are usually delivered to the installation completely assembled, while the larger sizes are sometimes built up and electrically welded on the premises.

The capacity of the largest exposed tank allowed within a building at present by the "Regulations of the National Board of Fire Underwriters for the Construction and Installation of Oil Burning Equipments and for the Storage and Use of Oil Fuels in Connection Therewith," is 275 gal. The use of this tank makes the whole installation easy to install or remove, and, therefore, makes a desirable installation for the tenant as well as the home owner. The larger tanks are sometimes buried in the yard and other times under the cement floor of the cellar. When buried in the yard the assembled tank is generally used; when buried under the cellar floor the use of the built up tank is more common. The larger tanks are generally advocated by oil companies as they reduce the possibility of emergency calls due to lack of oil. They also allow the delivery of a full tank-truck load and reduce the possibility of overfilling and its attendant evils. However, in thickly

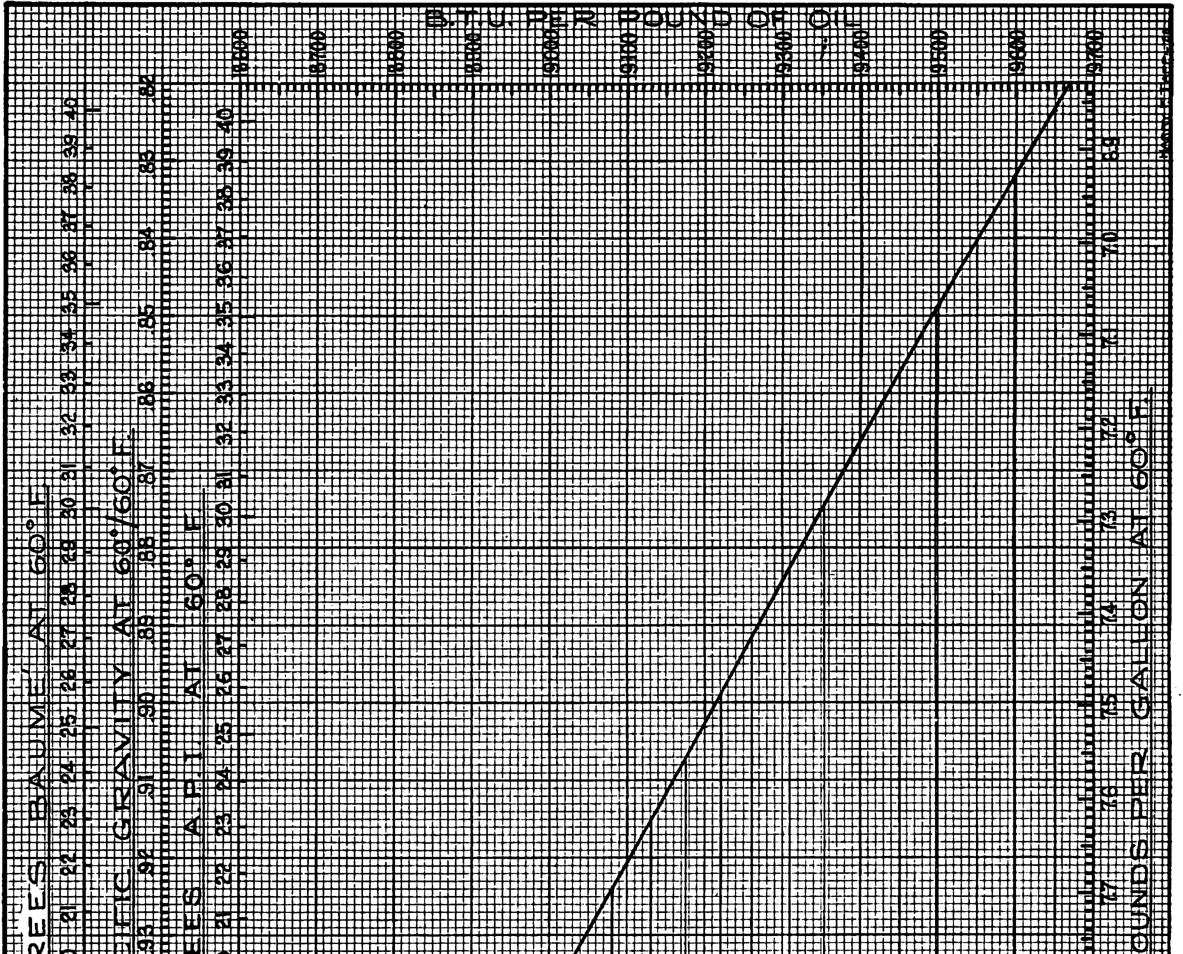

FIG. 1—SPECIFIC GRAVITY—HEAT CONTENT.

settled communities oil companies are establishing regular delivery service which makes the inside tank entirely satisfactory. The actual size of the tank should depend largely upon local conditions and ordinances.

Sizes and Types of Individual Motors

The motors used in the various types of oil burners vary in size from 1/20 to 10 h.p., this range includes the smallest motor used for domestic heating and the larger ones used for industrial heating. It has been estimated that 95 per cent of the domestic motors do not exceed ¼ h.p. Various surveys made in the past two or three years indicate that ¼ h.p. is the average size. The data collected in this survey indicate that the general average will be somewhat smaller for the past year. Current practice as indicated by the replies to the Committee's questionnaire to manufacturers is given in Table III.

TABLE III

MOTOR TYPES AND SIZES

Practical Considerations in the Application of Oil Heat to Hot Water, Steam and Hot Air Boilers and Furnaces

One of the primary difficulties which is confronted in existing heating plants is that the installed radiation (the size or number of radiators or registers) is not, in many cases, sufficient to heat the house when the temperature of the radiators or hot air registers are at normal values. The radiator must, therefore, be overheated or the hot air excessively warm in order to furnish the necessary heat. The boiler or furnace may also have to be forced in order to furnish the necessary temperature at the radiator or register. When a boiler or furnace is forced beyond its capacity there is reduction in efficiency. The design of many boilers or furnaces makes them unsuitable for oil heating, and in some instances it is undesirable to install a burner in such an installation. There are also instances where particular types of burners are especially suitable for certain types of installations. This is exemplified by those companies who handle more than one make of burner in order to obtain better efficiency from the existing installations.

In the case of steam or hot water it is sometimes possible to increase the boiler capacity beyond its capacity as a coal burner by the intense application of the oil burner flame in the available area. This has sometimes led to the assumption that in any unsatisfactory heating plant an oil heater will correct the difficulty. This is not always the case. A careful survey should be made of the existing installation and the amount of radiation should be checked with standard practice in each case.

The application of oil heat to hot air systems is a problem in itself, and many additional factors not important in steam and water problems, must be considered to obtain good efficiency. Hot air furnaces will not stand an indefinite amount of heat without some provision to insure a very rapid circulation of the air. If the burner is improperly installed in the ashpit, unsatisfactory results are probable. This is due to the fact that the burner will heat the cold air intake and thus prevent the free passage of cold air to the furnace. This may be overcome, however, by the use of suitable baffles in the furnace or by the insertion of a forced air fan in the cold air supply. Great care should be taken to prevent the overheating of the furnace, for if it has become overheated there is always more or less leakage through the combustion chamber to the hot air supply. This also applies to the installation of a burner in an old furnace in which case the furnace should be overhauled if there is any question of its ever having been overheated. The 1928 Handbook of Domestic Oil Heating shows the proper method of installing a burner in a warm air furnace.

Present Status of the Development of Oil Burners

For several years the Underwriters' Laboratories of Chicago (an institution established and maintained by the National Board of Fire Underwriters for the purpose of rating the fire, accident and casualty hazards of various devices) have made a study of the hazards involved in the domestic oil burner, and they now regularly certify types submitted to them. The procedure followed by the laboratories contemplates that a burner will be sent to them for examination and test, and if the device is found to be satisfactory or if the hazard involved has been reduced to a satisfactory degree, a permit to attach the laboratories approval label to the devices will be issued to the manufacturer. Within the last year and a half the cases where, with the exception of a few technicalities, heaters did not comply with the existing requirements the first time they were submitted, have been the exception rather than the general rule. Another index of the state of development of the heaters is evidenced by the fact that of more than one hundred commercial makes of burners, only eight have been removed from the list in the last year and these eight were removed on account of discontinuance of manufacture. In order to remain on the approved list it is necessary for the manufacturer to maintain his standards of production so that the finished product is at least as good as the sample submitted to the laboratories.

The test requirements of the laboratories have now been definitely established so that all burners are given an equal test. These requirements include the operation of the burner, in accord with the published instructions and with the recommended grade of oil, for a period of from four to five weeks. The Underwriters' Laboratories have issued a very interesting booklet showing the actual test installations of various burners and also describing the testing and proper installation of domestic oil burners for safety. This booklet may be obtained direct from the Underwriters' Laboratories, 207 East Ohio Street, Chicago, Ill.

The National Board of Fire Underwriters published in 1925 the "Regulations for the Construction and Installation of Oil Burning Equipments and for the Storage and Use of Oil Fuels in Connection Therewith."* This booklet gives the rules which should be adhered to in order to prevent any undue hazard being caused by the burner or its equipment. A complete list of inspected oil burners may be obtained from Underwriters' Laboratories, 207 East Ohio Street, Chicago, Ill.

---

* These regulations are now being revised and the 1928 edition will be issued shortly.

TEST METHODS AND RESULTS

Electrical Characteristics

In obtaining data for the daily, monthly and yearly load curves, recording meters and standard watt-hour meters were used. In one instance an index of yearly load curve was obtained from differences in consumption of specific residences for corresponding periods of nine months before and after the installation of the burner.

In making this survey the current required for starting the motors was not considered, as a joint committee of interested parties, including the National Electric Light Association, had already reached substantial agreement covering this subject. The new specifications were published in the *Electrical World* and are reproduced herein as Appendix D.

The Degree Day Method

It is a fact that the amount of coal, oil, gas or electricity required to heat a given house is dependent on the temperature maintained within the house and that existing outside. Since the amount of oil delivered to the burner is generally fixed, the interval of operation would largely depend on the relative temperatures; in other words, if the outside temperature is lower, more heat will be required and the burner would therefore operate a greater proportion of the time. The electrical consumption of a burner is practically constant, and since the number of operating hours depends on the temperature, it follows that this consumption would be a function of the temperature. On this basis the electrical consumption was checked against the heat required in a large number of installations, and it was found that it was in all cases practically proportional to the heat required. The unit of heat which was used in this comparison is known as the "degree day," and is exactly what the name implies, *i.e.,* 1 deg. for a period of 24 hours, or one day.

The temperature at which artificial heat is required was taken at 65 deg., in accord with the recent finding of the American Gas Association, which stated that if the heat supply was not automatic, the average person in the United States would manually operate some heater at this temperature. Having established the temperature of 65 deg. fahr. as a standard basis, the number of degree days required in any month was found by subtracting the average mean temperature for any month from 65 deg. if it does not exceed this value, and multiplying the remainder by the number of days in a month. For example, in Denver, Colo., the average mean temperature for the month of January, 1927, was 35.2 deg. fahr., subtracting this value from 65 we have 29.8 deg. and multiplying this by 31 (the number of days in a month) we have 923.8 deg. days for January. This degree-day method makes it possible to compare the heat required in a given installation when located in any part of the country in which accurate temperature records have been kept. It is therefore apparent that tests made in any locality, which include a detailed description of the exposure, construction, condition of the house, condition of heating plant, installed radiation, required radiation, radiation of boiler or furnace and a general description of the various factors which influence the radiation required, may be readily applied to any other locality with absolute assurance of comparable results.

General Results

The interval of operation of the burner is dependent on the setting of the thermostat, the construction and exposure of the house, and in some cases where the radiation is either greater or less than that required, this also is an important factor. The best condition from the standpoint of general efficiency occurs when the burner operates approximately twenty minutes on and twenty minutes off during the heating hours in the severest weather. The variation in temperature under these conditions should never exceed plus or minus 2 deg. fahr. Burners are often set to operate at 50 deg. fahr. from 11 P. M. to 6 A. M., although in some instances uniform heat is maintained during day and night.

The average load drawn by typical burners during operating periods was found to vary from 100 to 350 watts. The peak load in general occurs between 6 and 8 in the morning and tends to flatten out during the day. The total consumption varies with the geographical location of the installation and, other things being equal, is dependent on the temperature maintained within and that existing without.

The average monthly and yearly consumption in kilowatt-hours, as obtained by the methods described previously under electrical characteristics in Detroit, Kansas City, Minneapolis, Philadelphia and New York are given in Table IV. The table also

TABLE IV

KW-HR. CONSUMPTION

Location	Number of Burners	Average Monthly Consumption Kw-hr.	Average Yearly Consumption Kw-hr.
Detroit	205 (1927)	....	258
Philadelphia	301 (1927)	....	424
Kansas City	21 (1925)	....	194
Kansas City	20 (1926)	....	177
Minneapolis	35	43.*	386
New York	....	41.1	329**
General	....	57.1	456†

*The kw-hr. consumption of these burners was determined by subtracting the total energy used for a period of nine months previous to the installation of the oil burner from the total energy used for the same period subsequent to the installation of the burner. This method, would have a tendency to give values somewhat in excess of that actually used, as it is possible that these same installations have added some other appliances during the period.

**The total yearly consumption is based on an eight months heating period. The average consumption was obtained from monthly bills.

†This value was calculated from data furnished by a representative of the Oil Burner Association and is based on a heating period of eight months.

includes the estimated average monthly consumption for the country at large compiled from data furnished by a representative of the American Oil Burner Association.

Individual Test Results

Detroit

In Detroit, integrating watt-hour meters were installed on 55 oil burners. The results of a year's operation were published in an article by H. A. Snow in the *Electrical World* Jan. 21, 1928.

Fig. 2 is the daily load curve of 1000 oil burners based on the average of the 55 burners tested. It will be observed that the peak of this curve occurs between the hours of 6 and 8.

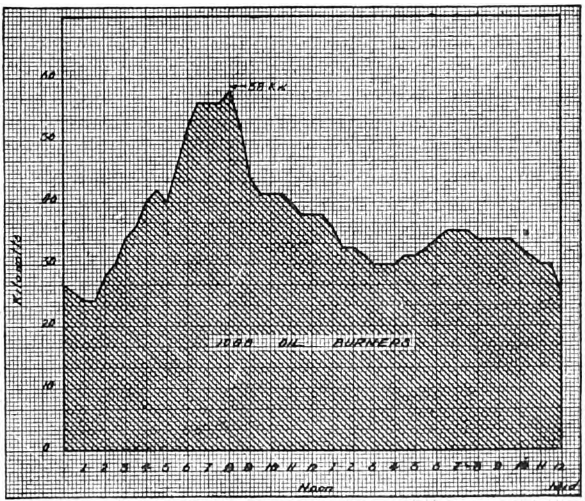

FIG. 2—DAILY LOAD CURVE 1000 OIL BURNERS—DETROIT.

Fig. 3 shows the yearly distribution of the load for an average oil burner based on the results of the tests made on the 55. The annual load factor for a single oil burner was found by Mr. Snow to be 17.1 per cent and the load factor for a large group was found to be 25.4 per cent. The increase being due to the intermeshing of the demands of the individual machines.

Fig. 4 shows the number of degree days required for each month and the percentage of coal, oil and gas which should be consumed for any given month in 1927. This figure was based on the degree day method assuming a temperature of 65 deg. fahr.

In Fig. 5 the solid curve is the number of degree days plotted against the months. The dash curve is the kilowatt-hour consumption for the 55 burners test plotted against the months.

Buffalo

Test work was conducted from March 28 to April 16 on two burners located in Buffalo. The kilowatt-hour consumption for each day during this period is plotted for the two different burners in Fig. 6. Fig. 7 is the degree day curve for the corresponding period. The values in Fig. 6 were obtained by means of a recording watt-hr. meter. The values used in computing the degree days in Fig. 7 were obtained from recording thermometers. Fig. 8 is the degree day distribution for the city of Buffalo in 1927. It also gives the percentage fuel distribution for the entire year. Applying the fuel distribution (as given in Fig. 8) to the kilowatt-hour consumption during the test period, the yearly kilowatt-hour consumption for these two installations has been derived and is plotted in Fig. 9. It will be noted that in these two installations the consumption of one burner is approximately twice the other. The values used in curve 2 of Fig. 6 are approximately double those used in curve 1. Curve 2 in Fig. 6 follows the curve in Fig. 7 a little closer than curve 1, and in examining the charts from the recording meters it was found that burner 2 operated at shorter intervals than burner 1. In some instances burner 2 operated as many as five times while burner 1 was operating continuously. In checking the description of the two installations it was found that installation No. 2 was exposed on four sides and the house was of stucco, while installation No. 1 was exposed only on the front and rear, there being houses on both sides, and was of a frame shingle construction.

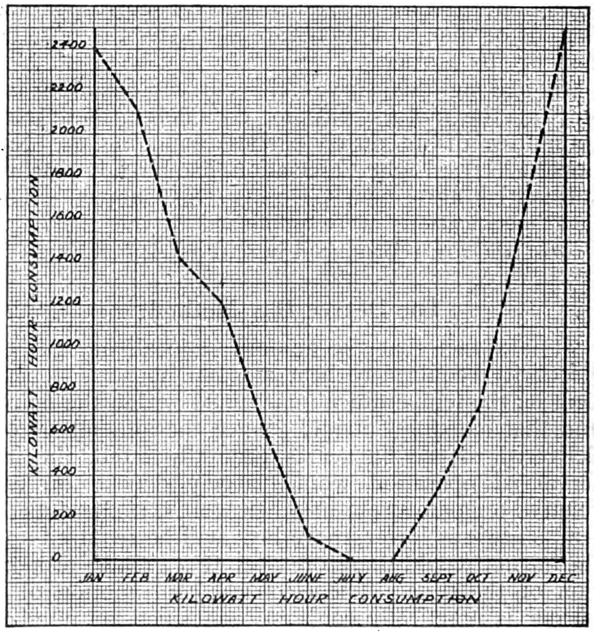

FIG. 3—YEARLY LOAD CURVE AVERAGE BURNER—DETROIT.

The size of the burner is apparently correct in each instance. The house exposed on four sides

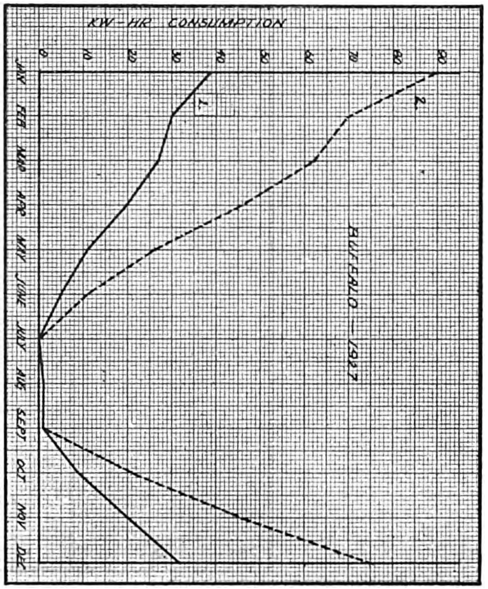

FIG. 9—COMPUTED YEARLY CONSUMPTION TEST BURNERS—BUFFALO.

would naturally dissipate heat faster unless especially insulated, and would therefore follow the changes in temperature more closely. A brief description of the two installations follows:

INSTALLATION No. 1

1. *Motor*

(a) Mfrs. name and type.....	Westinghouse OAH
(b) Rating	⅛ h.p., 2.6 amp., 25 cycle, 1140 r.p.m., 110 volt

2. *Heating System*

(a) Maker's name, type and serial number	American Radiator, Arco Ideal, No. 425-W
(b) Rating in sq. ft. of radiation surface	1575 sq. ft.
(c) Hot air, steam or hot water.	Hot water
1. Size and shape of fire box	25 in. diameter, round
2. Relative position of burner in fire box	Center, level of grate
3. Path of flue gas (from fire box to chimney) ...	Up, see pamphlet
4. General characteristics of boiler and furnace	Round, water boiler

3. *Description of House*

(a) A brief description of the house used in the test, including:	
1. Materials and quality of construction	Frame, shingle
2. General exposure	Front and rear (houses on both sides)
3. Approximate per cent of outside watts occupied by doors and windows	17.3 per cent
4. Approximate total cu. ft. heated	16,000 cu. ft.

INSTALLATION No. 2

1. *Motor*

(a) Mfrs. name and type	Special R S A
(b) Rating	¼ h.p., 4 amp., 350 watt, 25 cycle, 1500 r.p.m., 110 volt

2. *Heating System*
   (a) Maker's name, type and serial number .... Heggie-Simplex Boiler Co., Size No. 303, Serial No. 4598
   (b) Rating in sq. ft. of radiation surface .... 1050 sq. ft. of steam
   (c) Hot air, steam or hot water. Steam (vapor type)
      1. Size and shape of fire box .... 42 in. x 30 in. x 22 in.
      2. Relative position of burner in fire box .... rear-bottom

3. *Description of House*
   (a) A brief description of the house used in the test, including:
      1. Materials and quality of construction .... Stucco
      2. General exposure .... Four sides, no nearby houses
      3. Approximate per cent of outside walls occupied by doors and windows...... 16.5 per cent
      4. Approximate total cu. ft. heated .... 24,600 cu. ft.

Philadelphia

Table V gives the results of a 50 day test on one burner located in Philadelphia. This test was made under the direction of the Philadelphia Electric Co. in 1926, the results being published in the July 3, 1926, issue of the *Electrical World*. The detailed description of the test, including methods, results and costs may be found in Appendix B of this report.

Fig. 10 gives the degree days and also the per cent of the total fuel for each month for Philadelphia, based on the degree day method.

Fig. 11 gives the kilowatt-hour distribution for a normal year. It is based on a total consumption of 424 kw-hr., which was obtained from the records of the Philadelphia Electric Co. The distribution was obtained by means of the degree day method.

Kansas City

Table VI gives the kilowatt-hour consumption for twenty oil burner installations in Kansas City and also includes the number of rooms in each installation. This table is the result of a survey made by C. F. Foley, vice-president of the Kansas City Light & Power Company, and published in the April 24, 1926, issue of the *Electrical World*. The values in this table are plotted as the dash curve in Fig. 12. The solid curve in this figure is the degree day curve which was plotted from the values obtained in Fig. 13. The dash curve does not follow the solid curve exactly but is of the same general shape. This is probably due to the fact that the normal temperature was used in the calculations instead of the actual temperature for the year 1925.

St. Louis

Fig. 14, 15 and 16 show the average steam required for days in October, December and March. These curves were published in the June 3, 1926, issue of the *Electrical World* by Warren L. Berry of the Union Electric Light & Power Company, St. Louis, under the caption "Analyzing Steam Heat Requirements." We have shown previously that the kilowatt-hour consumption is proportional to the amount of heat required. These curves, therefore, represent the distribution of the kilowatt-hour as well as the steam consumption. The installations covered by these curves are mostly hotels and office buildings. It will be noted that the peak occurs between the hours of 7:30 and 9:30 in October, 7:30 and 9 in December and 7:30 and 9 in March. This peak is somewhat later than that shown by Mr. Snow in Detroit, but is exactly what would be expected. The domestic peak would naturally occur somewhat earlier than the more or less industrial peak. The curves, however, give a general indication of the distribution to be expected.

Fig. 17 to 28 inclusive contain the degree day

curves of the following cities: Atlanta, Boston, Chicago, Cincinnati, Denver, Minneapolis, New Orleans, San Antonio, San Francisco, Seattle, Spokane and St. Louis.

The large curves give the percentage fuel required for each month based upon the degree day method of computation. If the kilowatt-hour consumption can be obtained for a given installation by means of a test of comparatively short duration the total yearly consumption may be computed in any of the cities by means of these curves. The insert curve in each case gives the yearly distribution in a normal year.

Overall Fuel Efficiency

There are many factors which must be considered in judging overall efficiency of the system. The rating of the furnace or boiler is one of the most important; if the boiler or furnace is too small the efficiency will be greatly reduced, whereas if it is excessively large it will also be reduced. The size of radiators is another important factor. The condition and construction of the house, whether or not it is insulated, also have important bearing. The condition, particular design, shape, etc., of the boiler or furnace must also be considered. The human element involved in the selection and installation of the burner is also important. In one particular instance the fuel consumption was reduced from 2000 gal. a year to 900 by the installation of a forced air fan and proper baffles to accelerate the passage of air, and to prevent the direct passage of the gases of combustion to the flue.

The location of the house, its exposure and the number of air changes per day or hour must also be taken into consideration.

One of the primary reasons of incorrect size of radiators or boilers has been the lack of standard values for the radiating properties of glass, wood, etc.

Due to the foregoing, the overall efficiency based on the radiation actually installed is entirely different from that based on the radiation required when figured in accord with the standard practice.

Combustion Efficiency

The combustion efficiency with a given oil burner depends on the particular boiler or furnace in which it is installed. Boiler and oil burner manufacturers have both made many tests to determine the most efficient combinations of burners and boilers. The results of tests made by a boiler manufacturer show that the efficiencies of the first ten burners when correctly installed in suitable boilers will not vary over 5 per cent. The tests have been carried to a point where it is now safe to assume that the efficiencies for the majority of the listed burners will not vary more than 15 per cent. These figures have been reviewed by representatives of the oil companies, and of the oil burner manufacturers, and it was agreed by all that the maximum variation was within 15 per cent. The tests made by the boiler manufacturers are probably the most unbiased, as they have no particular interest in any burner. The tests made by the oil burner manufacturers would naturally be more or less biased, even if an attempt was made to treat the subject in a fair way. It is possible to obtain the test results of the individual burner manufacturers for their own particular burners.

The research department of a popular scientific publication has attempted to make various combustion tests on all leading burners, and has even gone so far as to recommend certain burners to people located in different localities. Its recommendations are not based wholly upon combustion efficiency, but take into consideration such things as available service, character of dealer and financial backing of the manufacturer.

The interval of operation of the intermittent type burner also affects its combustion efficiency. The ideal setting from a standpoint of general efficiency is when the burner operates 20 min. on and 20 min. off. Fig. 29, prepared by P. E. Fansler of the *Heating and Ventilating Magazine*, and published in his book on "House Heating with Oil" illustrates this point very clearly.

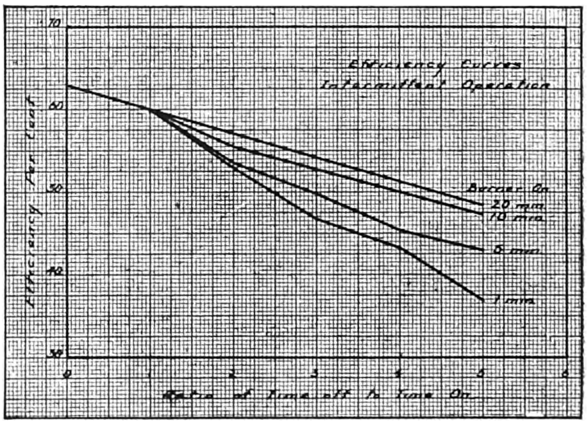

FIG. 29—EFFICIENCY CURVES INTERMITTENT OPERATION.

The human element is another important factor in combustion efficiency. Too great emphasis cannot be placed on the need of an expert adjuster for the burners. In one particular instance a burner was installed and operated very satisfactorily. The owner of the house (a mechanical engineer) became curious in regard to the CO_2 content of the flue gas. He therefore had one of the engineers from his plant make an orsat test and obtained a reading of 5. On the basis of this test he called the oil burner dealer, and while the engineer was there various adjustments were made in the burner and the orsat test reading for CO_2 was increased to 10. If this particular owner had not become curious he would have continued to pay an appreciable amount for heat going up the chimney in flue gas.

Combustion versus Overall Fuel Efficiency

As has been previously pointed out, the maximum variance in combustion efficiency with different burners is not in excess of 15 per cent. The overall fuel efficiency varies as much as 300 per cent. The figures obtained from data on 265 burners located in Louisville show that the gallons per degree day per thousand feet of steam radiation vary from 0.4 to 1.25 with an average of 0.7. The maximum effect of the 15 per cent difference in combustion efficiency as compared with the 300 per cent difference in overall fuel efficiency would be 5 per cent. The difference between the efficiency of the first 10 burners as compared to the difference in overall efficiency would be approximately 1.66 per cent. It is, therefore, apparent that under existing conditions the difference in the combustion efficiency is a negligible factor as compared to the overall efficiency. Therefore, any laboratory tests made in connection with the combustion efficiency of the burners would be of comparatively little importance.

Inasmuch as the greatest use of oil burners is in existing installations, it would seem that the efficiency should be considered when based on the installed radiation. If the oil burner is to be installed in a new house with proper radiation, or in a house in which the existing installation has been changed to meet present requirements, the installed radiation and the required radiation will, of course, be the same.

This is an important question in that the practice followed in the installation of gas heaters takes into consideration the required radiation, and in the majority of cases requires that the radiation be at least equivalent to the required radiation. This practice gives the gas installations a better efficiency, and even though it may reduce the actual number of sales, it reduces the number of high bill complaints thereby building up customer good-will. Before an oil burner installation is undertaken, careful consideration should be given to the suitability of the heating system as a whole.

FACTORS WHICH SHOULD BE CONSIDERED IN COMPARING COAL, OIL, GAS AND ELECTRIC HEATERS

The common practice of judging the cost of house heating by the amount paid for oil, coal, gas or electricity leads in many instances to erroneous results, as there are other costs which often equal or exceed the cost of the fuel.

The cost of house heating may be divided into the fixed charges and the operating charges. The fixed charges include depreciation, interest on investment, heating plant insurance and taxes. The operating charges include cost of upkeep on equipment and installation; labor or service charge and fuel charge.

In order to compute the fixed charges the cost of the installation as well as the average life of the component parts must be known. The life and cost of the heating system, with the exception of boiler or furnace and special equipment required for the particular fuel, is independent of the kind of fuel. In a comparison of the costs of heating, the fixed charges which depend on the type of fuel used include the cost of the boiler, and the cost of any other additional equipment which will be required for use in connection with the particular fuel. A survey made three years ago indicated that the average life of the domestic oil burner was ten years, while the average life of a coal boiler was twenty-five years. Since that time improvements and refinements have been made in the construction of the oil burner and the average life has undoubtedly been increased.

The operating charges, with the exception of the fuel costs are more difficult to obtain. An accurate basis for computing upkeep will only be available after records have been kept for long periods of time. In the same survey which is mentioned in the preceding paragraph instances were encountered where the upkeep was in excess of 10 per cent of the cost of the oil burner, while in the case of the coal burning equipment it was found to be 0.5 per cent of the cost of the installation. The refinements and improvements in the oil burner will, of course, lower this figure, but the nature of the two systems makes it unlikely that the upkeep for the oil installation will ever approach the figure for the hand fired coal installation. (The coal installations considered in this paragraph were all hand fired.) The labor or service charges, which include the tending of the furnace, the removal of ashes, etc., are often neglected as the home owner or some member of the family often performs this task. Even though the duties are performed by the owner, the time which it requires might be spent in remunerative work or recreation, and a certain charge is, therefore, justified.

The features which should be considered in addition to cost in dollars and cents include: Cleanliness, convenience and reliability. The average home owner is interested in obtaining clean, uniform heat at all times at a reasonable cost. In the cases of oil and coal the competition is between automatic control and a furnace man, either electric or human. The reliability of the human furnace man is, in some instances, highly questionable, and his ability to maintain a uniform temperature is even more questionable. In some communities it is also practically impossible to obtain the necessary labor for firing the coal and removing the ashes. There are automatic devices which utilize the smaller sizes of anthracite coal. They are provided with a container which is filled once a day. Once this container is filled, the machine does the rest, delivering the ashes to a second container ready for removal. It has the advantage that uniform heat is maintained with a minimum of attention; however, the coal must be handled and the ashes removed from the cellar. On the surface it would, therefore, appear that the automatically controlled oil burner, which does not require the handling of any fuel or ashes, would offer inducements that would not be obtained from coal. However, a most important consideration in the selection of automatic oil heat is the assurance of immediate service in case of failure or unsatisfactory opera-

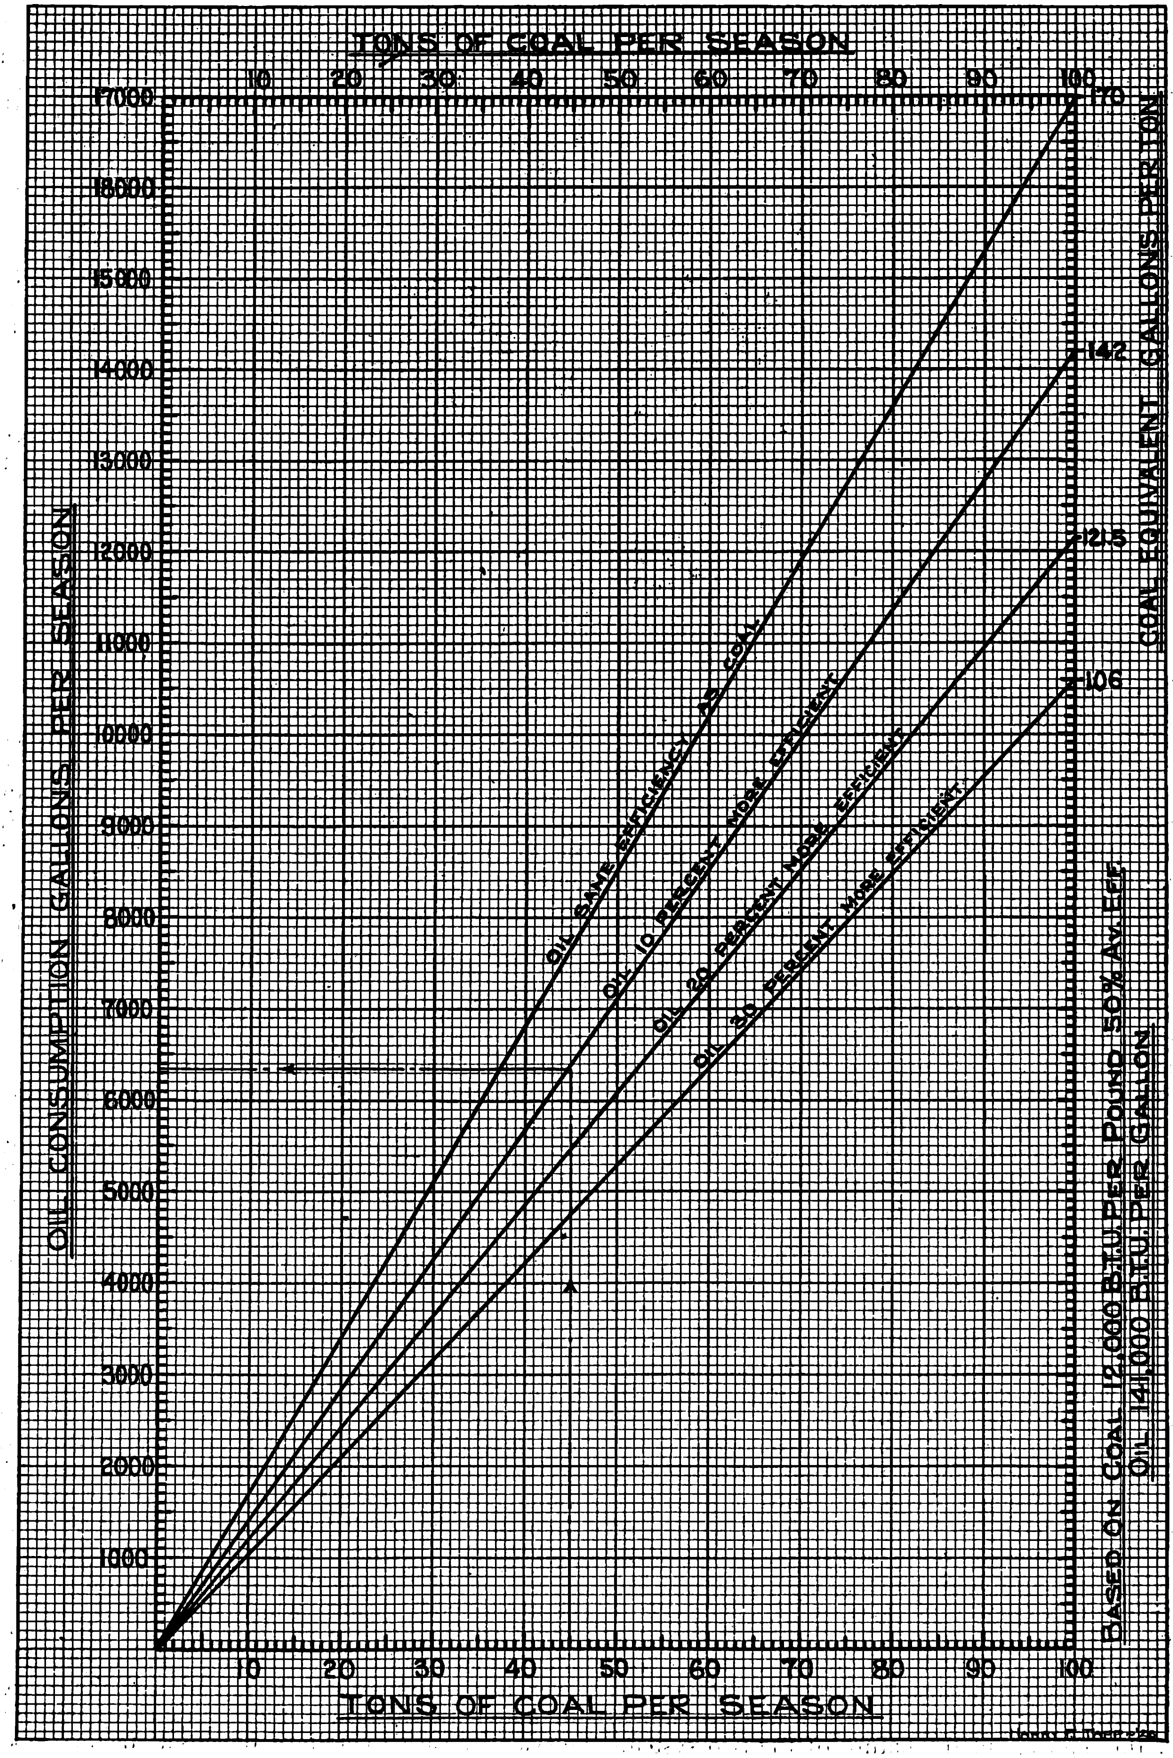

FIG. 30—OIL VERSUS COAL CONSUMPTION, B.T.U. BASIS.

tion. The question of providing adequate service is considered to be of vital importance and is being given much thought by oil burner manufacturers.

In many of the advertisements for oil burners the cleanliness of this form of heat is pointed out as one of its biggest advantages. If the burner is correctly installed, all joints in the pipe tight and the proper inspection service maintained to prevent improper operation, this is, without doubt, a feature. If, however, after the burner is sold, proper care is not taken in adjustments and follow-up, the cleanliness afforded by an oil burner is somewhat questionable. If leaks occur in the pipe line or if for any other reason oil is allowed to collect on the floor a very unpleasant odor results, and if by chance this oil happens to become ignited the house becomes coated with an oily soot that is practically impossible to remove. Great care should also be exercised in filling the tank. In installations provided with improper sized tanks, several instances have been reported where the tank was overfilled, thus creating a severe strain on the tank as well as various joints in the piping and in many cases creating leaks which allowed the oil to spread throughout the basement. In instances where this has happened it has taken months to entirely eliminate the odor. All of the objections raised in this paragraph may be completely eliminated by the correct type of service, both in caring for the heater and installation and in filling the tanks. A method of eliminating the probability of overfilling the tank is to install a tank sufficiently large to overcome the necessity of part of a load being delivered.

Fig. 30 represents the number of gallons of oil which are equivalent to a given number of tons of coal. These curves are based on the British Thermal Unit content of the two fuels, 12,000 B.t.u. per pound being assumed for coal and 141,000 B.t.u. per gallon for oil. The efficiency of the coal installation is assumed as 50 per cent, while oil installations of 50, 60 and 70 and 80 per cent are considered. This curve was prepared by Harry F. Tapp of the American Oil Burner Association. Fig. 31 represents a comparison of the amount of oil and gas based on the B.t.u. content. The oil is assumed to have 141,000 B.t.u. per gallon, and the gas B.t.u. content is varied from 300 to 1100 B.t.u. per cubic foot. The efficiency for the oil and gas is 65 and 80 per cent respectively. This figure was also prepared by Harry F. Tapp.

SERVICE AND RECORD IN SERVICE

The total number of burners sold by one large power company and which, in accord with their sales policy, are serviced by them is between 650 and 700. The average number of calls per day during the heating season is 19, only four of which are for interruptions of heat. This relatively good service record is without doubt due to the monthly inspection service which is provided free.

An oil burner dealer located in Madison, Wis., stated at the 1928 convention of the American Oil Burner Association that he had approximately 200 burners installed, and his service calls averaged between 8 and 12 a day. Many of these calls merely required minor adjustments, while others were caused by empty oil tanks.

An oil dealer in Louisville stated that an average of one call per burner per month was considered normal. Some of his calls were for the new installations where the owner had not become accustomed to the operation of the burner. If the burner remained inoperative for an extended period of time, even though the temperature of the house were normal, a service man was called when the real reason for the non-operation of the burner was that no heat was required.

In all of the instances noted above, the service was free. In the discussion at the American Oil Burner Convention, the question of reducing needless service calls was raised. One of the methods proposed was to have a definite service period, and charge for all calls after that time had expired. The dealers were somewhat divided on the advisability of doing this, but they were absolutely united in upholding the absolute necessity for prompt and efficient service.

Under existing conditions, if the number of calls per burner per month in excess of the regular inspection calls exceeds one, some action should be taken to determine the cause. In analyzing the reasons for service calls it was found that less than half of them were for interruptions of heat. Of this group, calls due to lack of oil and incorrect thermostat settings formed an appreciable part. The calls not due to interruptions of heat included minor adjustment of the burner, elimination of noise, leaks in oil line, high fuel bills and changing of the thermostat setting. There are, of course, many calls in connection with a new installation which are automatically eliminated as the house owner becomes familiar with the system. These calls, even though needless, must be given prompt attention if the good will of the owner is to be maintained.

MERCHANDISING

The three types of merchandising covered in this survey are: First, the selling as agent for one make of burner; second, the selling as agent for more than one make of burner, and third, selling the "idea" of using oil heat. There are three different methods of selling as agent for one make of burner covered by this report. The first method is for the electricity supply company to make the actual sale, install the burner and furnish the necessary service. The second method is for the electricity supply company to make the actual sale and then refer the purchaser to the dealer or agent of the burner manufacturer for the installation and service. The third method is for the power company to sell the burner and to contract with a local plumber or heating man for the installation and service. The plumber or heating man who installs the burner reports directly to the power company, but the power company does not hold itself responsible for any service to the burner.

In various cases under the second method, permanent arrangements have been made with the manufacturer to take care of the installation and service of burners sold by the power company for an indefinite period. In some instances, however, the agreement between the power company and the oil burner manufacturer may be only temporary in nature, and after sufficient time has elapsed for the power company to train its own installation and service department, the entire work is taken over by it. In selling as agent for more than one make of burner, the three different methods outlined above also apply.

There are numerous ways of selling the idea of using oil heating, either by advertising, display or personal recommendation. The actual display of several standard makes of burners by the power companies is one of the most effective methods of selling the idea. In some instances the dealers may be allotted space and furnish their own representatives to explain the principles of operation and the advantages of their respective burners. In other cases the burners may be shown by a representative of the power company, and all leads obtained from this display reported back to all of the various dealers or agents of manufacturers of the burners on display, the sale, installation and servicing being done by the manufacturer or his representative.

One large power company has been actively engaged in selling one make of oil burner for the past two years and a half. A separate department is maintained for the sale of the burner. All salesmen work on a straight commission basis. The installation and service of the burners is now done by the company. In the beginning the installation of the tank was let out to a separate contractor, but this proved a most unsatisfactory arrangement, and it was discontinued. Tanks are now installed by the company, under the cement in customers' cellars and the cement replaced; they are built up and welded in the cellar. The trouble encountered in the installation of tanks has been practically eliminated. In view of the difficulties of this company in training its service and installation department, the man in charge of this department is of the opinion that no power company should undertake the installation and servicing of any burner until an efficient department has been organized for these purposes. Rather an agreement with the oil burner manufacturer for the installation and servicing of the burners until an adequate and efficient servicing department for oil burners, if desired, is built up.

Two other important companies have recently undertaken the sale of one make of oil burner, and they have made agreements with local plumbers and heating contractors for the installation and service of the burners. No instances were found where a *permanent* agreement had been made with the oil burner manufacturer for the installing and servicing of the burners. Servicing arrangements are a local problem, and the desirable method is the one which produces best service at lowest cost.

Some companies prefer to sell the idea of oil heating rather than to sell the burners themselves. In selling the idea some care should be taken to differentiate between burners which have been investigated from a fire and casualty hazard and those which have not. It does not seem advisable to even consider burners which have not been listed as standard by the Underwriters' Laboratories.

Sales and Installation Record Forms

One company actively interested in the sale of oil burners has developed five forms, which they have found to be of great value. Form No. 1 (Fig. 94) is the Salesman's Report; it provides spaces for pertinent data concerning the prospect. Form No. 2 (Figs. 95-98) is known as the "Estimate Survey"; it provides spaces for all data influencing the making of an estimate. Form No. 3 (Figs. 99-103) is the "Installation Survey"; it provides spaces for details which affect the installation of the burner and is made up after the estimate has been accepted. Form No. 4 (Fig. 104) is used to compile all expenses actually expended in the installation of the burner; it serves as a basis for new estimates when similar conditions exist. Form No. 5 (Fig. 105) "Installation Data Sheet" provides spaces for pertinent items and acts as a history of the installation. All of the previously mentioned forms may be found in Appendix C of this report.

RADIO INTERFERENCE

It is pertinent to add a suggestion in connection with radio interference. All oil burners using electrical ignition may be the source of some radio interference unless the proper precautions are taken. The disturbance, which may be caused by types using intermittent ignition, is limited to between 5 and 30 seconds at the time of ignition. The disturbance caused by the continuous operating type may be continuous and highly objectionable unless some provision is made for its elimination.

Motors are not in themselves necessarily a source of radio interference, but may, particularly if allowed to become dirty, become serious offenders. A trap or filter like the one described in the N. E. L. A. Publication No. 267-98, "Radio Coordination," may be used to overcome the interference caused by either the ignition or motor. To insure against the possibility of disturbing interference, two separate filters may be installed, one for the ignition and one for the motor. Some burner manufacturers include filters as part of the burner equipment.

MANUFACTURERS' SECTION

Part of the investigation of oil burners consisted in sending a questionnaire, covering details which were deemed to be of importance, to representative manufacturers throughout the United States. The questionnaire which was sent out is shown below:

QUESTIONNAIRE

1. Total number of burners in operation.
2. Number of burners installed in 1927.
3. Types of burners.
   (a) Picture of mechanical unit, picture of unit installed.
4. Type of ignition.
5. Grade of oil recommended.
6. Operating principles.
   (a) Is oil atomized or vaporized?
   (b) Method of atomization or vaporization.
   (c) Is the oil fed to burner under pressure?
   (d) Is compressed air used (if so, what is the pressure)?
   (e) Is it necessary to preheat oil in cold weather when stored in outside tanks?
   (f) What are the temperature limits for the oil in efficient operation?
   (g) If preheating is necessary, how is it accomplished?
7. Motor.
   (a) Make, size and type.
   (b) Characteristics—
      1. Speed.
      2. Efficiency.
      3. System of oiling.
8. Brief description of automatic and semi-automatic control.
9. Can burner be installed in any good boiler or furnace?
10. Does the shape or type of boiler or furnace affect the efficiency? If so, on which type or types is your burner most efficient?
11. What are the rating limits of your burners in radiation feet?
12. Are electrical filters or traps, to prevent radio interference, part of the original equipment?
13. List prices.

Seventy-five per cent of the companies to whom the questionnaire was sent replied in detail. The replies are tabulated in Table VII of this report. Representative illustrations of various burners and installations (Fig. 32-87, inclusive) appear on preceding pages in alphabetical order according to manufacturer.

The question which concerned the efficiency of the motor is not included in the tabulation of results, as there was a general misunderstanding of the intent of this question; some companies supplied the power factor, others the apparent efficiency, and the minority the actual efficiency. In some cases the power factor and apparent efficiency might be easily confused with the actual efficiency. For this reason, and since the motors used in the various burners were practically all of standard makes, the characteristics being available from the various motor manufacturers, it was deemed advisable to omit the answers to this question. It might also be recalled that the oil burner manufacturers were among those who subscribed to the conclusions of the joint committee on fractional horse-power motors. The characteristics may, therefore, be expected to conform with those accepted by the Committee. The report of this Committee, as given in the *Electrical World* 91-7, page 350, is contained in Appendix D of this report.

The list prices of the burners have been omitted as these data were not supplied by all of the companies, and it was not considered advisable to publish a partial list of this character. The replies, however, have been carefully tabulated, and if it is possible to complete the list before the publication of the next report, they will be included therein.

In the question, "Does the shape of the boiler or furnace affect the efficiency?", there was also an apparent misunderstanding inasmuch as some of the companies regarded the question as pertaining to combustion efficiency and not overall efficiency, which was originally intended. This possibly accounts for the statement that the shape of the particular installation does not have any effect on the efficiency.

TABLE VII

REPLIES TO QUESTIONNAIRES ON MANUFACTURERS DATA

Questions	American Nokol Co.	Automatic Burner Corp.	Baker Steam Motor Car & Mfg. Co.	Arthur H. Ballard of Mass. (Ballard Jr.)	Bettendorf Oil Burner Co.	Caloroil Burner Corp.	Chalmers Oil Burner Co.	Cleveland Steel Products Co.
1. Total number of burners in operation.	45,000	10,000	8,000	1,800	200	2,607	500	2,000
2. Number of burners installed in 1927.	6,000	1,700	1,500	900	200	616	100	518
3. Types of burners	Standard Nokol. Nokol-Rotary type. Aetna.	Centrifugal — Atomization.	Fire Pot Type 32-36 Gravity; Gun Type 28-30 Gravity.	Mechanical Atomizing.	Low pressure.	Mechanical — Low pressure vacuum oil lift.	Power type.	Rotary type.
4. Type of ignition	Gas and electric.	Gas or electric	Electric.	Both gas and electric.	Electric or combination gas-elec.	Gas, electric and electric-gas.	Gas and electric.	Gas.
5. Grade of oil recommended	St'd Nokol — 36° Baumé. Nokol Rotary. 32° Baumé. Aetna 28-30° Baumé.	28-32° Baumé.	Fire pot Type 32-36° Baumé; Gun Type 28-30° Baumé.	28-32° Baumé.	28-32° Baumé.	28° Baumé.	Gas oil.	32-34° Baumé
6. Operating Principles: (a) Is oil atomized or vaporized?	Atomized.	Atomized.	Atomized.	Atomized.	Atomized.	Atomized.	Atomized	Atomized
(b) Method of atomization or vaporization.	St'd and Nokol—Nozzle— Venturi principle. Aetna and Nokol Rotary: Centrifugal force through use of revolving spray pump.	High Speed Centrifugal.	Spray Nozzle.	Special emulsion pump.	Low pressure wet blower pump.	Oil is lifted by vacuum from level 2⅛" below the tip of oil nozzle.	H. pressure	Rotating distributor head.
(c) Is oil fed to burner under pressure?	No.	No.	Yes.	Yes.	No.	No.	Yes.	No.
(d) Is compressed air used. Pressure?	No.	No.	No.	1.5 lbs.	2-6 lbs.	3.5-5 lbs.	Pump.	No.
(e) Is it necessary to preheat oil in cold weather when in outside tanks?	No.	No.	No.	No.	No.	No.	No.	No.
(f) Temperature limits of oil eff. operation.			0°.	0°	50-70° F.		Best at 70° F.	
(g) If preheating is necessary, how accomplished?	None.	None.	None.	None.	None.	None.	None.	None.
7. Motor: (a) Make, size, type.	Aetna Burner: Holtzer-Cabot ⅙ to ½ h.p. Repulsion Induction and Westinghouse 2 h.p. Rep. Ind. Nokol Rotary: Ohio 1/12 h.p. split phase. Standard Nokol: Westinghouse 1/10 to ¼ h.p. split phase.	1/12 h.p. Universal.	Westinghouse ¼ h.p. No. 45 R.B.-A.R.60~110-220 v. ¼ h.p. No. 45 R.A.-A.R.30~110-220 v. ¼ h.p. No. 45 5B.-C.D.H.-D.C. ½ h.p. No. 45 R.A.-A.R.60~110-220 v.	Westinghouse A.R.S.-¼ h.p.	Emerson ¼, ⅓ and ¾ h.p. repulsion induction.	Century. ¼ to 3 h.p. Split phase in ¼ h.p. size repulsion induction in all other sizes.	Janette R.I. ⅙, ¼, and ⅓ h.p.	Emerson, single phase 110 volts 60 cycles.
(b) Speed.	Aetna and Nokol Rotary 1750 r.p.m. Standard Nokol 3500 r.p.m.	12,000 r.p.m.	1750, 1450, 1750, 3450 r.p.m. respectively.	1725 r.p.m.	1150 to 1750 r.p.m.	1750 r.p.m.	1800 and 3600 r.p.m.	1750 r.p.m.
(c) System of oiling.	Wool packed bronze sleeve bearings.	Wick with Large Reservoir. (once yearly.)	Oil cups.	Underfed wicking.	Wool packed bearing.	Wool packed bearings.	Wool packed.	Sleeve wool packed.

REPLIES TO QUESTIONNAIRES ON MANUFACTURERS DATA

Questions	American Nokol Co.	Automatic Burner Corp.	Baker Steam Motor Car & Mfg. Co.	Arthur H. Ballard of Mass. (Ballard Jr.)	Bettendorf Oil Burner Co.	Caloroil Burner Corp.	Chalmers Oil Burner Co.	Cleveland Steel Products Co.
8. Automatic and semi-automatic control	Aetna: Standard Minneapolis No. 10 Protecto System in conjunction with low voltage thermostat. Nokol Rotary: Minneapolis Jr. Series 10. Protecto System is used with a low voltage series 10 thermostat. Standard Nokol Honeywell System comprised of a low voltage thermostat in conjunction with their type "D" regulator.	Trip bucket, 3 ball check valve, thermostat, boiler control, Minneapolis protectorelatand pyrostat or equivalent.	Minneapolis Series 10 controls.	Full automatic control using the Mercoid Corp's Visa flame control with either Pressurestat or Aguastat boiler controls. If hot air furnace, hot air control and governed by room thermostat.	Minneapolis Series 10 controls.	Minneapolis and Honeywell.	Minneapolis and Honeywell.	Minneapolis Heat Controls No. 10.
9. Can burner be installed in any good boiler or furnace?	Yes.	Yes: fire box dimensions greater than 18".	Yes.	Yes.	Yes.	Yes.	Yes.	Yes.
10. Does the shape of the boiler or furnace affect the efficiency? Type best suited for particular burner?	Efficiency of Burner not affected. General operation more efficient in special boilers for oil or gas, followed by steel boilers, horizontal cast iron, water tube and sectional and last the round type vertical boiler.	Of course: One with combination of greatest prim heating surface — longest flue travel.	No, except the longer the gas travel the better the efficiency.	No.	Yes. Boiler with long gas travel.	No. Not as a general rule.	Surely. Burner efficiency the same boiler efficiency varies due to leakage of air, insufficient section, excessive radiation.	No.
11. What are the rating limits of your burners in radiation feet?	Aetna: 12 sizes. 300 h.p. to 500 sq. ft. steam, 800 sq. ft. hot water. Nokol: 10 different sizes. Max. 4690 sq. ft. steam, 7500 sq. ft. hot water; min. domestic hot water heaters. Rotary minimum 1250 sq. ft. steam.	3000 ft. steam actual load.	No. 10. 960 ft. steam, No. 20 1800 ft., No. 30-4500 ft., No. 50-1800 ft., No. 60-6000 ft. steam.	No. 5. Junior 100-1000 ft. No. 7—500-2500 ft. No. 9—2000-5000 ft. No 11 — 4000-10,000 ft.	300-4000 ft. steam	Standard units to 10,000 ft. steam. special units for any size.	350-3000 ft.	
12. Are electrical traps of filters to prevent radio interference part of original equipment?	No.	No.	No.	Yes.	No.	No. Only on request.	Only used when trouble occurs.	No.

TABLE VII—(*Continued*)

REPLIES TO QUESTIONNAIRES ON MANUFACTURERS DATA

Questions	Combustion Fuel Oil Burner Co.	Commonwealth Engineering Co.	Electrol Inc.	The Fluid Heat Corp.	Gulf Oil Burner Co.	Hardinge Bros. Inc.	Lammert & Mann Co.
1. Total number of burners in operation.	9494	498	17,000-18,000.	319	2500		3000
2. Number of burners installed in 1927.	1723	300	Approx. 3500-4000.	228	1700	2000-3000	1000
3 Types of burners.	Air jet atomizing.		3 types. All mechanical draft.		5 types.	Gravity or pressure feed.	
4. Type of ignition.	Gas or electric.	Gas.	Electric.	Gas or electric.	Gas and electric.	Manual, gas, gas-electric.	Gas and electric.
5. Grade of oil recommended.	24° Baumé or higher. Atomized.	32-36° Baumé Gas oil.	As low as 28° Baumé and Pacific Diesel of 25° Baumé.	28° Baumé.	28° Baumé and up.	Gravity 32° Baumé. Automatic. 28-32° Baumé. With preheaters 18-24° and 18-22° Baumé.	28° Baumé.
6. Operating Principles: (a) Is oil atomized or vaporized?	Air jets.	Atomized.	Atomized.	Atomized.	Atomized.	Atomized.	Atomized.
(b) Method of atomization or vaporization.		Rotary cup.	Mechanical. Oil delivered under pressure to atomizing nozzle.	Pressure.	Positive pressure pump.	Mechanical cup.	Nozzle.
(c) Is oil fed to burner under pressure?	Yes.	Gravity pressure from pump.	Yes.	No.	Yes.	Low pressure pump or gravity.	Yes. 7 lbs.
(d) Is compressed air used. Pressure?	2-6 lbs.	No.	No.	No.	1 1/8 lbs.	Low pressure.	5 lbs.
(e) Is it necessary to preheat oil in cold weather when in outside tanks?	Not for recommended oil. Heavier oils heated for flowage.	No.	Sometimes.	No.	No.	With heavy oil. At or near combustion chamber.	No.
(f) Temperature limits of oil in eff. operation.	Independent of temp. above flowage point.	0°.	40° F.			140-180° F.	60-175° F.
(g) If preheating is necessary, how accomplished?	Water coils — electric heaters	None.	Electric preheater between pump on the burner and atomizing nozzle.	None.	None.	Indirect heater.	Steam.
7. Motor: (a) Make, size, type.	Standard makes ¼ to 3 h.p. Repulsion induction and polyphase.	G. E. pump motor ⅙ h.p. split phase, Burner motor 1/20 h.p. polyphase. Note: Pump motor is a combination frequency changer set furnishing 180 cycle current to the polyphase burner motor.	G. E., Century, Ohio, and Emerson split phase ⅙ h.p.	G. E. ¼ h.p. type R.S.A.	G. E. ¼ h.p. R.I.	Century Motors on A.C. Star Motors D.C. ¼, ⅓ and ½ h.p. single phase incorporate repulsion start principle. Polyphase all 3 phase squirrel-cage induction. D.C. motors all compound wound.	Baldor and G. E. Depends on installation.
(b) Speed.	1150 r.p.m.	Frequency changer 3600. Polyphase 10,300 r.p.m.	1750 and 1150 r.p.m. respectively.	1725 r.p.m	1750 r.p.m.	1750 r.p.m.	1200-1750 r.p.m.
c) System of oiling.		Frequency changer, oil one end, splash system other end. Polyphase centrifugal through hollow shaft.	Wool pack.	Wool packed bearings.		Wool yarn wicking. Grease cups.	

TABLE VII—(*Continued*)

REPLIES TO QUESTIONNAIRES ON MANUFACTURERS DATA

Questions	Combustion Fuel Oil Burner Co.	Commonwealth Engineering Co.	Electrol Inc.	The Fluid Heat Corp.	Gulf Oil Burner Co.	Hardinge Bros. Inc.	Lammert & Mann Co.
8. Automatic and semi-automatic control.	Automatic control is accomplished by means of thermostats and safety features protecting against overheated boilers, failure to ignite or any other sub-normal condition.	Thermostat, boiler control.	Electrol burners are entirely automatically controlled, being turned on by a room thermostat and being turned off either by a room thermostat or a controlling device responsive to conditions in the boiler or furnace. Electrol burners are equipped with a safety mechanism which is responsive to temperature conditions in the combustion chamber.	Minneapolis series 10 controls.	Combustion control "Stackstat" own make.	For automatic operation with gas ignition gas valves of own manufacture. Electrical equipment usually high voltage type consists of pressurestat, aquastat, thermostat and a hyrostat for regulating hot water supply in summer. With gas electric ignition, an electrically operated gas valve, a relay for ignition timing and a combustion safety control in addition to regular electrical equipment. Semi-Automatic. Boiler control either manual or automatic.	Mercoid
9. Can burner be installed in any good boiler or furnace?	Burner is universal sizes available in any boiler or furnace.	Yes.	Yes.	Yes.	Yes.	Yes.	Yes.
10. Does the shape of the boiler or furnace affect the efficiency? Type best suited for particular burner?	No, excepting so far as the particular furnace happen to be an inefficient heat transformer.	Burner seems most efficient in hot air plant.	Owing to difference in design and structure of furnaces, the results would be better in some instances than others.	No.	Not much.	The shape or type of boiler naturally effects the efficiency of operation or combustion. A boiler with ample combustion space will make a better steamer than one with restricted chamber volume.	No.
11. What are the rating limits of your burners in radiation feet?	300 sq. ft.—up to any size whatever.	1500 ft. steam, 2000 hot water.	TJ.—600-800 sq. ft. steam. Model T. up to 3000 sq. ft. steam. Model TD up to 8000.	2500 ft. steam.	200-6000 sq. ft. actual radiation.	300-25,000 sq. ft. steam.	800-30,000 sq. ft.
12. Are electrical traps or filters to prevent radio interference part of origina equipment?	No.	No.	Upon request — without charge.	No.	No.	No, but are willing to.	No.

TABLE VII—(*Continued*)

REPLIES TO QUESTIONNAIRES ON MANUFACTURERS DATA

Questions	Marr Oil Heat Machine Corp.	McIlvaine Burner Corp.	May Oil Burner Corp.	Nu-Way Corp.	Preferred Oil Burner Inc.	Ray Mfg. Co.	Rickard Engineering Corp.
1 Total number of burners in operation.	5000	About 600.	10,000.	5,000.	Approx. 11,000.	45,000.	About 200.
2. Number of burners installed in 1927.	600	About 200.	3,912.	1,500.	Approx. 2000.	No figures.	About 150.
3. Types of burners.	Models E, G and H.	Continuous flame, mechanical draft.	Type "L," Type "C." Type "A."		Model D-1, D-2, D-3 and Junior.	Horizontal rotary.	Mechanical atomization.
4. Type of ignition.	"E" and "G" gas pilot; "H" gas and oil pilot.	Manual.	Electric.	Comb. gas and electric or electric.	Electric or comb. gas-electric.	Gas, electric, gas-electric.	Electric.
5. Grade of oil recommended.	Models E and G 24° Baumé and up. Model H 32° Baumé and up.	36° Baumé.	28-45° Baumé. Diesel oil 25° Baumé.	28-30° Baumé.	28-32° Baumé.	25° Baumé or lighter.	Oil No. 4 usually 28° Baumé.
6. Operating Principles: (a) Is oil atomized or vaporized?	"E" and "G" atomized — "H" vaporized.	Vaporized.	Atomized.	Atomized.	Atomized.	Atomized.	Atomized.
(b) Method of atomization or vaporization.	"E" and "G" rotary atomizer. "H" oil and gas mixed before combustion.	Contact with hot combustion chamber.	Specially designed atomizer.	Pressure.	Oil is whirled against air from a sirocco fan.	Rotary cup.	Mechanical.
(c) Is oil fed to burner under pressure?	No.	Gravity.	Yes.	No.	Vacuum feed..	Yes.	Yes.
d) Is compressed air used. Pressure?	None.	2 inches for mechanical draft.	No.	No.	2-6 lbs.	No.	No.
e) Is it necessary to preheat oil in cold weather when in outside tanks?	No.	No.	No.	No.	No.	No.	No.
(f) Temperature limits of oil in eff. operation.					30° or over.	Between 60-120°.	Depends on oil.
(g) If preheating is necessary, how accomplished?		None.	None.	None.	None.	None.	None.

Question	Marr Oil Heat Machine Corp.	McIlvaine Burner Corp.	May Oil Burner Corp.	Nu-Way Corp.	Preferred Oil Burner Inc.	Ray Mfg. Co.	Rickard Engineering Corp.
7. Motor: (a) Make, size type.	"E" and "G": —Century ¼ h.p. "H" G. E. 1/20.	Janette 1/20 h.p. split phase.	Type "A":—G. E. split phase—⅙ h.p. Type "L":—Century ¼ h.p. Repulsion Induction. Type "C": —Century ½ h.p. Repulsion Induction.	Emerson 1/20-⅙-h.p. split phase ⅙-⅓-¾ h.p. Repulsion Induction.	Emerson or Wagner Repulsion Induction. Model D-1, ⅙ h.p.; Model D-2, ¼ h.p. Model D-3, ½ h.p.	Westinghouse Induction ⅛-10 h.p.	Janette ⅙ h.p. Repulsion Induction 60 cycle A.C. only.
(b) Speed.	1725 r.p.m.	750 r.p.m.	1750 r.p.m.	1800 and 1200 r.p.m.	1725 and 1440 r.p.m.	3450 r.p.m.	1750 r.p.m.
(c) System of oiling.	Wick with reservoir.	Oil reservoir packed with lamb's wool.	Wool yarn.	Wool packing.	Oil reservoir and yarn wicks.	Automatic oil ring on pressure burner, worm on pump burners.	Oil packed bearing.
8. Automatic and semi-automatic control.	Model E-g Honeywell low voltage program. Model "H" —"Contactor" high voltage.	5 point thermostat, 5 point regulator and 3 wire safety switch. This model gives five operating stages from low to high in accordance with the demand for heat.	Honeywell or Minneapolis.	Minneapolis Protecto Relay or Mercoid S.D.P. Controls.	Preferred Hart System, timing switch, flue safety switch, heat control and recycling switch.	Automatic Honeywell or contactor controls fixed fire or high and low fire. Semi-automatic control of oil, air and draft.	Standard Honeywell system.
9. Can burner be installed in any good boiler or furnace.	Yes.	Yes.	Yes.	Yes.	Yes.	Yes.	Yes.
10. Does the shape of the boiler or furnace affect the efficiency? Type best suited for particular burner?	Not much. Round or square boilers are the most efficient with slight drop in the rectangular type.	Laboratory tests show practically no effect on efficiency by shape or type of boiler.	Square section as opposed to round boilers are found to be more efficient for oil heat. Many special types of steel water tube and fire tube boilers recently developed for oil heat are very good.	No.	Our burner develops the same efficiency in all boilers or furnaces. However different kinds of boilers or furnaces give different efficiencies and of course an oil burner's performance is governed to a large extent by these limitations.	No.	The burner is the same but design of boiler can affect overall efficiency tremendously. Most good coal burning boilers are also good oil burning boilers.
11. What are the rating limits of your burners in radiation feet?	Model E 16,000 ft. steam. Model H 1000 ft. water.	6 sizes 400-2400 sq. ft. of steam. Twin units up to 4,800 sq. ft.	Type A. 600 sq. ft. steam, 1000 sq. ft. hot water. Type L. 2400 sq. ft. steam, 4000 sq. ft. hot water. Type C. 8400 sq. ft. steam, 14,000 sq. ft. hot water.	50-6000 ft.	Junior 350 sq. ft. steam. D-1 600 sq. ft. steam. D-2 2000 sq. ft. steam. D-3 3000 sq. ft. steam.	600-150,000 ft.	500-15,000 ft. steam.
12. Are electrical traps or filters to prevent radio interference part of original equipment?	Yes.	No.	With type A.	No.	No.	Yes, but optional.	No.

TABLE VII—(*Continued*)

REPLIES TO QUESTIONNAIRES ON MANUFACTURERS DATA

Questions	Silent Automatic Corp.	Super Oil Heator Co.	Sword & Kimber Co.	Timken-Detroit Co.	Wayne Co.	Williams Oil-O-Matic Heating Corp.	Winslow Boiler & Engineering Co.
1. Total number of burners in operation.	About 13,000.	Between 5 and 6000.	2200.	Approx. 9000.	3000.	Between 60 and 70,000.	
2. Number of burners installed in 1927.	About 5,000.	2000.	650.	Approx. 2750.	1000.	Approx. 15,000.	
3. Types of burners.	Centrifugal atomization plus "gasification."	Rotary.	Pot type. Model "L" and Model "J."	Arrow and Model 20.	B-3, B-4, B-6.	Two types.	Kleen Heet Series 800. Kleen Heet type G.J.
4. Type of ignition.	Gas and electric.	Gas and electric.	Gas and electric.	Electric.	Gas, electric, gas-electric.	Electric or gas.	Electric.
5. Grade of oil recommended.	36-40° Baumé distillate.	28-32° Baumé.	36-40 °Baumé.	Arrow 35° Model 20 28° Baumé.	Not heavier than 28° Baumé.	28-30° Baumé.	28-32° Baumé.
6. Operating Principles: (a) Is oil atomized or vaporized?	Atomized and vaporized.	Atomized.	Model "L" atomized. Model "J" vaporized.	Atomized.	Atomized.	Atomized	Atomized
b) Method of atomization or vaporization.	Atomization by centrifugal force. Vaporization by mixture with hot gases.	Compressed air.	Model "L" gun and target. Model "J" heat of return gases.	Arrow, Compressed air. Model 20 low pressure air.	Pump pressure and nozzle.	Special atomization vane pump.	Winslow stem-tip nozzle assembly.
(c) Is oil fed to burner under pressure?	No.	No.	Model "L," pump. Model "J," gravity.	No.	Suction pump.	Yes, special metering pump.	Yes.
(d) Is compressed air used? Pressure.	No.	4 lbs.	No.	Arrow, 5-18 lb. Model 20—No.	No.	Mixture of air and oil 2 lbs	No.
(e) Is it necessary to preheat oil in cold weather when in outside tanks?	No.	No.	No.	No.	No.	No.	No.
(f) Temperature limits of oil in eff. operation.		Outside temp. of 0°.	0° F.	0° F.	Not less than 25° F.		
(g) If preheating is necessary, how accomplished?	None.	None.	None.	None.	None.	None.	None.
7. Motor: (a) Make, size, type.	Ohio — split phase induction 1/12 h.p.	Leland ⅙ and ¼ h.p. vertical repulsion induction.	G. E. ⅙ h.p.	Arrow: Robbins & Meyers ¼ h.p. repulsion induction. Model 20: Robbins & Meyers ⅙ h.p. split phase.	G. E. ⅙-¼ and ½ h.p. repulsion induction.	Baldor, ¼ h.p. repulsion induction.	Series 800: Century ⅙ h.p. repulsion induction. Type G.J. Westinghouse ⅙ h.p. repulsion induction.
(b) Speed.	1750 r.p.m.	1140 and 1725 r.p.m.	1750 r.p.m.	3500 and 1750 r.p.m. respectively.	1725 r.p.m.	1200 and 1800 r.p.m.	1750 r.p.m.
(c) System of oiling	Wool packed bearings.	Large ball bearings wool yarn. Perpetual lubrication lower bearing.	Packed bearings.	Wick and wool pack.	Oil cups.	Front bearings bath of fuel oil. Rear motor bearings oil cup.	Standard Century motor.

TABLE VII—(*Concluded*)

REPLIES TO QUESTIONNAIRES ON MANUFACTURERS DATA

Questions	Silent Automatic Corp.	Super Oil Heator Co.	Sword & Kimber Co.	Timken-Detroit Co.	Wayne Co.	Williams Oil-O-Matic Heating Corp.	Winslow Boiler & Engrg. Co.
8. Automatic and semi-automatic control.	Complete automatic controls consisting essentially of a motor program switch, a thermostat, a pressure or temperature limiting device on the heater and a combustion safety device.	110 v. controls in series.	Complete automatic control either Minneapolis or Federal gauge.	Minneapolis.	Honeywell control system.	Full automatic, thermostat and boiler; high voltage thermostat, direct control also manual.	Automatic controls, Minneapolis type using room thermostat and boiler controls operating through Minneapolis protecto relay with protectostat controlling burner operation from the action of the flame upon the protectostat diaphragm.
9. Can burner be installed in any good boiler or furnace?	Yes.	Yes—of proper size.	Yes.	Yes.	Yes.	Yes.	Yes.
10. Does the shape of the boiler or furnace affect the efficiency? Type best suited for particular burner?	The shape of boiler or furnace does not affect the efficiency of combustion.	Some. Round type.	Inefficient boilers will not give efficient results with any oil burner. The Sword burner is adaptable to any shape or type of boiler with heating requirement within its range.	No.	Not a great degree.	Any good heating plant can be used effectively.	Series 800. No. Oil burning is most efficient, of course, in those boilers in which the indirect or flue heating surfaces permit the gases to completely yield their heat before entering the chimney. Type GJ. Round and square house boilers.
11. What are the rating limits of your burners in radiation feet?	250-5000 sq. ft.	650 steam. 1100 hot water	Model "L," 2000 ft. hot water. Model "J," 1000 ft. hot water.	Arrow, 2000 steam. Model 20: 1000 steam.	B-3 1250, B-4 3500, B-6 3000—all direct steam.	1200 r.p.m. burner-limit 1500 sq. ft. direct steam, 2500 sq. ft. hot water. 1800 r.p.m. burner limit 4000 sq. ft. direct steam, 6300 direct water	Series 800. 600-6800 sq. ft. steam, 1200 sq. ft. steam load.
12. Are electrical traps or filters to prevent radio interference part of original equipment?	No.	No.	No.	No.	No.	No.	No.

APPENDIX A

OIL FUEL SPECIFICATIONS*

Variation of Fuel Oils

Unfortunately gravity alone is not a true indication of the burning quality of an oil. Whereas one oil of a given gravity may flow readily and light with comparative ease, another of the same gravity may have a higher or lower flash point, be more viscous and in general have properties quite different from the first. The difficulties encountered by the oil burner manufacturer and the purchaser of the fuel oil are many. For example, the story is told of the manufacturer who designed his burner to satisfactorily ignite and operate on a 28 deg. Baumé fuel oil, advertised the burner extensively and guaranteed its operation on this basis. The burner was doing all that he claimed for it on the 28 deg. oil that he was getting in that territory, but when the burners were shipped to another territory it was impossible to get them to operate on the 28 deg. oil that was available in that locality, due to the fact that it had a higher viscosity and flash point, and differed radically in the properties of the oil for which the burner had been designed. This variation is due in part to the fact that the characteristics vary with the different crudes from which they are produced, and also to the fact that the oil companies mix or "blend" different grades in order to make one having the desired gravity. Consequently where gravity alone is the only specification mentioned in the purchase of the oil, it is practically impossible to expect any kind of uniformity in quality and characteristics.

Nomenclature. Designations of oil fuel properties and grades are confusing to the initiate in the business for the reason that they cannot be pinned down definitely and tangibly. In the sense that it is used to head this chapter "fuel oil" is meant to include all oils that are used for fuel burning purposes, regardless of their origin or use. When so used it includes kerosene, distillate, residuum and even crude oil. In market quotations and in the parlance of the filling station and oil burner man, "fuel oil" is the residual product remaining after the so-called kerosenes, distillates and gas oils have been distilled off in the refining process—providing, of course, that the residual product is not intended for lubrication stock or some purpose other than burning. It will be noted that the oils above 38-40 gravity, grouped as "burning oils," are principally kerosenes. Under the "fuel oil" group the gravity range, for distillates, is from 36 deg. to 40 deg. principally, with lower ranges in California. The most common range for gas oil is 32 deg. to 36 deg., and the majority of the oil for burning that is below 32 deg. is known as fuel oil. It is customary, at the present time, in buying oils to specify them on a gravity basis, but it is a well-known fact that gravity is not a reliable index to the quality of the oil and its combustion characteristics.

Classification. Because of the fact that gravity does not provide definite classification of fuel oils, the American Oil Burner Association has in the past three years made a study of the various characteristics of oil, and with the data that were collected in making this study has adopted a set of specifications covering the various grades of fuel oil that are in use today. The following table gives the specification number and name, together with the old designation and approximate gravity range.

---

*Reprinted by permission from "Handbook of Domestic Oil Burning," American Oil Burner Association, publishers.

A O B A DESIGNATION		OLD DESIGNATION	
Specification Number	Name	Gravity Range	Name
		48-44	Light Kerosene
		44-40	Kerosene
1	Furnace Oil—Light	40-36	Distillate
2	Furnace Oil—Med.	36-32	Gas Oil
3	Furnace Oil—Hvy.	32-28	Light Fuel Oil
4	Fuel Oil—Light	24-28	Medium Fuel Oil
5	Fuel Oil—Medium	24-18	Heavy Fuel Oil
6	Fuel Oil—Heavy	18-12	Very Hvy. Fuel Oil

The specifications which have been adopted by the Association were compiled by the Association's Committee on Uniform Oil Specifications with the aid and cooperation of the American Petroleum Institute and Committee D2 of the American Society for Testing Materials.

UNIFORM OIL FUEL SPECIFICATIONS OF THE AMERICAN OIL BURNER ASSOCIATION

OIL NO. 1.

Name: Furnace Oil—Light

Scope

1—This specification covers a light distillate oil for use in burners where a high grade fuel is required.

Properties

2—This oil shall conform to the following requirements: It shall be a hydrocarbon oil free from water, acid, grit and fibrous or other foreign matter likely to clog or injure the burner or valves.

(a) Flash Point:
  Minimum—[1] Legal or (Pensky-Martens Closed Tester) .... 110° F. or legal
  Maximum—(Pensky-Martens Closed Tester) 165° F.
(b) Water and Sediment, maximum 0.05%
(c) Pour Point, maximum .... 0° F.
(d) Distillation Test:
  When 10 per cent has been collected in the receiver, the thermometer reading shall not exceed .... 420° F.
  The end point shall not be higher than...... 600° F.

Methods of Testing[2]

3—The properties enumerated in these specifications shall be determined in accordance with the following methods of test of the American Society for Testing Materials, except as specified in paragraph (a).

(a) Flash Point:
  [1] Minimum—the flash point, instrument and method for determining minimum flash point shall be that legal for the locality in which the oil is sold. In absence of legal requirements, the minimum flash point shall be determined in accordance with the Standard Method of Test for Flash Point by means of the Pensky-Martens Closed Tester (Serial Designation D 93).
  Maximum—Standard Method of Test for Flash Point by means of the Pensky-Martens Closed Tester (Serial Designation D 93).
(b) Water and Sediment:
  Standard Method of Test for Water and Sediment in Petroleum Products by Means of Centrifuge. (Serial Designation D 96).
(c) Pour Point:
  Tentative Method of Test for Pour Points of Petroleum Products (Serial Designation D 97-27 T).
(d) Distillation Test:
  Standard Method of Test for Distillation of Gasoline, Naphtha, Kerosene and similar Petroleum Products (Serial Designation D 86).

[2] In event changes are made in the Methods of Tests by the A S T M, the current Method of Test is to be used rather than those mentioned in the specifications.

OIL NO. 2.

Name: Furnace Oil—Medium

Scope

1—This specification covers a grade of distillate oil for use in burners where a high grade fuel is required.

Properties

2—This oil shall conform to the following requirements: It shall be a hydrocarbon oil free from water, acid, grit and fibrous or foreign matter likely to clog or injure the burner or valves.

(a) Flash Point:
  Minimum—[1] Legal or (Pensky-Martens Closed Tester) .... 125° F. or legal
  Maximum—(Pensky-Martens Closed Tester) 190° F.
(b) Water and Sediment, maximum 0.05%
(c) Pour Point, maximum .... 0° F.
(d) Distillation Test:
  When 10 per cent has been collected in the receiver, the thermometer reading shall not exceed .... 440° F.
  When 90 per cent has been collected in the receiver, the thermometer reading shall not exceed .... 620° F.

Methods of Testing[2]

3—The properties enumerated in these specifications shall be determined in accordance with the following methods of test of the American Society for Testing Materials, except as specified in paragraph (a).

(a) Flash Point:
  [1] Minimum—The flash point, instrument and method for determining minimum flash point shall be that legal for the locality in which the oil is sold. In absence of legal requirements, the minimum flash point shall be determined in accordance with the Standard Method of Test for Flash Point by means of the Pensky-Martens Closed Tester (Serial Designation D 93).
  Maximum—Standard Method of Test for Flash Point by means of the Pensky-Martens Closed Tester (Serial Designation D 93).
(b) Water and Sediment:
  Standard Method of Test for Water and Sediment in Petroleum Products by Means of Centrifuge (Serial Designation D 96).
(c) Pour Point:
  Tentative Method of Test for Pour Points of Petroleum Products (Serial Designation D-97-27 T).
(d) Distillation Test:
  Tentative Method of Testing Gas Oils (Serial Designation D 158-25 T).

[2] In event changes are made in the Methods of Tests by the A S T M, the current Method of Test is to be used rather than those mentioned in the specifications.

OIL NO. 3

Name: Furnace Oil—Heavy

Scope

1—This specification covers a grade of oil, generally known to the trade as light fuel oil intended for general industrial consumption, for use in burners where a medium low viscosity fuel is required.

Properties

2—This oil shall conform to the following requirements: It shall be a hydrocarbon oil free from water, acid, grit and fibrous or foreign matters likely to clog or injure the burner or valves.

(a) Flash Point:
  Minimum—[1] Legal or (Pensky-Martens Closed Tester) .... 150° F. or legal
  Maximum—(Pensky-Martens Closed Tester) 200° F.
(b) Water and Sediments, maximum........... 0.1%
(c) [2] Pour Point, maximum .... 0° F.
(d) Distillation Test:
  When 10 per cent has been collected in the receiver, the thermometer reading shall not exceed .... 460° F.
  When 90 per cent has been collected in the receiver, the thermometer reading shall not exceed .... 675° F.
(e) Viscosity, Saybolt Universal, at 100° F., maximum .... 55 sec.

Method of Testing [3]

3—The properties enumerated in these specifications shall be determined in accordance with the following methods of test of the American Society for Testing Materials, except as specified in paragraph (a).

(a) Flash Point:
  [1] Minimum—The flash point, instrument and method for determining minimum flash point shall be that legal for the locality in which the oil is sold. In absence of legal requirements, the minimum flash point shall be determined in accordance with the Standard Method of Test for Flash Point by means of the Pensky-Martens Closed Tester (Serial Designation D 93).
  Maximum—Standard Method of Test for Flash Point by means of the Pensky-Martens Closed Tester (Serial Designation D 93).
(b) Water and Sediment:
  Standard Method of Test for Water and Sediment in Petroleum Products by Means of Centrifuge (Serial Designation D 96).
(c) Pour Point:
  Tentative Method of Test for Pour Points of Petroleum Products (Serial Designation D 97-27 T).
  [2] The maximum pour point shall be 0° F., except for localities where the average temperature between Oct. 1 and May 1 is 40° F., or above, in which case the pour point may be plus 15° F. (see Fig. 18).
(d) Distillation Test:
  Tentative method of Testing Gas Oils (Serial Designation D 158-25 T).
(e) Viscosity:
  Standard Method of Test for Viscosity of Petroleum Products and Lubricants (Serial Designation D 88).

[3] In event changes are made in the Methods of Tests by the A S T M the current Method of Test is to be used rather than those mentioned in the specifications.

OIL NO. 4

Name: Fuel Oil—Light

Scope

1—This specification covers a grade of oil generally known to the trade as light fuel oil intended for general industrial consumption. It is for use in burners adapted to a medium viscosity fuel.

Properties

2—This oil shall conform to the following requirements: It shall be a hydrocarbon oil free from water, acid, grit and fibrous or other foreign matters likely to clog or injure the burner or valves.

(a) Flash Point:
  Minimum (Pensky-Martens Closed Tester).. 150° F.
  Maximum (Pensky-Martens Closed Tester). 250° F.
(b) Water and Sediment, maximum............. 1.0%
(c) Pour Point, maximum...................... 15° F.
(d) Viscosity, Saybolt Universal at 100° F., maximum .... 125 sec.

Method of Testing [1]

3—The properties enumerated in these specifications shall be determined in accordance with the following methods of test of the American Society for Testing Materials:

(a) Flash Point:
  Standard Method of Test for Flash Point, by means of the Pensky-Martens Closed Tester (Serial Designation D 93).
(b) Water and Sediment:
  Standard Method of Test for Water and Sediment in Petroleum Products by Means of Centrifuge (Serial Designation D 96).
(c) Pour Point:
  Tentative Method of Test for Cloud and Pour Points of Petroleum Products (Serial Designation D 97-27 T).
(d) Viscosity:
  Standard Method of Test for Viscosity of Petroleum Products and Lubricants (Serial Designation D 88).

[1] In event changes are made in the Methods of Tests in the A S T M, the current Method of Test is to be used rather than those mentioned in the specifications.

OIL NO. 5

Name: Fuel Oil—Medium

Scope

1—This specification is that of the Federal Specifications Board for Bunker Fuel Oil "B" and covers a grade of fuel oil suitable for burners adapted to oil of medium heavy viscosity.

Properties

2—The oil shall conform to the following specifications: It shall be a hydrocarbon oil free from grit, acid and fibrous or other foreign matters likely to clog or injure the burner or valves. If required, it shall be strained by being drawn through filters or wire gauze of 16 meshes to the inch. The clearance area through the strainers shall be at least twice the area of the suction pipe, and the strainers shall be in duplicate.

(a) Flash Point:
  Minimum (Pensky-Martens Closed Tester).. 150° F.
(b) Water and Sediment, maximum........... 1.0%
(c) Viscosity, Saybolt Furol at 122° F., maximum .... 100 sec.

Methods of Testing [1]

3—The properties enumerated in these specifications shall be determined in accordance with the following methods of test of the American Society for Testing Materials:

(a) Flash Point:
  Standard Methods of Test for Flash Point by means of the Pensky-Martens Closed Tester (Serial Designation D 93).
(b) Water and Sediment:
  Standard Method of Test for Water and Sediment in Petroleum Products by Means of Centrifuge (Serial Designation D 96).
(c) Viscosity:
  Standard Method of Test for Viscosity of Petroleum Products and Lubricants (Serial Designation D 88).

[1] In event changes are made in the Methods of Tests by the A S T M the current Method of Test is to be used rather than those mentioned in the specifications.

OIL NO. 6

Name: Fuel Oil—Heavy

Scope

1—This specification is that of the Federal Specifications

Board for Bunker Fuel Oil "C" and covers a grade of fuel oil suitable for burners adapted to oil of high viscosity.

Properties

The oil shall conform to the following specifications: It shall be a hydrocarbon oil free from grit, acid and fibrous or other foreign matters likely to clog or injure the burner or valves. If required it shall be strained by being drawn through filters or wire gauze of 16 meshes to the inch. The clearance area of the strainers shall be at least twice the area of the suction pipe and the strainers shall be in duplicate.

(a) Flash Point:
Minimum (Pensky-Martens Closed Tester) .. 150° F.
(b) Water and Sediment, maximum 2.0%
A deduction in quantity will be made for all water plus sediment in excess of 1.0 per cent.
(c) Viscosity, Saybolt Furol at 122° F., maximum 300 sec.

Methods of Testing[1]

3—The properties enumerated in these specifications shall be determined in accordance with the following methods of test of the American Society for Testing Materials:

(a) Flash Point:
Standard Method of Test for Flash Point by means of the Pensky-Martens Closed Tester (Serial Designation D 93).
(b) Water and Sediment:
Standard Method of Test for Water in Petroleum Products (Serial Designation D 95-27) (U. S. G. S. S. Method 300.11) U. S. Government Standard Specification Method 300.2 for sediment.
(c) Viscosity:
Standard Method of Test for Viscosity of Petroleum Products and Lubricants (Serial Designation D 88).

[1] In event changes are made in the Methods of Tests by the A S T M the current Method of Test is to be used rather than those mentioned in the specifications.

Methods of Testing Procedure

Complete information regarding the procedure for making tests specified can be obtained from the American Society for Testing Materials, 1315 Spruce Street, Philadelphia. Oils No. 5 and No. 6 are specified in the Bureau of Mines—Technical Paper No. 323B. This publication can be obtained from the Superintendent of Documents, Government Printing Office, Washington, D. C. The price is 15 cents.

Properties of Fuel Oil

The properties set forth in the above specifications are primarily those which are important from the standpoint of burner operation, with limits fixed that are practical from the standpoint of the refinery operations and at the same time insure a uniformity that is necessary for satisfactory burner performance.

Flash. The flash point of an oil is the temperature at which sufficient vapor is given off, when the oil is slowly heated, to momentarily flash when a small standard flame is brought near the surface of the oil, the fire becoming extinguished instantly for lack of fuel. When the oil is heated beyond the flash point a temperature is reached at which sufficient vapor is given off to burn continuously when once ignited. This temperature is termed a fire point. These properties are important as regards the readiness with which the oil will ignite and burn. It is essential that the flash and fire points be sufficiently high to guard against dangerous inflammability, but at the same time they should be low enough so that when used in a burner the oil will ignite instantly and continue to burn.

The minimum flash point is necessary for compliance with legal requirements. Due to the very wide variations in the regulations of different States and municipalities, it is not possible to specify the flash point or instrument to be used in determining the minimum flash point because there is such a wide variation. Accordingly, the instrument and minimum flash point, as indicated by the authorities, which are legal for the locality in which the oil is to be sold, should be ascertained by the user of the specifications and be included in them. A maximum flash point is desirable in oils No. 1 to No. 4 inclusive, to take care of automatic ignition requirements. Since legal considerations do not enter here, the standard instrument and method of test given in the forms may be used.

Water and Sediment. Water and sediment in the fuel is more than a total loss; in addition to the fact that it has no heating value, it actually requires heat to bring it up to the furnace temperature. A large amount of water in the oil results in poor combustion, and there is some liability of extinguishing the flame. The amount of water and sediment is determined by centrifuging a given quantity of the oil in a standard centrifuge machine which causes the water and sediment to separate out, due to its greater weight.

Pour Tests. The pour point is the lowest temperature at which oil will pour or flow, when it is chilled, without urging under specified conditions. The oil is put into a standard test jar and tightly sealed with a cork which has a thermometer extending through its center. The temperature of the oil is brought down until the oil retains its form when inclined so the surface is vertical. This temperature is known as the solid point. A temperature 5 deg. higher than this is known as the pour point.

The pour test should be applied to oils No. 1 to No. 4 inclusive, since it is essential that the consumer be protected against wax-bearing distillates.

Distillation Range. This test is to determine the temperature at which definite percentages of oil are vaporized. The temperature at which this vaporization begins is called the "initial point"; that at which it ends is called the "end point." The initial point, or slightly beyond, is a reasonably good indication of the temperature required for a sufficient amount of vapor to form to support combustion continuously, and the end point gives a relative comparison of the temperature at which all of the oil can be vaporized and burned.

A distillation requirement is necessary for oils No. 1 to No. 3 inclusive to limit deliveries to the type of oil desired and to insure proper fluidity and volatility. Except for oil No. 1 only the 10 per cent and 90 per cent points are specified, the former to insure the proper amount of readily volatile material, and the latter to protect against excessive amounts of high boiling constituents.

Viscosity. Viscosity is the internal friction or resistance to flow offered by the individual oil particles in contact with each other or surfaces to which they can adhere. The time required for a definite amount of oil to flow through an orifice of standard size is a relative measure of the oil's viscosity. If it takes a long time, the number representing the seconds is large and the substance is said to have a high viscosity. If the substance is very fluid the time required is less and consequently the viscosity is said to be low. Heat makes viscous substances more fluid or, in other words, reduces their viscosity. Oils of low gravity are generally, though not necessarily, those of high viscosity. For example, an oil 12 or 14 deg. A. P. I. gravity in cold weather has very much the characteristics of molasses—much more so than one of the 28-30 or 38-40 gravity. Circulating the oil in contact with steam coils or otherwise heating it will thin it appreciably and generally make it easier to atomize and to handle.

Since there is no universally recognized standard instrument or method of measuring viscosity, the term means nothing unless there are also stated the names of the instruments used and the viscosity and temperature at which the viscosity was determined. Common types of viscosimeters, or instruments for measuring the viscosity of oil, are the Saybolt, Engler and Tagliabue. A Saybolt Standard Universal Viscosimeter is used almost exclusively in this country. Other viscosimeters in use are the Scott, Redwood, Pennsylvania Railroad pipet and others. The Engler viscosimeter is used extensively in Germany and the Redwood viscosimeter in England.

APPENDIX B

REPORT OF TEST ON "OIL HEAT MACHINE,"* PHILADELPHIA, PA.

Description

The Oil Heat Machine was a mechanical atomizing type of oil burner.

The machine consisted of the following principal parts:

a. A ¼ h.p. General Electric 110-220 volt., 60 cycle, A. C. 1725 r.p.m. motor.
b. An oil pump to supply fuel to the burner.
c. A metering device to measure oil supplied for burning.
d. A pressure regulating valve to maintain fuel from the pump, under pressure, through the metering device.
e. Fan and atomizing cone, and collar driven from the same shaft within the furnace to supply through centrifugal action a fine spray of oil and sufficient air for proper burning.
f. A fire brick basin beneath the fan and atomizing cone.
g. A ring gas jet burner in basin, and gas pilot.
h. Safety device.
i. Program switch controlling the operation of the machine and actuated by the room thermostat.

The moving parts of the machine were operated through a shaft coupled to each end of the motor. The fuel pump and metering device was driven from one end of the motor, and the centrifugal atomizer and fan from the other.

The operation of the machine was controlled by a thermostat located in the living room of the above residence.

When the room temperature fell below that set on the thermostat the action of the thermostat operated the "program switch" on the machine. The operation of this switch caused the motor to start, and gas to flow through the ring jet burner where it was ignited by the pilot flame. The atomized oil whirled out over the atomizing collar and in presence of the air supplied by the fan was ignited, and positive burning of the atomized fuel was obtained by the maintaining of the ring gas flame for a period of about two minutes. At the end of this time the fire brick basin was heated enough to carry on regular operation.

The fuel supply for continuous burning was obtained by the fuel pump drawing oil from the storage tank through a strainer, and forcing it under the adjusted pressure through the metering device—a stationary and movable disk with a one-eighth inch hole in each disk allowing oil to pass only when the holes coincided to the atomizing cone. The excess oil pumped was returned to the storage tank, through the return line.

When the proper temperature in the living room was attained the thermostat opened the "program switch" and stopped the operation of the machine. At the same time a governor type valve in the metering device closed the pump discharge line ahead of the two measuring disks, preventing any further flowing of oil.

Object

This test was conducted in order to determine the operating characteristics, and the season heating cost, of this type of burner.

Installation

The burner was installed in an American Radiator Company's Areo 3-23, W-Series No. 23-1B hot water boiler, to which was connected 580 sq. ft. of radiation.

The house contained eight rooms, including an inclosed porch, also a heated garage in the basement. It was located in a row, with northern exposure at the rear and southern exposure at the front. The construction was brick with frame bay windows in the rear first and second floors.

The construction for heat insulation could be classed as ordinary.

The boiler and the risers in the basement were not covered.

Method of Test

The oil consumption was obtained by depth gage measurements in the oil storage tank. This method of measurement gave readings accurate within 0.3 of a gallon.

The current consumption was obtained by an integrating kilowatt-hour meter installed in the motor circuit. The number and length of operating periods were obtained from charts of a graphic ammeter installed in the motor circuit.

The temperatures of the supply and return water to the heating system inside and outside air temperatures were obtained by thermocouples attached to a recording potentiometer. The thermocouples used for obtaining the water system temperatures were secured to the outside of the

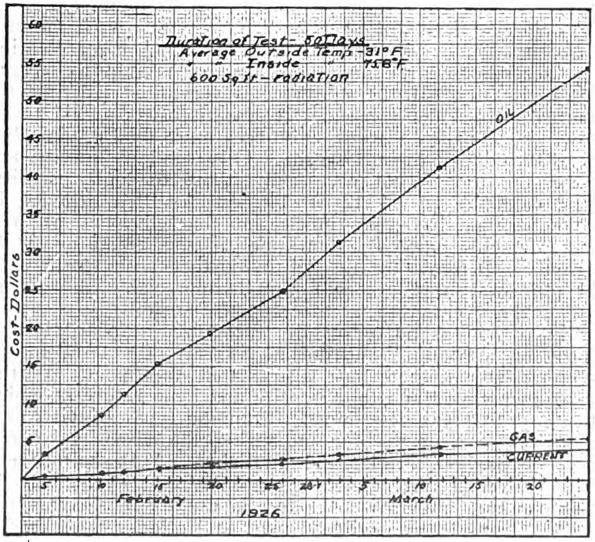

FIG. 88—TOTAL COST OF OPERATION.

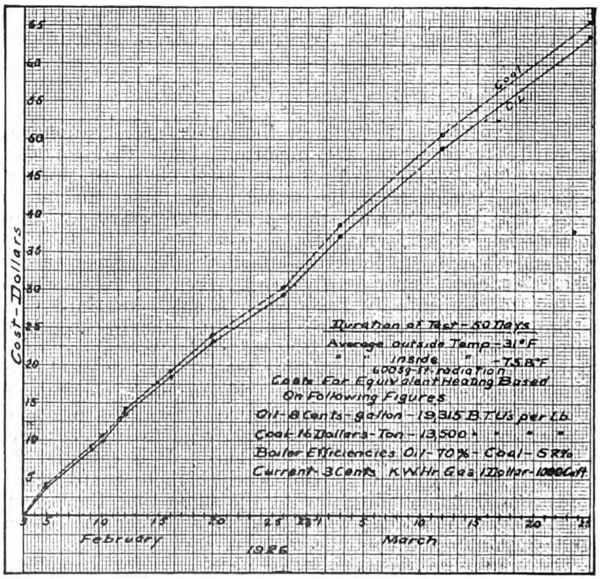

FIG. 89—TOTAL HEATING COST OIL VS. COAL.

---

*Test made by The Philadelphia Electric Company.

pipes at the boiler with cement and covered with asbestos and tape. The temperature gradient of the pipe was obtained by difference of thermocouple, and standard thermometer readings under the same conditions with the thermometer in a well in direct contact with the water.

The stack temperature was obtained by a recording thermometer, the bulb of which was placed in a stack at the connection to the boiler. The flue gas obtained from point of leaving boiler, was analyzed by an orsat apparatus. The air supplied for combustion was measured by an anemometer and wind tunnel constructed around the burner.

Several analyses of samples of the fuel burned were made in order to check uniformity of shipments.

The gas consumption was obtained by gas meter readings during the period when the heat machine only was using gas.

Record of the different temperatures and oil and current consumption was taken at intervals of four or five days throughout the test, which began 10 A. M., Feb. 3, 1926, and concluded March 25, 1926, at 10 A. M.

The date from which boiler efficiency was calculated was obtained during period March 24 to 25.

A summary of the results of the test is given in Table V of the main report.

The values in Table V are plotted in Fig. 88 and 89.

Test Data

Oil Analysis

Specific Gravity, 0.855 (33.8° Baumé)

Flash point	185° F.
Fire point	210° F.
Sulphur	1.37%
B.t.u. per lb.	19,315

Boiler Test Data 3/24/25 26

Average analysis flue gas	
CO_2—13.6%	Heating hours—14.81 Mean water temperatures—120.5° F.
O_2—1.7%	Average room temperature—73° F. Average stack temperature—620° F.

Avg. operating hours per day	10.2500	

BOILER EFFICIENCY (OIL)

(*Radiation Data*)

B.t.u.'s supplied heating system in 14.8 heating hours—544,000 B.t.u.'s.

B.t.u.'s supplied to burner—790,000 B.t.u.'s.

$$\text{Boiler efficiency } \frac{544,000}{790,000} = 68.9\%$$

BOILER EFFICIENCY

(*Combustion Data*)

	B.t.u.'s.	Per cent
Stack loss	91,900	11.64
Loss due hydrogen in oil	70,200	8.89
Radiation loss	74,000	9.37
	236,100	29.90

Boiler efficiency, 100.00—29.90—70.1%.

COST DATA

Cost over test period—50 days, from 2-3-26 to 3-25-26.
Average outside temperature, 31 deg. F.
Average inside temperature, 75 deg. F.

Oil	
Gallons burned—678.25, at 8 cents per gal.	$54.25
Electricity	
Kw-hr.—132.5, at 3 cents per hour	3.98
Gas	
Cubic feet—5576, at $1 per 1000 cu. ft.	5.58
Total cost, 50 days	$63.81
Average cost per day	1.28

Estimated cost of equivalent heating with coal at $16 a ton—2240 lb., and containing 13,500 B.t.u.'s per lb., with a boiler efficiency of 52 per cent:

Tons of coal required—4.1, at $16 per ton	$65.60
Cost per day	1.31

Difference in cost of equivalent operation over test period: Oil, 2.73%, or 3 cents per day less than coal.

ESTIMATED SEASON'S HEATING

Heating period, 210 days.
Average outside temperature for season, 40 deg. F.
Average inside temperature, 75 deg. F.
Using quantities from curve of Average Quantities:

Oil	
Gallons oil—2100, at 8 cents per gal.	$168.00
Electricity	
Kw-hr.—420, at 3 cents per kw-hr	12.60
Gas	
Cubic feet, on basis of average—111 cu. ft. per day—23,300, at $1 per 1000 cu. ft.	23.30
Total cost	$203.90
Cost per day	0.97

Equivalent Coal Heating Cost

Boiler efficiency 52 per cent—13,500 B.t.u.'s per lb. $16 per ton—2240 lb.

Tons of coal required—12.85, at $16 per ton	$205.50
Cost per day	0.98

Difference in cost of equivalent operation:
Oil—1.17 per cent, or 1 cent per day less than coal.

Estimated season's heating covering same period with average outside temperature of 40 deg. F. and average inside temperature 70 deg. F.

Oil	Total cost, $185.00	$0.881 per day
Coal	Total cost, $186.00	0.886 per day

Discussion of Results

The results obtained during the fifty days of this test indicate that the inside temperature was maintained at a higher temperature than any normal operation on coal would probably give. The operating cost of the machine shown in the cost data, therefore, is relatively higher than would be expected. However, figured on the basis of equivalent heating with coal, the cost of oil operation is less by the margin of about 3 per cent.

Boiler efficiency was figured in two ways: first, on the basis of heat transfer through radiation surface, and second, from the combustion data obtained during operating periods.

The efficiencies obtained of 68.9 per cent and 70.1 per cent respectively indicate a close check and show an operating condition under ordinary home installations that could not be obtained by coal operation without added expense and inconvenience and would be questionable there.

The boiler efficiency from radiation data was obtained by taking the mean temperature of the heating medium over the number of heating hours as shown by the thermocouple chart from the recording potentiometer, and figuring the heat omission of a square foot of radiating surface for each type of radiator, taking into account the number of sections, columns and height. From this data the average number of B.t.u.'s omitted per hour was obtained. The efficiency figured from the combustion data was obtained from analysis of flue gas samples taken during the operating periods. The average CO_2 content of the flue gas for nine samples taken was 13.6 per cent, indicating excellent combustion for the burner. A check on this percentage of CO_2 of 14 per cent excess air was obtained by measuring the air supplied per operating hour to the burner, by anemometer.

In figuring the losses up the stack and that, due to the hydrogen in the oil, values of 85 per cent carbon and 12.5 per cent hydrogen per pound of oil were assumed, on the basis of comparison between specific gravity degrees Baumé and B.t.u. per pound with the table of Chemical Analysis of similar oils.

The average figure of 0.2 of a kilowatt-hour per gallon of oil burned over the average of 10 operating hours per day, giving a current consumption of 2.0 kw-hr. per day seems to be a reasonable figure as a season's average for a home with 600 sq. ft. of radiation, and ordinary construction.

The gas consumption per season for the burner would be the same regardless of the size of the home heated. The only variation from the average of 100 cu. ft. of gas a day consumed by the pilot flame would be the number of operating periods. The gas consumption in the first two minutes of operating on starting was 2 cu. ft., representing the gas supplied to the ring jet.

The burner operated 42.7 per cent of the test period as compared to a season average of operation of 30 per cent.

Discussion of Charts

The chart showing "Total Quantities" (Fig. 90) is an accumulative chart, showing in progressive stages the total operating hours and current, gas and oil consumption through the test, and indicates a fairly uniform increase in each quantity.

The chart for "Daily Quantities" (Fig. 91) shows the variation in current and oil consumption, operating hours and outside and inside temperatures, in the form of averages for periods between readings. It will be noted that the temperature scale for this chart is inverted so that no confusion would result when observing increases in current oil and operating hour quantities during low temperature periods.

The chart indicates in its contour the effect of outside temperature on heating.

This temperature was obtained from a section of the dining room adjacent to the window and about one foot from the wall having northern exposure.

The chart showing "Average Quantities" (Fig. 92) represents the variation of the gallons of oil—operating hours and kilowatt-hours per day for periods of average temperatures ranging from 20 deg. to 40 deg. F. and for the condition of a home containing 600 sq. ft. of radiation, ordinary construction, and average inside temperature of 75 deg. F. The values plotted in these curves were obtained from calculations based on test averages and indicated an accurate curve, for, if the curves were continued along the same slope, the trio would meet at a point just beyond 70 deg. F.

The "Operation—Radiation Chart" (Fig. 93) also obtained from test averages shows the variation in quantities considered in previous charts for varying amounts of radiation, ordinary construction, and based on 70 deg. F. inside temperature, for average outside temperature of 32 deg. F. and 40 deg. F. respectively. A factor of 0.60

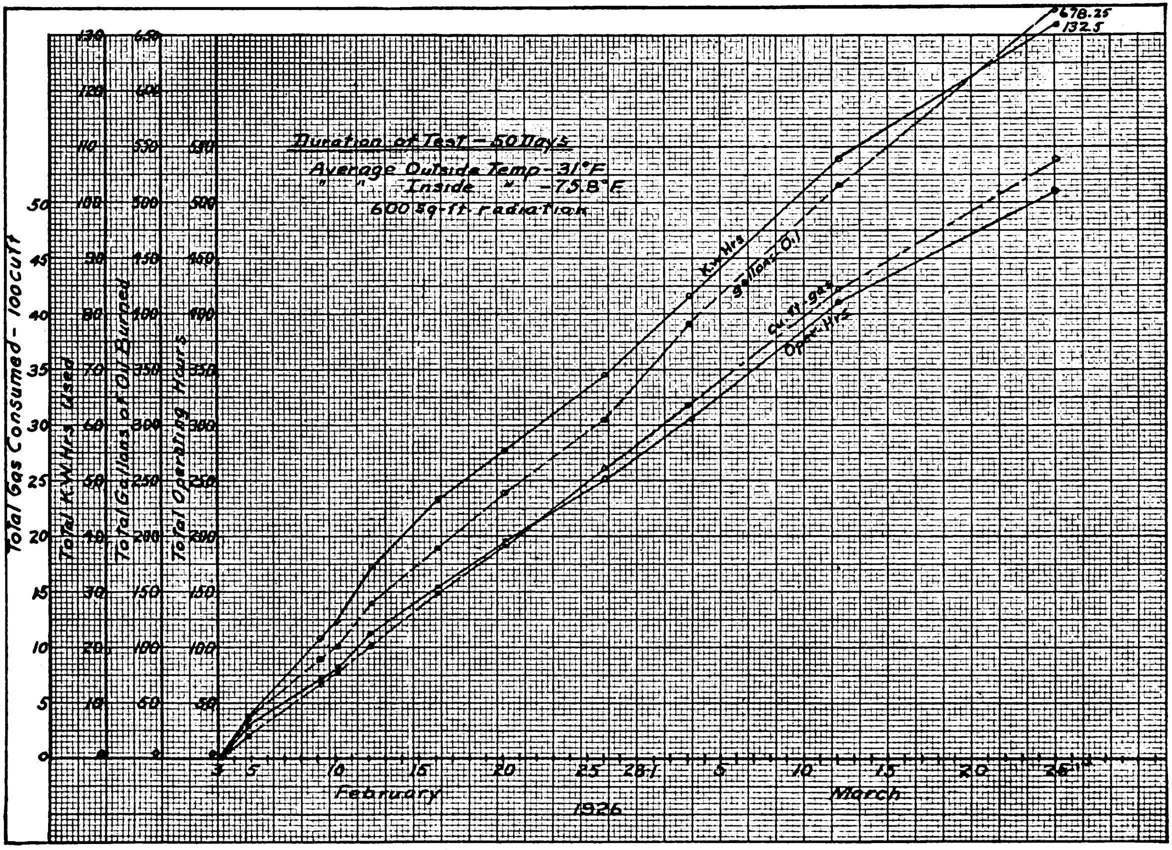

FIG. 90—TOTAL QUANTITIES.

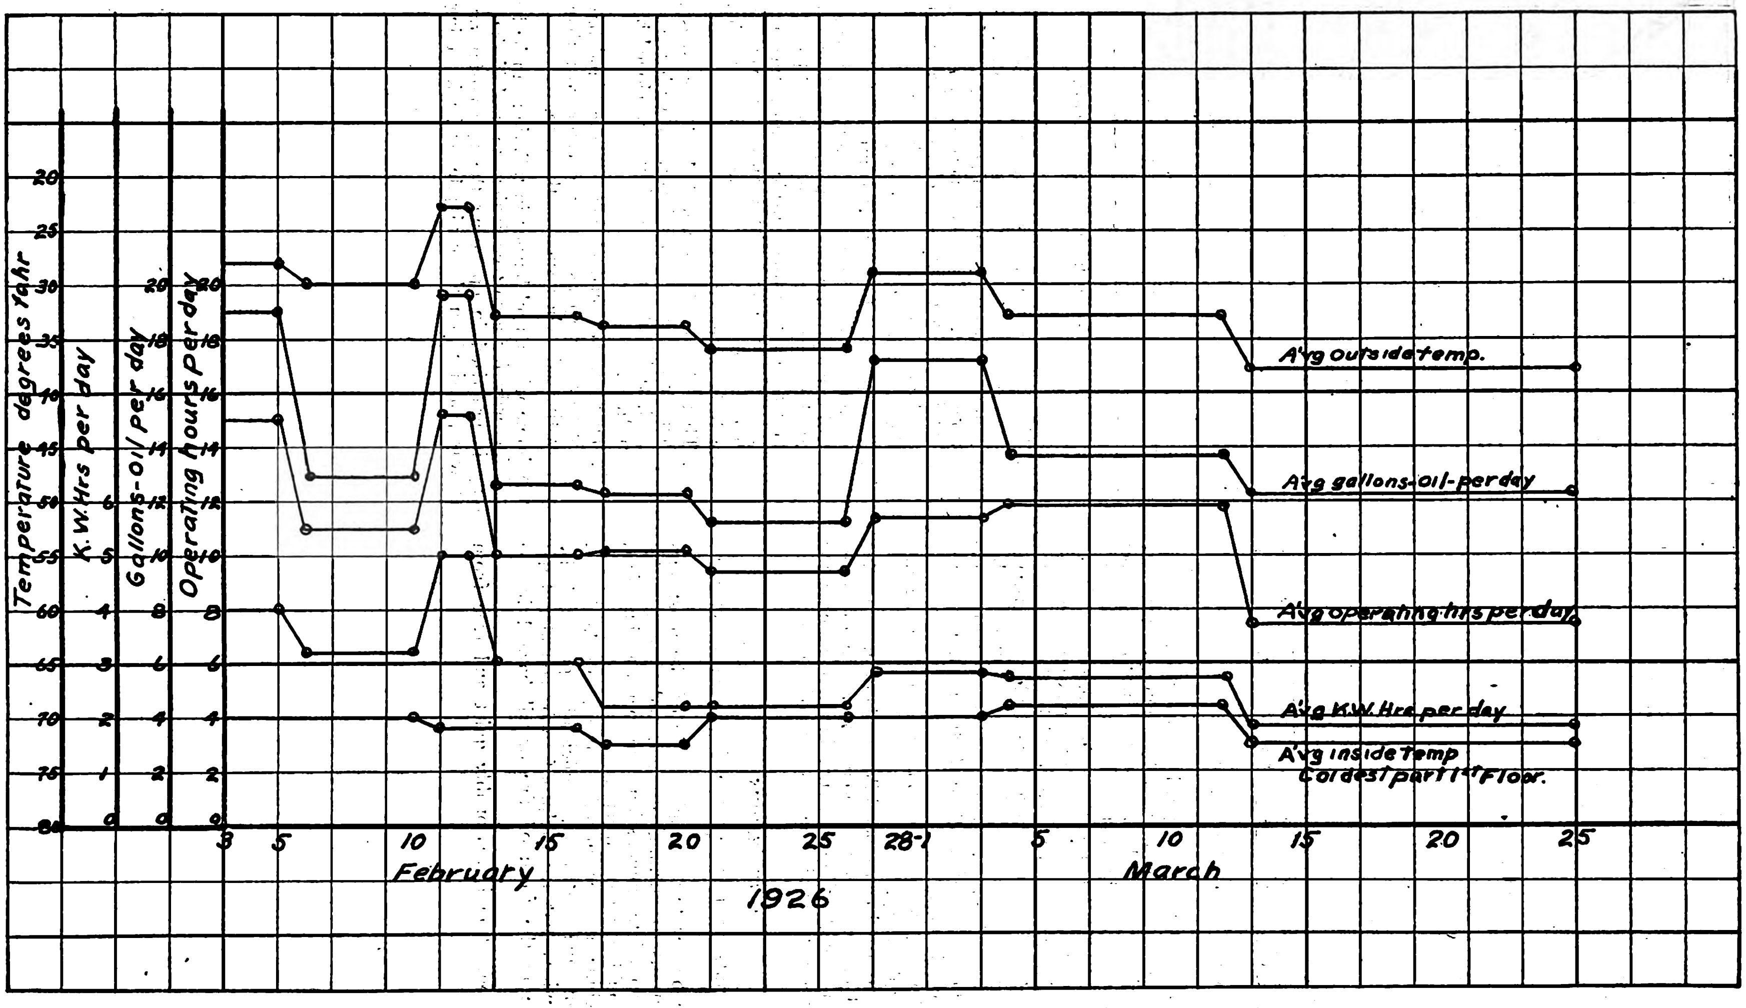

FIG. 91—DAILY QUANTITIES.

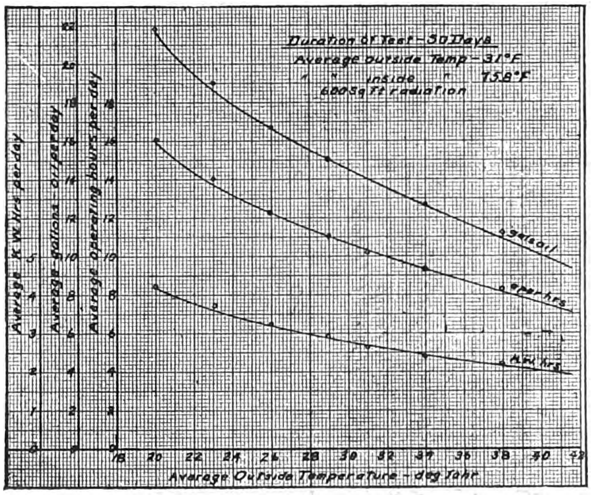

FIG. 92—AVERAGE QUANTITIES.

used for good construction applied to each curve would give quantities for the well insulated home. From the chart, then, could be figured the average heating cost per season of any residence by adding to the cost of oil and current obtained there from the cost of 23,000 cu. ft. of gas. The chart also indicates that the maximum number of square feet the oil heat machine could handle, under the condition of test operation and ordinary building construction during a period averaging 32 deg. F. would be between 1200 and 1400 sq. ft. For good construction, the burner would take care of 1800 to 2000 sq. ft. under the same weather conditions.

The chart showing costs of oil operation and oil against coal are self-explanatory.

NOTE—The rate of 3 cents per kilowatt-hour used in this report is based on the fact that homes operating oil burners would burn enough kilowatt-hours in three months for light and other uses to obtain the new rate of 3 cents.

Conclusions

From the results of this test the following conclusions are drawn:

1. That the burner tested employs one of the most successful means of burning oil fuel, and showed a degree of complete combustion that perhaps but few, if any, could equal or surpass.
2. The machine is mechanically strong, simple in arrangement and operation, sufficiently protected by safety devices that are foolproof to be considered not a menace in the form of fire or oil hazard in the home.
3. That its operation is reasonably quiet and free from odor.

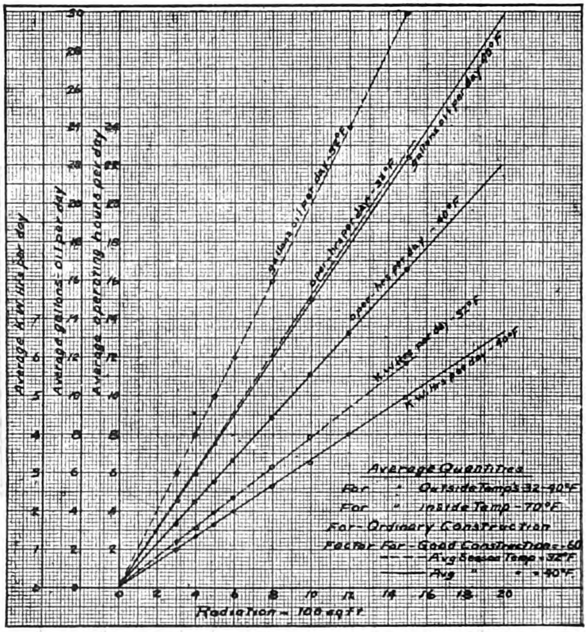

FIG. 93—OPERATION—RADIATION CHART.

4. That the economy obtained during this test could be improved if the boiler was insulated. This alone would probably increase the boiler efficiency 5 to 6 per cent. A still farther increase in efficiency could be obtained if a boiler with efficient heating surface was available. This gain would be obtained by reducing the stack loss to a minimum.
5. That perhaps hydrostatic control of the heat machine would be more preferable than the thermostatic control employed during the test. A uniform temperature of the heating medium per day would probably maintain a more uniform inside temperature per day than a heating medium that varies from very hot to relatively cold when thermostatically controlled and with a little better economy.
6. That the total electrical load per season per oil burner compares very favorably with the refrigerator load, and is deserving of being developed by the public utilities.
7. That the personal element in the home having an oil burner is responsible for greater cost than operation with coal, when such is the case.

A home with an oil burner installation can be heated more satisfactorily for a cost equivalent to coal if the same economy is practised in operating the thermostat or hydrostat as was practised on the coal pile or back saving in firing

APPENDIX D

RULES FOR FRACTIONAL HORSEPOWER MOTORS*

By a process of open discussions between all interested groups and through the workings of a cordial spirit of co-operation the joint committee on fractional-horsepower motors has obtained agreements which are expected to bring about very desirable results. In a series of meetings held during the past twelve months the committee has brought about a greatly improved situation in the industry. This committee was composed of representatives of the National Electric Light Association, the National Electrical Manufacturers' Association, the American Washing Machine Manufacturers' Association, the Association of Edison Illuminating Companies and, in addition, unorganized appliance manufacturers were represented by individuals. The committee was initiated by Prof. C. F. Hirshfeld of the Detroit Edison Company and worked with L. W. W. Morrow of the *Electrical World* as chairman.

The work of the committee dealt with improving fractional-horsepower motors through agreements as to minimum specifications for efficiency, power factor, starting current and apparent efficiency. The economic cost to the industry as a whole has been weighed and each group has contributed a share of the burden. The committee feels that its work will react to the benefit of the industry and will stabilize the fractional-horsepower motor situation for some years. It asks for the hearty cooperation of all groups in the industry so that its recommendations may be put into operation.

Summary of Action

After careful consideration the committee decided that there should be two general classes of fractional-horsepower motors, as follows: (1) Long-hour use motors. (2) Short-hour use motors. Long-hour use motors are those which operate a large number of hours per month in the aggregate and consume sufficient energy to make efficiency of economic importance. Specific applications for these motors agreed upon by the committee are electric refrigerators and electric oil burners. Short-hour use motors are those which are in operation a relatively small number of hours per month so that their consumption of energy is small. Typical applications of these motors are washing machines, dish washers and home food choppers.

MINIMUM SPECIFICATIONS FOR LONG-HOUR USE MOTORS OPERATING ON 110-VOLT, 60-CYCLE CIRCUITS AT 1800 R.P.M.

Rating in hp.	⅛	1/6	¼	⅓	½	¾
Power factor in per cent....	52	56	60	61	63	65
Efficiency in per cent.......	53	58	62	63	65	67
Apparent efficiency in per cent	30	36	42	44	47	49
Locked rotor amps..........	20	20	20	20	26.6	40
Locked rotor amps. at 75 per cent load	15	15	15	15	20	30

Minimum specifications for long-hour use motors and for short-hour use motors operating on 110-volt, 60-cycle circuits at 1800 r.p.m. as agreed on are given in the accompanying tables. The short-hour and long-hour use motors have the same current specifications and approximately the same power-factor specifications. The major difference is in efficiency values. These efficiency differences are expected to be reflected in motor prices.

MINIMUM SPECIFICATIONS FOR SHORT-HOUR USE MOTORS OPERATING ON 110-VOLT, 60-CYCLE CIRCUITS AT 1800 R.P.M.

Rating in hp.	⅛	1/6	¼	⅓	½	¾
Power factor in per cent....	50	52	56	58	60	62
Efficiency in per cent.......	41	46	51	54	58	61
Apparent efficiency in per cent	24	27	32	35	39	42
Locked rotor amps..........	20	20	20	20	26.6	40
Locked rotor amps. at 75 per cent load	15	15	15	15	20	30

NOTE.—Where the product of the minimum values of power factor and efficiency, as shown in the table, do not equal the apparent efficiency it is understood that either the power factor or the efficiency values will be increased by the manufacturer to make the product of power factor and efficiency equal to the stated apparent efficiency.

Exception for Washing Machine Motor

The values given apply to all 4-pole, 110-volt, 60-cycle fractional-horsepower motors with the exception of the washing-machine motor. It must conform to efficiency, power factor and apparent efficiency specifications, but not to locked rotor ampere values. After careful study the joint committee felt that time should be given for working out the washing machine problem and it agreed that the washing machine situation warranted, for the present, an exception in regard to the locked rotor ampere values for all other applications.

The ¼-hp. long-hour use motor should meet these specifications as of Jan. 1, 1928. Motor manufacturers agreed to develop the other sizes and types to meet the specifications as soon as possible and an ultimate date of Jan. 1, 1929, was agreed upon as the time all new motors should conform to the new specifications. Motors characterized by these specifications represent a great improvement on existing motors and necessitate a complete redesign of the majority of fractional-horsepower motors now made. The time element was considered a minimum in view of the time required to redesign, retool and get production in factories.

These specifications apply to motors which are normally connected to lighting circuits and which may be expected to operate at times during lighting hours. The values given are minimum values obtained by test after the motor has operated a reasonable time (at least 24 hours) to limber it up. It was agreed upon as desirable that motors of the 1800-r.p.m., ¼-hp., 110-volt, 60-cycle size should be produced as soon as possible with a full-load efficiency of at least 70 per cent and a full-load power factor of 65 per cent, giving an apparent efficiency of at least 45.5 per cent. It was thought such motors for refrigerators and oil burners would be justified in price by capitalizing the cost of energy used as compared to a cheaper but less efficient motor.

The joint committee adopted the new specifications for use in this country. Motor manufacturers are committed to an expense of upward of $1,000,000 in redesign and retooling costs. The utilities promised to do their part toward securing the use of the proposed motors and to urge that all central-station companies adopt uniform rulings in agreement with the recommendations of the joint committee because the use of present motors seriously affects utility service. Appliance manufacturers promised to follow the specifications and principles agreed upon by the joint committee.

The report of the committee was submitted for approval to the associations represented on the committee and already has the approval of the majority of the individual appliance manufacturers. The joint committee believes prompt action should be taken by the parent organizations and that, if approved, this report be distributed to each member so that he may be guided by the committee findings.

*Reprinted from *Electrical World*, Feb. 18, 1928.

THE ELECTRIC FARM EQUIPMENT MARKET

AS INDICATED BY AN ANALYSIS OF THE TERRITORY SERVED BY THE NORTHERN STATES POWER CO.

Introduction

Rural electrification has developed to a point where one of its most important problems is "How to build the load." Obviously this is a merchandising as well as a service or promotional problem, and for that reason a solution is being sought through the joint efforts of the Merchandise Sales National Committee and the Rural Electric Service National Committee.

At the September, 1928, meeting of the latter Committee, Marshall E. Sampsell, Chairman of the Commercial National Section, presented a plan for a closer working arrangement. As a result of the discussion, the Electric Farm Equipment Subcommittee of the Merchandise Sales Committee was formed with three members appointed from the latter Committee and two from the Rural Electric Service Committee. In the words of Mr. Sampsell, "the sole purpose of such Subcommittee is to devise ways and means of merchandising current-consuming devices for the farm." The Subcommittee was also requested "to consider for such sales purpose the entire farm operation including the home."

The Subcommittee realized from the beginning that its work is effective only to the extent that it stimulates increased action along proper lines in utility company organizations. Its efforts are intended to help those companies who wish help in selling more of the proper farm electric equipment.

To bring the problem and any possible solutions more directly to the attention of operating executives, the National Subcommittee urged the formation of similar organizations in each geographic division. It was also recommended that such division Subcommittees should include a commercial man and a rural service man from each State, so as to insure the closest possible cooperation between the two groups everywhere. These geographic division Subcommittees are already pretty well organized, and the idea has also spread to some State utility associations.

Sales Requirements

Since farm electrification is a new development in our business, the Subcommittee believes that it calls for specialized attention, and that specialized men are required to handle it.

The Subcommittee also feels that the promotional, development and engineering work of rural electrification is properly the duty of a separate rural service department, but that the merchandise department which actually sells the farm equipment also needs men with extensive experience or training, and with such up-to-date and authoritative information that they can talk to the farmers about almost any phase of electric service for the farm.

The Subcommittee, therefore, strongly recommends that any utility which desires to successfully develop rural electrification divide the work into two parts, namely:

1. Rural service development or new business development.
2. Actual selling of farm electric equipment.

The National Rural Electric Service Committee of the N. E. L. A. has made a number of recommendations concerning the duties of rural service departments, and it does not fall within the scope of this Committee to deal with them, but the success of merchandising to farmers depends in no small measure on how well the rural service department carries on its part of the work.

The second part, or the merchandising of farm electric equipment, is strictly a merchandising job and is the job in which this Subcommittee is chiely interested. Naturally, someone must contact the farmers if merchandise is to be sold, and the first question is what kind of a man should be hired to carry on this work?

He should have sales ability—for his chief function is to sell merchandise to farmers. Inasmuch, however, as the farmer is not as familiar with utilities as are the urban people and has not had as much experience with electrical devices as has his city neighbor, and inasmuch as the farmer has many varied uses for electric service, this man should be more than an ordinary salesman if he is to get results.

He should be familiar with the company's rules, wiring policies and requirements, and he should understand the fundamentals of the public utility business, for the farmer is surely going to ask him many questions about the company. He should have a general understanding of farming and be able to discuss intelligently improved farm methods. He should be well informed on the practical uses of electricity on the farm, and he should keep up-to-date on this subject by reading the great mass of material that is available. He should remember that he is talking about a new kind of power to a group of people who are not familiar with it, and he should exercise a great deal of patience and diplomacy.

This Subcommittee appreciates that these are the specifications for a rather high-grade man, but it believes that such a man is necessary at this time in the selling of farm electric equipment.

The second question that will arise is how many of these rural service men should be employed. The Committee recommends that there should be at least one such man for every 500 farm customers. A larger number than this is necessary in the beginning of an intensive rural electric development pro-

---

Publication No. 289-92, Serial Report, Merchandise Sales Committee.

gram. It is recommended that eventually there be such a man in each district office where the company does business in rural territory.

SUGGESTED DISTRICT ORGANIZATIONS UNDER DIFFERENT CONDITIONS

Amount of Farm Business Connected or in Prospect	Development Work Handled by	Sales Work Handled by
Very little	District Manager	District Manager
Less than 300 customers	District Manager	½ Salesman
Over 300, less than 600 customers	District Manager	1 Salesman
Over 600 customers.	Rural service specialist.	1 or more salesmen.

As a source of some of the data on rural electric service which everyone connected with this development requires, the National Subcommittee has undertaken to supply to the Division Subcommittee the best literature on this subject. This consists of the bulletins, pamphlets and periodicals giving the most accurate, complete and up-to-date information. It then becomes the duty of the Division Subcommittees to bring such material to the attention of county agricultural agents and others interested in the best agricultural development. And it should be the duty of rural salesmen and service men to familiarize themselves with the following material:

1. At least one national farm paper.
2. Agricultural Engineering, a local farm paper, or Electricity on the Farm.
3. The C. R. E. A. Bulletins and News Letters, especially Vol. 4, No. 1, entitled "Electricity on the Farm and in Rural Communities."
4. The reports of State experimental projects.
5. Agricultural bulletins on electric service, water supply, etc.
6. The N. E. L. A. pamphlets entitled "More Power to the Home."
7. Home Equipment Primer, Part 2, issued by the General Federation of Women's Clubs.
8. Manufacturers' data bulletins and installation directions.

What, When and How to Sell

The next question is what electric farm equipment to sell and how and when to sell it. And this is a problem that can best be handled by the geographic division Subcommittees. For selecting the equipment best adapted to the various farm jobs in each geographic division, it is urged that the Subcommittee and the Rural Electric Service Committee hold joint or cooperative meetings. All members of both Committees should bring in their recommendations and criticisms of the competing machines now on the market, and the group should decide upon an acceptable list of equipment, giving

Trade names
Manufacturers
Size
Capacity
Operation details
Power requirements
Installation features.

Such accepted lists should be made available to all member companies of the division. They should also be reported to the National Subcommittee accompanied by the definite, specific and detailed reasons why other existing equipment was not included. The National Subcommittee will act as a clearing house for this information and will offer constructive criticisms to the manufacturers who wish to eliminate the objectionable features of their products.

Rural salesmen and service men and all others having intimate contact with actual farm needs can aid in this work by reporting the performance of new devices as well as the requests and possibilities for equipment not yet developed.

It is also recommended that the geographic division Subcommittees discover and report the most outstanding examples of success in selling farm equipment that have been attained by companies in each division. In this connection it is important that the particular point of excellence as to organization and methods be reported. The National Subcommittee will digest these reports and make them available.

Data Available for Analysis

Intelligent merchandising of electrically operated equipment to the rural field involves specific and detailed knowledge regarding types of agriculture, financial ability of the farmer, natural purchasing seasons and buying habits of the prospective customers. Fortunately, there is a large amount of statistical information available which, when digested, analyzed and summarized, will yield important information for the merchandise manager and salesman. To be most effective this information should be worked up for the individual company's territory. The primary sources of statistical agricultural information are as follows:

1. U.S. Census of Agriculture: 1925, issued by the U. S. Department of Commerce, Bureau of the Census, Washington, D. C.
2. "Statistical Guide to the 'Other Half of America's Market'," obtainable from Wallace C. Richardson, Inc., 250 Park Ave., New York, N. Y., and Standard Farm Papers, Inc., 307 N. Michigan Ave., Chicago, Ill.
3. Other State and national agricultural papers.
4. The State Departments of Agriculture.
5. Agricultural experiment stations and agricultural extension divisions.

The statistical information used in the following analysis was obtained from No. 1 and 2 above and "Northwestern Farm Facts and Figures," published by "The Farmer," St. Paul, Minn. The compilation was made by the rural electric service department and the rates statistical department of the Northern States Power Co., Minneapolis, Minn. As shown on the accompanying map (Fig. 1), this company and its subsidiaries operate in five States, Minnesota, Wisconsin, North Dakota, South Dakota and Illinois, through thirteen division offices, several of which are subdivided into districts. To simplify the method of presentation, the analysis is here shown for only two of the thirteen divisions, the Fargo Division of the Union Light, Heat & Power, which is a subsidiary company of the Northern States Power Co., and the Southwestern Division of the Northern States Power Co. Agricultural statistics are presented on the basis of county units which makes it possible to analyze the sales possibilities by counties and then, through a combination of this information, build up the merchandising possibilities by divisions and, by combining the division information, develop it for the company as a whole. The territory of the Northern States Power Co. and its subsidiaries covers approximately 42,000 square miles, embracing 69 counties with approximately 168,000 farms. In this territory, between eight and nine thousand farms have central station service.

FIG. 1—MAP OF NORTHERN STATES POWER COMPANY.

The two divisions here considered are in the territory which agricultural analysts classify as the North Central Dairying Section. While these two divisions are in the same general agricultural territory, an analysis of the statistical information clearly shows that there is a divergence in the agriculture, so much so in fact as to suggest some difference in merchandising policies for developing the farm markets. In the Fargo Division the farm income is derived chiefly from the sales of grain crops and potatoes, while the Southwestern Division is much more of a livestock region, although there is a sizable income from the sale of grain crops.

Table I shows that a large percentage of the population lives on farms, in fact, there is only one city, Fargo, of over 10,000 population and only two other cities of over 5000 population. According to the census classification which lists all cities and towns under 2500 as rural, there are only six cities and towns classed as urban and 37 cities and towns

TABLE I

DISTRIBUTION OF POPULATION

(Northwestern Farm Facts and Figures)

	Population		Farm Population in PerCent of Total	Number of Cities and Towns					
	Total	Farm		500 to 1000	1000 to 2500	2500 to 5000	5000 to 10000	10000 to 15000	15000 and over
FARGO DIVISION	92 166	35 478	38.5	4	3	1	1	--	1
Becker, Minn.	25 124	13 318	53.0	1	1	1	--	--	--
Clay, "	22 992	10 116	44.0	3	1	--	1	--	--
Class, N. D.	44 050	12 044	27.3	--	1	--	--	--	1
SOUTHWESTERN DIVISION	138 164	79 459	57.5	21	9	3	--	--	--
Chippewa, Minn.	17 003	8 036	47.3	3	--	1	--	--	--
Lyon, "	20 603	9 301	45.1	3	1	1	--	--	--
McLeod, "	21 437	12 204	56.9	2	1	1	--	--	--
Redwood, "	22 313	13 026	58.4	3	1	--	--	--	--
Renville, "	23 923	14 934	62.4	5	3	--	--	--	--
Sibley, "	15 688	10 864	69.3	4	1	--	--	--	--
Yellow Medicine	17 197	11 094	64.5	1	2	--	--	--	--

between 500 and 2500 classed as rural. This indicates that when the territory is developed electrically it is necessary to have a rural merchandising policy to meet the situation.

Table II shows that the average size of the farms in these two divisions is relatively large, with a consequently low density per square mile, varying from 1.40 for Cass County in the Fargo Division to 4.97 in McLeod County, Southwestern Division. The farm land area in per cent of total county area in these two divisions varies from 53.7 per cent Becker County, Fargo Division, to 96.8 per cent in Yellow Medicine County, Southwestern Division.

Analysis of Fargo Division

An analysis for the Fargo Division of the data presented in Tables III and IV shows the following: From the standpoint of income, dairying is an important activity which insures these farmers a regular monthly income. Butterfat is the chief product sold, and there are 16 creameries in this territory. It is evident that a larger percentage of the farmers' income in Becker County is derived from dairy products than is the case in Clay and Cass Counties. Clay and Cass Counties market some whole milk, the majority of it undoubtedly going to Fargo.

In only one county, Cass, is swine production of importance.

Sheep husbandry is of decidedly minor importance.

It is evident that, generally speaking, poultry products are of minor commercial importance. From the data it can be assumed that these are used in the main for home consumption.

There is some income from the sale of livestock, chiefly cattle and hogs.

The most important source of income is from the

TABLE II

cash crops, wheat, barley, potatoes and rye. The corn, oats and hay produced are used mostly for livestock feeds.

This is a great potato region. This means that the income from crops will be concentrated from the fall, through the winter, and on into the spring, when these various products are marketed.

Table V shows that one of these counties, Cass, ranks very high as to farm value, farm income and consequently farm purchasing power, while Becker County is correspondingly low in these factors, with Clay County ranking very well, leading to the direct conclusion that sales efforts can be much more profitably expended in Clay and Cass Counties than in Becker.

The information in these statistics can be supplemented by certain significant facts obtained from a personal knowledge of the territory:

Turkey raising is developing and probably will become of major importance.

Butterfat in large quantities is being shipped to commercial creameries located outside of the territory, which indicates that more creameries will probably be established.

Dairying is on the increase.

A goodly percentage of the crop is sold for seed in southern markets.

There are practically no farms which specialize in producing poultry products. This further substantiates the conclusion that the poultry raised is chiefly for home consumption.

As a rule, specialized farming is practised, and over a period of years is profitable.

Cass and Clay Counties furnish a larger percentage of Master Farmers than the average county within the company territory.

Becker County is a summer resort region with numerous lakes.

Because such a large percentage of the farmer's income is obtained from cash crops, there are years when he is much more prosperous than others.

From the above analysis it is evident that the chief outlets for electrical equipment will relate to household uses, water pumping, dairy operations and potato grading and handling.

Cass and Clay Counties offer far more promising sales territory than is the case in Becker County.

There is some monthly income from the dairy industry which will be used to pay monthly operating expenses, including the bill for electric service, and might suffice for monthly payments on minor electrical appliances. However, the major part of the farm income to be used for the purchase of electrical appliances will undoubtedly be obtained from the cash crop income which is available at irregular intervals from October until spring work opens. These facts indicate that it is particularly desirable to keep a close watch on the conditions of the crops in the territory, and plan major sales campaigns when crop prospects are good and slightly ahead of the season of the year when the major farm income is received. While the monthly payment can be used for small sums, it is entirely possible that where sales are not made for cash, major payments should be arranged to coincide with the time when the farmer's major cash income will be received. This will involve the use of notes.

Analysis of Southwestern Division

A similar analysis of the Southwestern Division shows the following: From Table V, it is evident that with the exception of two counties, McLeod and Sibley, the Index of Purchasing Power and average income per farm are high, indicating that when this district is electrically developed it will be promising territory for the sale of electrical equipment. However, there are compensating factors in McLeod. The density of farms, 4.97 per square mile, and the number of cows milked, 26,649, producing 13,297,851 gallons, an average of 499 gallons per cow, clearly indicate that its possibilities for electrical development are relatively greater than the general income figure would lead one to believe.

In four of the counties in this division, Lyon, McLeod, Redwood and Renville, dairying is of major importance.

On the average, swine production is of more importance in the farm income than was the case in the Fargo Division.

Sheep husbandry is of minor importance.

While it appears that the average number of chickens per farm is not large, indicating that this is on the farm flock basis, there will be some income derived from the sale of eggs and poultry.

Dairy products are sold chiefly in the form of butterfat as indicated by the number of creameries, 58 in the division. In McLeod County the sale of whole milk is important.

The amount of dairying and general livestock production in this territory indicates that practically all the corn, oats and hay raised is fed to livestock on the farms. On the average, the income from the sale of the cash crops, wheat, barley, rye, potatoes and flax, while large enough to be an important factor, particularly in Renville and Yellow Medicine Counties, is relatively less important than was the case in the Fargo Division.

Index of Purchasing Power

The Index of Purchasing Power mentioned above and shown in Table V for each county considered depends on the income per farm and the value of land and buildings. In combining these two factors it has been necessary to set up an index for each of them. The index of land and buildings per farm is the ratio, expressed as a percentage, between the average value per farm in each county and $8,350, which is the national average. Expressed as a formula, this becomes: Index of land and buildings

$$\text{value} = \frac{\text{Value per farm}}{\$8{,}350} \times 100$$

Similarly, the index of farm income is the percentage relationship between the average farm income of the county in question and the average for the nation as a whole which is set at $2,350. Thus,

$$\text{Index of income per farm} = \frac{\text{Income per farm}}{\$2{,}350} \times 100$$

The index of purchasing power is a weighted average of these two index numbers. Since the value of land and buildings represents borrowing power, while the actual income may be more readily used for purchases, the index of farm income is arbitrarily made twice as important as the index of land and buildings value, and is counted twice in making the weighted average.

The formula is:

Index of purchasing power —

$$\frac{(\text{Index of farm income} \times 2) + \text{Index of land \& bldg.}}{3}$$

In addition to the statistics cited, personal investigations reveal the following facts about the Southwestern Division:

1. Several centers for the intensive production of chickens have been developed under the supervision of able hatchery men whose interest is to extend their services to the farm flock.
2. Sweet cream is shipped from McLeod County to very remote markets.
3. The western portion is developing rapidly toward diversified farming, with possible heavy swine production in the future.
4. Most of the farm homes in this territory are above the average for the country.
5. A large number of champion butter makers have come from these counties, thus indicating pride in the dairy industry.
6. The majority of the butter made is sold through the Land-of-Lakes Cooperative Association.
7. The water table from which the domestic water supply is obtained is relatively deep.

From the above analysis, the following general facts regarding the sale of electrically operated equipment appears. This division promises a field of increasing importance for the sale of dairy equipment. There are possibilities of encouraging increased attention to the farm poultry flock, thereby opening up additional sales possibilities. Water pumping equipment will be required. There should be a large demand for deep well pumps. There is every indication that the farmer will be interested in electrically operated household equipment.

It is obvious that in this district, particularly in McLeod County, the monthly payment may be the most desirable form of time payment, as a large percentage of the income is obtained from dairy products. But an optional payment plan involving the use of notes will be of advantage on many farms where the income from cash crops is spread over the period from October to March. As the farm income in this territory is fairly regular, reaching a high point in the fall and winter months, a year-round selling program is desirable with an increase of intensity beginning in August and September, and extending through January.

PROMOTIONAL RATES

General

An examination of a large number of rates in cities throughout the country indicates a rather definite movement toward the establishment of follow-on rate schedules to encourage use. The data available from various sources indicates that the consumption of electricity for residential users where there is no electrical cooking and water heating, amounts to about 460 kw-hr. per annum or a little more than 1 kw-hr. per day. The necessity of increasing the number of kilowatt-hours used by residential customers need no argument.

Electricity in the home is such a small portion of the family budget as compared with many other minor expenditures of the family that an increase in the amount of electricity used in the home would only have beneficial results.

The essential point is that the rate for electricity used in addition to normal use must be low.

The primary use of electricity in the home has been for lighting purposes. The increasing use of adequate, as well as ornamental lighting, is desired by the householder, and in using a promotional or follow-on rate the charges for the first block of energy never vary, so that when the householder desires to use appliances of any description, such a schedule encourages the use of these devices at prices the customer can easily afford to pay. When the customer once understands the relatively small portion of the bill included in the first or first and second steps, it is easy to show him that further use of electricity is at the lower rate, and only moderately increases the total cost, whereas with the straight line meter rate in effect the customer notices that adding appliances of any description makes a definite and proportionate increase in his monthly bill. The effect of this is to discourage the rapid acquisition of appliances for convenience and labor saving.

The practice of some companies of reducing maximum rates where they are already relatively low is deplored. Every time this is done it merely passes more of the burden to the customer who desires full use of electricity in his home.

From the company's point of view the follow-on rate is a reduction not in the price for the normal amount of electricity that the customer would use and pay for anyway. The follow-on rate is not a reduction in the company's income. The follow-on rate is a lower rate for some kilowatt-hours that the customer would not otherwise use. We know of no more constructive work for central station companies than increasing the use of electrical appliances in the home. There is nothing that will add more to the ease and pleasure of living than making it possible for the householder to use more electricity at a lower average rate.

Examining the rates printed in the N. E. L. A. Rate Book gives a definite picture to anyone interested as to the general situation in the industry, and we think emphasizes the desirability of more standardization of form.

Various Types of Rates

Straight Line Meter Rate

The term "straight line" indicates that the price charged per unit is constant; that is, does not vary on account of an increase or decrease in the number of units. This is the simplest of all rates.

This rate is based on a flat rate per kilowatt-hour, and under no circumstances could it be considered as encouraging the use of electricity, unless the rate were so low that it is out of line with the usual charges in such rates, as expressed in the N. E. L. A. Rate Book.

There are some cities having a flat rate of 5 cents per kw-hr. which show a comparatively satisfactory use of electricity per residential customer; but even in such instances we believe a follow-on type of rate would have decided advantages because if at 5 cents per kw-hr. the customer in these cities will use 600 kw-hr. per annum, it would seem almost certain that a rate of 3 cents per kw-hr. for additional use would sell even more kilowatt-hours.

Even in places having a low straight line meter rate there is no reason why an alternative follow-on rate should not be used to take care of those customers who desire to use greater quantities of electricity. In many instances the average rate in cities having a follow-on form is lower than even the low types of straight line meter rates enjoyed in certain cities.

Step Meter Rate

The term "step" indicates that a certain specified price per unit is charged for the entire consumption, the rate depending on the particular step within which the total consumption falls each month.

It seems to your committee that the disadvantages of the step meter rate are so outstanding that step rates should not be encouraged. It is an irritation to a customer to realize that he can never pre-determine his rate, and in many instances this form of rate is practically equivalent to a straight line meter rate, as the top step is frequently so high that ordinary uses of electricity in the home would not bring the customer outside of this block.

Block Meter Rate

The term "block" indicates that a certain specified price per unit is charged for all or any part of a block of such units, and reduced prices per unit are charged for all or any part of succeeding blocks of units, each such reduced price per unit applying only to a particular block, or portion thereof.

An examination of the N. E. L. A. Rate Book has brought out the fact that out of approximately

---

Publication No. 289-93, Serial Report, Promotional Rates Committee.

300 companies listing residential rates, half of them are practically straight line meter rates, although many of them are classed as "block" rates. Study of many of these schedules indicates that the first step of a block rate is so broad that it is impossible for a residential customer to secure a lower rate for even what is now considered large use. For instance, there are few cities, except where electric cooking and water heating are included, which use to exceed an average of 50 kw-hr. per month, and the average is nearer 30 kw-hr. So that in using a rate of the block type, which has wide first and second steps, it does not appear that there is any advantage in that kind of a set-up. It might just as well be a straight line meter rate.

Flat Demand Rate

The term "flat demand" applies to a charge for electric service based upon the customer's installation of energy-consuming devices. This is usually so much per watt or per kilowatt per month or per year. Sometimes this type of rate is nominally so much per customer per year or per month, for each of the various classes of customers. Several years ago it was believed that the flat demand rate should not be used, but recently this type of rate has come into use for small residence customers in some sections of the country.

Service Charge Rate

For quite a number of years the "service charge" rate was looked upon as a disturbing form of rate, particularly where the charge per month per customer was called a "service charge." In some parts of the country this form of rate has come into use as an alternative form with considerable success, notably in northern Indiana, where such rates have been used as alternative to straight line meter rates. Such rates are being recommended by some commissions, for instance, Massachusetts.

This form of rate also has the advantage of being able with proper working out of follow-on blocks after the service charge to permit serving all classes of customers, including those using electricity for cooking and water heating, refrigeration, etc.

Example:

$1 per month per customer, or $12 per customer per year, followed by block steps of—

7c. per kw-hr. for the first 30 kw-hr., and in some instances further steps at lower charges.

Wright Demand Rate

The term "Wright Demand" applies to that method of charge in which a maximum price per unit is charged for a certain amount of energy, depending on the number of rooms, floor area, or maximum demand or connected load, etc., and one or more reduced prices per unit, or charge for the balance of the electricity used.

Examples:

10c. per kw-hr. for electricity used equivalent to, or less than, the first 30 hr. use per month of the maximum demand,

5c. per kw-hr. for additional electricity used equivalent to, or less than, the next 30 hr. use per month of the maximum demand,

3c. per kw-hr. for electricity used per month in excess of the equivalent of 60 hr. use of the maximum demand.

The Wright Demand rate served its purpose well over a long period of years, and so long as lighting was the principal use for electricity in the home, this type of rate did a good job. The difficulty came when appliances appeared in larger numbers in the home, and the question of continuing to determine the demand by demand meters made the costs so heavy that the meter measurement of demand was discarded. The result was the establishment in some places of a percentage of the connected load, based only on the lighting installation. But even here difficulty was found from the fact that modern use of electricity occasioned rapid changes in the lamp installation in the home, which upset the company records and changed the basis of the charges month in and month out, making it a very expensive form of rate to apply.

Many of the companies formerly using the Wright Demand form of rate have gone to the floor area or room basis for the primary charge, establishing these as alternative rates until the time when all of the customers can be put over on the new rate, with increasing uses of electricity. These forms can also be considered as in the Wright Demand rate class.

Block Hopkinson Demand Rate

A demand charge based on a maximum demand per kilowatt-hour, plus a follow-on block rate.

Examples:

$2.40 per month per kw. for the first 50 kw. of the maximum demand in the month.

$2 per month per kw. for the excess of the maximum demand over 50 kw., plus an energy charge of 5c. per kw-hr. for the first 1000 kw-hr. used per month, and

3c. for the next 4000 kw-hr. used per month, and further block steps where desired.

This form of rate can be built to home use, but it has had very little, if any, acceptance.

The difficulty in the use of this form of rate is the necessity for installing a demand meter (which is expensive) if a proper record of the customers demand is to be kept. It is obvious that it would be difficult to assume a demand based on any predetermined factor. So that it is not likely that this form of rate will have very much acceptance for domestic applications.

Three Charge or "Doherty" Rate

Any of the foregoing types of rates may be modified by the addition of a customer charge. When such a charge is introduced in the Hopkinson Demand Rate, it becomes a Three Charge Rate or "Doherty" rate, which consists of a customer, or meter, charge, plus a demand charge, plus an energy charge.

Many people consider that, theoretically, this is an ideal type of rate.

The principal objections to it are that the charges are in three classes—customer charge, demand charge and energy charge.

Floor Area Rate

A flat charge based upon the square foot of floor area in the house plus a block rate per kilowatt-hour. This is, in principle, the same as the Hopkinson Rate except that the demand is determined from the floor area instead of by a demand meter.

Examples:
- $1 per month for the first 1000 sq. ft. of floor area 4c. per 100 sq. ft. in excess of 1000 sq. ft., plus an energy charge of—
- 7c. per kw-hr. per month for the first 40 kw-hr., and follow-on blocks at lower charges per block, depending on the circumstances.

or
- 9c. for the first 3 kw-hr. per 100 sq. ft. of floor area,
- 5c. for the next 6 kw-hr. per 100 sq. ft. of floor area, and
- 3c. for the excess.

In the application of this rate in most instances, basements, pantries, closets, hallways and bathrooms are not counted in the floor area.

Room Rate Charge

- Blank kw-hr. per active room for the top rate per kw-hr.
- Blank kw-hr. per room for the next block rate per kw-hr.
- and following blocks where it seems desirable.

Example:
- 10c. per kw-hr. per month for the first 3 kw-hr. per counted room.
- 7c. per kw-hr. per month for the next 3 kw-hr. per counted room.
- 4c. per kw-hr. per month for the excess over 6 kw-hr. per counted room.

A modification of this rate can be as follows:
- 20c. per month per counted room plus a block rate with several steps for the energy charge, or a further modification of—
- 12c. per kw-hr. for 3 kw-hr. per room for the first 2 rooms, and 2 kw-hr. per room for the excess over 2 rooms, with follow-on rates of 8c. and 5c. per kw-hr.

This room rate form is also having increasing acceptance because of its follow-on feature. It is superseding in many locations the older forms of rates. It is particularly advantageous in large cities, where people live in apartments, because the real estate rating established by the local real estate boards are used as the criterion of the number of rooms, upon which the primary charge is based.

Both the floor area form of rate and the room basis present possibilities for accomplishing this result satisfactorily for all concerned. Practically no trouble is found with either, once it has been adopted and used for a year or so. In cities and towns where the people live in individual homes the floor area basis is practical. While it is not so practical in large cities where people live in apartments, the same general results can be obtained by the proper application of any of these forms of rates in accomplishing the results desired.

The floor area is usually obtained by making deductions from the outside dimensions of the building, and this procedure is sometimes difficult in the case of apartment buildings.

The room basis charge is a stabilized method of determining the primary charge to the customer, as it is very seldom that rooms are added to existing occupancies. The regular real estate rating of the number of rooms in a home is acceptable as the proper basis for room count. These methods of basing residential rates do not interfere with the use of any of the electrical devices commonly used in the home, and these rates can also be modified to include electrical cooking and water heating where desirable.

A detailed examination of the Rate Book of the National Electric Light Association indicates a great many rates in addition to those above outlined. Most of these are quite apparently based on the individual ideas of some employee of a company who has been asked to give some attention to the rate subject.

The committee has no quarrel with the development of individual ideas. If individual ideas were to be forbidden and no experiments tried, our industry would come to a dead stop. Compulsory standardization is another form of saying: "You must not progress any further." Standardization and simplification are apt to be evils in themselves, and are justifiable only when what is adopted as a standard is better than what is non-standard, and only when what is simple is better than what is not so simple.

Simple Forms Recommended

But on the other hand it seems to your committee that it would be for the advantage of the industry if it should abandon some of the more complicated forms now in use in different cities, and more generally adopt some of the simpler forms that have been found practically successful, but without any idea of stopping progress in case any better form still shall be discovered.

Your committee holds no brief for any particular type of follow-on rate. It merely points out to the best of its ability the advantages and disadvantages of the various forms. However, if we could get down to two, or three at the most, forms of rates for residential service, it would be a distinct advantage to all concerned, and we strongly recommend consideration of the suggestion by all companies.

A change of this character can be made over a period of a few years, by the adoption of the plan of alternative or optional rate. While it is usually impossible to develop a new follow-on schedule which will show a reduction to all classes of customers with one rate change, over a period of a few years, this result can be satisfactorily accomplished.

Some of the companies fear that to change to a follow-on rate would involve a lot of trouble. Of course, nothing can be accomplished without some trouble, but the experience of companies that have changed is comparatively little and temporary in any case.

When the follow-on rate will not be an advantage to every customer, it can be put out as an optional rate, and if it is expected that most of the customers will benefit by it, they can all be changed to the new rate, provided it is made clear to them that they can change back in case it should not prove to their advantage.

The matter is largely one of psychology and of proper wording of the notices and advertisements, and so on.

Determining Principal Rate

An important point in connection with the following of alternative rates is the policy to be applied in determining which is to be considered the principal rate. That is usually determined by the statistical information secured, which would indicate under which of the two rates the majority of the customers would be benefited. It has been the experience of several companies that calling the rate that applies to the largest number of customers the principal rate, and considering the other the alternative rate, and making public a statement to the effect that the customer is to be placed on the principal rate, but that if he so desires he can be transferred to the alternative (the rate applying to the smaller number of customers), is the best policy. And that when these new rates are put into effect, which apply more favorably to the larger number of customers, it should agree with the Commission, where there is one, that all customers should be billed on this rate, and that those desiring to make a change shall indicate such desire to the utility company. Several companies have also adopted the practice, when such new rates have been put into effect, of printing on the monthly bills for a period of six months, a statement that there is another form of rate, and that if it seems beneficial the company will be glad to change the customer over to that form after examination of a year's bills. As time goes on, these rate differentials will disappear, and one rate will result.

Your committee does not consider that any attempt on the part of the company to select one or the other of the two rates for the customer would meet with any degree of success; that the changing conditions of the customer in his use of electricity from month to month make it practically impossible to pre-determine the best rate in many instances. So that your committee is emphasizing the great desirability of establishing a principal rate, and putting it up to the customer to select the other form if he deems it is more beneficial to him.

An attempt to select each month either one of two rates for a large number of customers would make an almost impossible situation and should be avoided. A full year's use of the service in one location is the only safe way to determine the *better* rate *of the two.* The differential in cents per month per customer between two such rates is so very small in many cases where the customer is on the dividing line between the two rates that very little criticism arises from the public when such a rate is put into effect, which does not affect every customer by a reduction. In the long run all customers would be benefited by the rate having the follow-on feature.

A Commission ruling on this point may be of value here. The Alabama Commission in the case of the Alabama Power Co. (P. U. R. 1929A, 458) stated as follows:

> "However, it is the opinion of the Commission that the standard rate prescribed in this order will prove of very great advantage to all customers of this utility, and we will, therefore, make the new rate applicable to all customers, unless the individual customer shall elect in writing, within a limited time, prescribed in the order, to return to the old rate."

In large cities another factor comes into the picture, and that is the tendency on the part of the customer to move.

In one large city the average number of changes in occupancy per year is about 25 per cent of the total number of residential customers. We point out that this is another reason why a principal rate should be determined upon, because there is no possible means of making comparisons between one residential customer and another, as the habits of people occupying the same premises consecutively are frequently entirely different; and furthermore, a customer moving from one premises to another sometimes changes his entire mode of living, due to adverse financial conditions or the reverse.

All of these factors make it seem very important that when two rates are in effect on residential occupancies, the principal rate be known, and that this rate be applied by the company at all times, unless the customer specifically requests a change to the alternative rate.

In numerous instances coming to the attention of the Committee, in cities where the older forms of rates have been in force for many years, the companies put into effect an alternative rate based on the floor area or room basis, which has had the effect of putting over on the new form a very large percentage of the customers in a very short time and has resulted in an appreciable increase in kw-hr. sold per customer. The advantage of having optional rates in effect is the development of a new follow-on rate system, which in time automatically eliminates the old form of rate. Confusion in bookkeeping has not been found a serious matter in the billing department, and this practice adopted by any company has been looked upon with favor by the public and the commissions.

In the case of the Hartford Electric Co., where the floor area basis of rates has been in effect for some time, the kw-hr. per annum have gradually

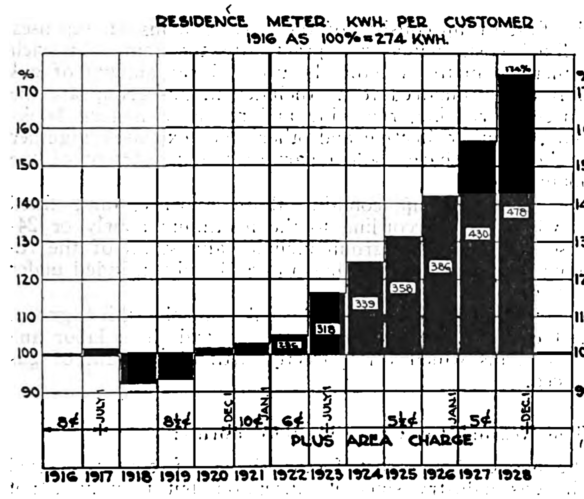

FIG. 1.

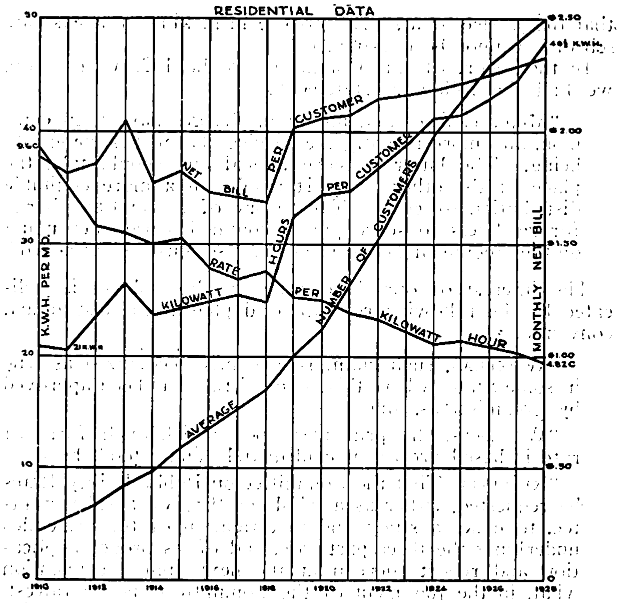

FIG. 2.

mounted year by year, until now we find the average to be 478 kw-hr. annually in 1928. Companies in the same section of the country using forms of rates without follow-on features show no increase in kw-hr. use.

The graphs shown in Fig. 1 and 2 illustrated what may be accomplished through the use of follow-on rates with reductions over a period of years, a most important indication of what can be accomplished with the proper form of rate in not only giving the customer many more kw-hr. at a decreasing rate, but also improving the company's revenue in a satisfactory manner.

Rural Residential Schedules

In most instances successful rates are based on a monthly service charge, plus a relatively low energy charge. The service charge may be entirely distinct from the charge for energy consumed, or it may include a small block of energy. The important thing is to have an energy charge that will encourage the use of electricity. The service charge itself may be based on transformer capacity, number of rooms, floor area, or any other standard. The important feature is that the service charge should be designed so as not to discourage the installation, or use, of any service that the company can profitably supply.

As an example of the way some commissions are thinking, we quote the following:

The Alabama Commission, in rendering a recent decision, said:

> "A 'promotional' rate for utilities service has been defined as a rate which successfully develops an increasing volume of profitable business. This end is attained when each customer is offered an opportunity to use additional service at a low follow-on rate for energy consumed. In order that a really low energy rate may be offered to each customer, it becomes necessary to establish a relatively high charge for an initial small block of energy to partially cover the fixed cost of service. The problem of the rate-maker centers generally around the method of assessing such initial charge to the individuals or groups of customers."

NATIONAL ASSOCIATION OF RAILROAD AND UTILITIES COMMISSIONERS

Report of Committee on Public Utility Rates 1927

The following quotation from the "Report of Committee on Public Utility Rates" of the National Association of Railroad and Utilities Commissioners gives an idea of the way other commissions are thinking on this subject. While the subject matter refers to gas rates, the same arguments might well apply to electricity rates.

To the National Association of Railroad and Utilities Commissioners:

The Committee on Public Utility Rates has in past years given considerable attention to the subject of scientific rate structure. These reports have discussed the principles of cost allocation and the necessity for the application of these principles of cost allocation have been more apparent for more than twenty-five years in electric power rates, and with the greatly increased use of major electric appliances in the home, such as the range, the water heater and the refrigerator, the application of demand principles in domestic electric rate making is rapidly coming to the front.

In its report to the 35th Convention in 1923 this Committee called attention to the alarming condition of the smaller gas utilities of the country and the necessity for the application of the rate schedules for these utilities, which would more equitably distribute the cost of service. Previously Hon. Carl D. Jackson when President had stated in an address to the Association that rate schedules based primarily upon the cost of service are a necessity to permit the possibility of the increased use of gas in fields where it has not as yet been used to any large extent. In 1923 this Committee closed its report with the statement that the justice of a service charge in making up a gas rate schedule cannot be questioned.

In the report of this Committee to the 1925 Convention, we find the following statement:

> "Meter charges and minimum charges have been common, and more recently the service charge has come into being. The latter is more logical and should take the place of the other two. It results in a more equitable distribution of costs. The theory of a stand-by charge for readiness to serve plus a commodity rate depending on the amount of actual use cannot seriously be attacked."

The interest of our Association in this subject is indicated by the following resolution adopted at the last annual convention:

> "WHEREAS, such claim is evidently recognized as true in some States where this form of rate has been approved by Commissions, and
>
> "WHEREAS, the principles upon which such form of rate is based are often inadequately understood, be it
>
> "RESOLVED, That the Committee on Public Utility Rates be requested, either as a whole or through a subcommittee, to make a study and investigation of the principles underlying the three-part rate, and of its proper application and report thereon at the next annual convention what, in the judgment of the Committeee, is the fairest, most accurate and most equitable method of charges for gas service."

Investigation as to Gas Schedules

Your Committee, therefore, in accordance with your request has made an investigation of the methods of determining the forms of rates for gas.

A review of the gas rates throughout the United States and possessions, as published in the Rate List of the American Gas Association and in the Rate Sheets of the Natural Gas Association of America, reveal the existence even at this day of straight meter rates, and also show many forms of sliding scales, block rates and special rates applicable to classes of customers, varying conditions of demand, and to specific purposes of utilization.

However this may be, it seems to your Committee that constructive and statesmanlike regulation demands that the Commissions should aid in every way possible, through encouragement of reasonable and businesslike forms of rates, the full development of public utilities in their service to the people. Nothing could put State regulation on a more useful and firmer basis.

The total gross or net revenues which may be collected by any gas company under any form of rate is not an issue in this discussion, since in the last analysis the amount of such earnings is regulated by our Commissions. The question is rather with the *forms* of rates which good management will prescribe to give the maximum public service and yield no more than the proper aggregate net revenues. It is with fair, accurate and constructive forms of rates that we are here concerned.

Your Committee feels, therefore, that an investigation of the subject matter of the Association's above quoted resolution could conveniently be divided into the following questions, which method was followed by us:

A. What are the principles underlying the so-called three-part form of rate?

B. Why should there be any occasion to change the methods of charging for gas to conform to these principles?

C. How should the principles be applied?

D. What are the relative merits of the various rate forms as to fairness, accuracy and equity?

A. The Underlying Principles:

The expenses and fixed costs incident to operating a gas company may be classified into three groups:

1. Customer Costs.
2. Demand Costs.
3. Commodity Costs.

The first group consists of the various items of expenses and fixed costs which are practically the same for each customer, no matter whether he uses a large amount of gas or only a few hundred feet. Included in this group are the expenses of reading, removing and repairing meters, bookkeeping, billing, collecting and other office expenses, together with the fixed charges on a part of the investment of the company.

The second group contains those expenses and fixed costs which vary according to the maximum hourly or 24-hr. use of gas. This group includes almost all of the remaining fixed costs, other than those already included under customer costs.

The commodity costs, which make up the third group, consist of coal, oil and other supplies, and those labor and expense items which vary directly with the amount of gas produced.

B. The Reasons for Changing Rate Forms:

The above shown cost factors have, of course, existed in the gas industry since its inception, but they have not been given general recognition in the making of rates for several reasons:

(1) As long as the major part of the gas supply was used for lighting, the use of gas was about the same for all classes of customers, and a close adherence to cost analyses was not necessary.

(2) Changes in rate forms are generally viewed with suspicion by the public. Conservative gas companies hesitated to stir up trouble as long as they could make a fairly adequate return on the old basis.

With a straight meter rate of so much per 1000 cu. ft., about one-third of the customers of a gas company are served at a loss, in that they fail to pay the bare operating expenses chargeable against them, without consideration of any return on the investment. For instance, on a rate of $1.50 per 1000 cu. ft. a customer who uses only 500 cu. ft. in a month will pay 75 cents. The customer cost to serve this customer will be more than $1.00 per month, the minimum demand cost 20 or 30 cents. This makes a total of more than $1.70, with which the customer should be charged if he is to pay a full fair return upon the investment necessary to serve him. He, therefore, lacks more than $1.00 per month of paying his way, which dollar or more must be made up by some other customer if the company is to make a fair return.

There is another approximate one-third of the customers who, while paying the operating costs necessary to serve them, do not pay a full fair return. The remaining third of the customers not only pay all of their own costs, but if the company is receiving a fair return, this group must also pay all of the losses incident to serving the other two-thirds of the customers. For example, in a recent case an official of a large company testified that one group of his customers not only paid their own way, including a full fair return, but contributed $3,000,000 a year in order to make up the deficits caused by other customers.

By reason of their rate structures, many companies get the bulk of their net earnings from their most competitive classes of service. This is an unsound condition, and it naturally hampers the growth of the industry.

C. The Application of the Principles:

The three-part principles can be expressed outright as shown in the following example:

(1)	A customer charge per meter, per month.... Plus	$1.00
(2)	A demand charge per cubic foot of maximum hourly demand, per month .... Plus	.02
(3)	A commodity charge per 1000 cu. ft. of gas sold	.60

The rate can be simplified by grouping the first two charges as per the following:

(1) A fixed charge	
For the first 25 cu. ft. or less of maximum hourly demand, per month	1.50
For all additional demand, per cu. ft. of gas sold	.60
Plus	
(2) A commodity charge per 1000 cu. ft. of gas sold	.60

The form in which the rate is expressed will depend to a large extent upon the nature of the business to be served. If the rate is to be used as an optional schedule, available only to certain classes of service, the three parts may be expressed outright or the first two grouped together, as shown above, without encountering difficulties, since the rate is to be made applicable to all customers, consideration must be given to the choosing of the method which is least expensive. The measurement of the demand of a customer, either by a demand meter or by use of a demand limiting device, is an expensive procedure, and so should not be used until absolutely necessary. In selling natural gas, where the early morning peak on an extremely cold day plays such an active part in the rendering of service, some such means may be necessary, but for most manufactured gas companies it should prove less expensive to estimate the demand of at least the bulk of the domestic users. The results arrived at may be accurate enough for all practical purposes.

In estimating the demand, some companies rate all domestic customers at the same figure and make more exact calculation for only the large industrial customers. Others rate customers according to the size of meter required. Ratings according to number of rooms and the floor area of the house have also been considered.

The principles of the three-part rate need not necessarily be stated in three parts. They are often put in force without any fixed charge, by using a high variable charge for the first few hundred feet. However, if this simplification process were carried to the extreme of distributing customer costs and demand costs at so much per 1000 cu. ft. of gas sold, the results will in all probability no longer accord with sound allocation of the actualities of the costs.

D. A Comparison of Rate Forms

A useful method of judging the merits of various rate forms is to set up several rates, each of which, when applied to the sales of a sample company, will yield the same gross revenue.

Suppose we assume a company with average sales of 2500 cu. ft. per month and a straight meter rate of $1.40 per 1000. The monthly revenue per customer would, therefore, be $3.50.

A block rate, to yield the same money, would require a slightly greater charge per thousand for the first block, and we would, therefore, have something along the following lines:

RATE No. 2

For the first 5000 cu. ft. per month, per 1000 cu. ft.	$1.45
For the next 5000 cu. ft., per 1000 cu. ft.	1.25
For all over 10,000 cu. ft., per 1000 cu. ft.	1.00

If the blocks are made shorter, the initial price will necessarily have to be larger, unless the company is willing to make a decrease in revenue in order to encourage sales. These comparisons being based on equal revenue, we would require something along the following lines:

RATE No. 3

For the first 3000 cu. ft. used per month, per 1000.	$1.50
For all additional gas, per 1000 cu. ft.	1.10

If a service charge is used of, say, $1.00 per month, the commodity charge could be lowered to $1.00 per 1000 for all customers, the rate and revenue being as follows:

RATE No. 4

(1) Service charge per meter per month	$1.00
Plus	
(2) Commodity charge per 1000 cu. ft. of gas	1.00

Revenue on this:

2500 cu. ft. at $1.00	$2.50
Service charge, per meter per month	1.00
Total	$3.50

The rate could also be put in a more popular form by quoting it as follows:

RATE No. 4 (Optional Form)

For the first 200 cu. ft. or less of gas used each month	$1.20
For all additional gas, per 100 cu. ft.	.10

The revenue on this basis would be:

200 cu. ft. at $1.20	$1.20
2,300 cu. ft. at .10	2.30
Total	$3.50

To calculate a three-part rate, we must first choose a method of measuring the demand. In the following rate, the room basis is used merely as an example, without any intention of recommending this basis for adoption by any commission or company. It is merely an illustration.

RATE No. 5

(1) Customer charge per meter, per month	$0.95
Plus	
(2) Demand charge per active room, per month (with a minimum of three active rooms)	.10
Plus	
(3) Commodity charge per 1000 cu. ft. of gas	.80

Assuming an average of 5½ rooms per customer, this rate would yield the following revenue on present sales:

Customer charge	$.95
Demand charge, 5½ rooms at 10 cents	.55
2500 cu. ft. at 80 cents	2.00
Total	$3.50

If the number of rooms is more or less than 5½, the above charge will require slight changes. This rate can also be quoted in the following form, eliminating the complexity:

For customers with 3 or less active rooms, for the first 200 cu. ft. or less of gas used each month	$1.41
For all additional gas, per 100 cu. ft.	.09

For customers with more than 3 active rooms, the above charge of $1.41 for the first 200 cu. ft. shall be increased 10 cents for each additional room.

Having thus calculated the rates, it may next be in order to compare them, and an easy method is to show the bills of representative customers on each, as follows:

Gas Bill on Various Rates

Gas Used	No. 1 Meter Rate	No. 2 Block Rate	No. 3 Block Rate	No. 4 Service Charge	No. 5 3 Rooms	Three-Part Rate 3 Rooms	Three-Part Rate 8 Rooms
10,000	$14.00	$13.50	$12.20	$11.00	$9.25	$9.45	$9.75
9,000	12.60	12.25	11.10	10.00	8.45	8.65	8.95
8,000	11.20	11.00	10.00	9.00	7.65	7.85	8.15
7,000	9.80	9.75	8.90	8.00	6.85	7.05	7.35
6,000	8.40	8.50	7.80	7.00	6.05	6.25	6.55
5,000	7.00	7.25	6.70	6.00	5.25	5.45	5.75
4,000	5.60	5.80	5.60	5.00	4.45	4.65	4.95
3,500	4.90	5.07	5.05	4.50	4.05	4.25	4.55
3,000	4.20	4.35	4.50	4.00	3.65	3.85	4.15
2,500	3.50	3.62	3.75	3.50	3.25	3.45	3.75
2,000	2.80	2.90	3.00	3.00	2.85	3.05	3.35
1,500	2.10	2.17	2.25	2.50	2.45	2.65	2.95
1,000	1.40	1.45	1.50	2.00	2.05	2.25	2.55
500	.70	.72	.75	1.50	1.65	1.85	2.15
0	0	0	0	1.00	1.25	1.45	1.75

Three Part Rate Fairest

Except for one consideration (that it tends to increase the bills of all casual and irregular or "convenience" customers), the three-part rate shown in the last three columns of the above table immediately becomes apparent as the fairest, most accurate and most equitable of the rates shown. It comes closest to charging each customer with the cost of serving him. It appears to be as accurate as is possible without the expense of additional meters to actually measure or limit the demand.

Technically speaking, gas rates should be judged only by the standards of fairness, equity and sound business judgment. However, in order to cultivate that valuable asset of public utilities, namely, good public relations, it is necessary to consider rates from that angle also. When the rates in the above table are so viewed, the decision is again in favor of the three-part rate. It will be noted that winter and summer bills will be equalized, thus minimizing the danger from that prolific source of complaints, high bills. It will also be noted that 80-cent gas is offered to every customer, thus permitting the substitution of a clean convenient fuel at a reasonable cost in the homes of the workingmen as well as in those of the well-to-do citizens. The initial charge is not excessive for any customer, and it is quoted in language easily understood by that customer. Although appearing somewhat complicated on paper, it can be easily explained to the customer, since for each customer, it consists of a meter rate of 80 cents per 1000, with a definite fixed charge or charge for the first 200 cu. ft. It is easy to see that the three-part rate will tend more than any of the others to encourage the use of gas, develop the industry and result in future economies and lower unit prices.

There remains for comment the first point mentioned above the increases to the small customers, as a talking point against the installation of rates embodying the three-cost principles. The small customer is often referred to as the poor man. Such is not commonly the case. It should not require any detailed examination or calculation to convince anyone that the workingman or clerk, whose wife cooks meals for the good sized family, whose laundry is done at home, and who cannot afford to eat out at restaurants, is naturally a larger user of gas than the well-to-do man who lives in a high priced apartment, where heat and hot water are furnished by the landlord, where few meals are cooked and where there is little use for gas, except as an occasional convenience. Technically speaking, we should not take into consideration the financial condition of the customers in determining gas rates and charges. However, even if this is done, we are forced to conclude that there is no reason why the small convenience user should not be asked to pay his own way, rather than remain a burden upon the customer who really uses gas service. The three-part rate can well be stated as the best rate for the poor man.

Any change in conditions to which people are accustomed causes opposition. Examples of this occur daily. For instance, violent opposition is offered in some cities to the installation of water meters, customers preferring the flat rate. This is the direct opposite of conditions in the gas industry, where companies are endeavoring to change from meter rates to something approximating a flat rate. A number of gas companies have had unfortunate experience with the installation of service charges, but this we believe was due to the installation of these charges as increases in rates, without enough of a reduction in the accompanying meter rate to demonstrate to the customers the benefits of the rate form.

The installation of proper rate forms for selling gas is a matter which will require extensive educational efforts on the part of the gas companies. They may best install new rate forms either to yield the same revenues they are now getting, or in connection with a decrease in their present revenue. If the lack of sales of any gas company is due to the rate form, the company may not advisably, in our judgment and experience, attempt to install a change in form at the same time, as it increases its average rate. It might well try first a change in form of rate and determine if this will not bring about the necessary improvement in financial results.

Your Committee, while not recommending to regulatory commissions or to gas companies any rigid uniformity or standardized method of rates and charges for gas, which should remain a matter for the best business judgment in each individual case in accordance with the local situation, does, however, heartily approve methods of charges for gas based on allocation of costs of service, so as to permit the gas industry of the country to develop its maximum possibilities in more extensive and more economical service to the public.

Respectfully submitted,

A. G. PATTERSON, *Chairman,*

Committee of Public Utility Rates of the
National Association of Railroad and
Utility Commissioners.

It will be noted that the last two paragraphs of the Commissioners' report says that the charges for gas should be based on allocation of costs of service so as to permit the gas industry to develop its maximum possibilities in more extensive and more economical service to the public.

The report points out that after the rate expert has allocated costs by one method and arrived at a set of rates, the rate expert should try another method of allocation of costs, and if the second method will result in more extensive and more economical service to the public, the second method of allocation of costs is better than the first method.

SUGGESTION SYSTEMS

Preface

Upon noting a subject such as suggestion systems on the list of those discussed by an Accident Prevention Committee, the first thought is to feel that such lies rather outside of its immediate scope. Further inquiry, however, among those who have to do with a suggestion system will develop the fact that there is no medium better than it to bring accident hazards to light, as well as valuable items along many other lines.

Moreover, no channel has yet been devised equal to it for obtaining the opinions of a large group of employees, and obtaining their accumulated experience which is far better than an equal amount of theorizing.

Introduction

A suggestion system is an orderly method for encouraging, receiving and rewarding helpful ideas of employees relative to the business of the employing firms or corporations.

That it is effective in producing the results desired is attested by the fact that several universities among them the University of Pennsylvania and the University of Michigan, offering courses in business administration and financial training, have made intensive studies of this phase of business. One university in a recent report states:

> "The number of American and British concerns having definite systems appears to include more than 300 companies employing more than a million workers."

Insurance companies also, through their service bureaus, have issued pamphlets commending the advantages of a suggestion system.

In the United States the first system apparently was introduced in 1888. In July, 1912, the United States Congress passed an Act providing that employees of the Ordnance Department not specifically charged with originating improvement and efficiency be suitably rewarded by cash payment for efforts resulting in improvements. Similar arrangements were introduced in the Post Office Department in 1913-1914, and again in 1924. The latest addition to the list of large corporations adopting such a plan is the Pennsylvania Railroad Company, as announced in December, 1927.

Other firms are displaying interest by making frequent requests for data from those who have successful systems in operation.

The reports of studies made by the two universities mentioned include certain statistics as shown in Tables I, II, III and IV.

General

The successful operation of a suggestion system depends primarily on the management and the supervisory staff being sympathetic; if not, it is a mere waste of time to install a system.

Of almost equal importance are the methods of

handling, for in a large concern highly organized, systematic procedure must be followed in order that proper consideration may be given each idea offered. Promptness and despatch are also essential and have much to do with keeping up interest and giving assurance that all ideas will be treated with the same facility and judgment given to other items of business.

With employees numbering thousands a relatively large volume of suggestions is certain to ensue, but these will come usually from 10 to 15 per cent of the force and about 25 to 30 per cent will be adopted. The figures, however, apply more to a large concern than to a small one and there will be exceptions where the percentage of employees participating and the volume of suggestions submitted and adopted will be very much greater.

Aside from the obvious purposes of a suggestion system there will be provided an additional point of contact between employer and employee, a feature which should appeal more particularly to the larger concerns. This will enable matters of all kinds to reach the management, and also permit the management to express itself to the employees, even individually.

Still another feature which should not be overlooked is that certain items can be handled by a suggestion system which can hardly be covered or provided for by any other channel, among these being matters pertaining to apparatus, such as quality and cost, or to factory and office-conditions as health and prevention of accident, or to miscellaneous items such as systems and methods, etc.

All systems include either a representative delegated by the management, or a committee consisting of management and employees appointed to handle the details of recording, investigating, answering and rewarding. The forms in vogue vary widely, but the most satisfactory seems to be that in which the committee acts as "attorney" for the suggestor, presenting his "case" to the proper "court" or branch of the organization most concerned. General knowledge of plant, policy, personnel and product is thus required of the committee in order that subjects may be referred to proper authorities for verdicts. The committee thus becomes the medium in transmitting proposals to the management and their verdicts to the suggestors. This method of procedure seems to be especially suited to large organizations, a better plan than for the suggestion committee itself to attempt to pass upon the merits of any suggestions.

After studying systems in operation in various concerns it is felt that the matter of eligibility and restrictions should not be overemphasized, though recognition must be given to these factors and perhaps certain employees excluded from participation. The majority of concerns favor cash awards for every suggestion, although some only pay for the very best and give honorable mention to others, some offer merit certificates while still others offer gift articles.

In the majority of instances it will not be possible to figure savings effected by the adoption of a suggestion; but, where it can be done the amount of the award should be a given percentage of the saving of a certain period, say one or two years. For the reason, however, that generally no clean-cut estimate of savings can be made, it is customary to consider awards simply as prizes, though some plan even here must be followed of which several are outlined in the appendix.

Of the suggestions submitted, it should not be expected that more than 25 to 30 per cent can be adopted, but, in order to maintain and increase interest in a system, an additional award may be offered. For example, when five suggestions have been accepted and paid for, an additional award of $5 may be made; when a total of ten suggestions have been accepted an additional award of $10 may be made and so on.

Suggestions involving patents usually require a long time before awards can be made. A quick way to handle these, however, is to decide on a minimum award of $25 in every instance where a patent seems to be worth trying for. If ultimately a patent is obtained and the claims allowed warrant, an additional award can then be made.

Details of a Suggestion System

Notices should be posted throughout the various departments of a plant outlining the system. Suggestion blanks on which statements may be written should also be available. These may either be deposited in special boxes, or dropped in the shop mail.

The advantages of the system may be held before employees by the posting of card "reminders" varying in style and form, and changed at regular intervals.

A revolving committee of not less than three persons to serve for a year should be appointed by the management with a permanent chairman and a secretary. Two of these members may be selected from the supervisory staff and one from among the hourly paid workers. The chairman and the secretary can handle all the routine work, somewhat as follows:

1. Suggestions, submitted on suggestion blanks or even on ordinary paper, are sent by mail to the committee.
2. Subjects are assigned, suggestions acknowledged on printed form, carbon copies of the form used are filed, both by subject and by name of employee.
3. Suggestions by typewritten letter are sent to the department or person most competent to answer, soliciting an opinion of the idea offered. Occasionally personal interviews are arranged.
4. When the reply is favorable (i.e., suggestions acceptable), the suggestion is listed with others accepted and all are evaluated by the secretary.

   When the reply is unfavorable, a copy of the opinion is forwarded to suggestor.
5. The chairman calls the committee into conference to discuss the list further, including awards; the approved list is signed by each member and forwarded to the manager of works or another officer, for final approval.
6. Notifications of acceptance and award are forwarded to suggestors.
7. Checks are delivered by the secretary or mailed to the suggestors who sign receipt cards. Cards serve as a record of the individual whose suggestions are adopted.
8. Prominent mention is given in the monthly plant paper to the "Best Suggestions."

Conclusion

The subcommittee has only aimed to present a condensed report, as observation and long experience with the operation of suggestion systems indicate their success rests upon simple, commonplace foundations, namely desire for improvement, good faith and sincerity of purpose. As the system becomes better understood by all, it furnishes a very distinct and effective agency for the collection of ideas, otherwise lost.

Acknowledgment is made herewith to the institutions quoted above, to the authors and publishers named in the appended bibliography, as well as to the members of our Accident Prevention Committee who have contributed details of their systems.

OPERATING COMPANIES' STATEMENTS

THE EDISON ELECTRIC ILLUMINATING COMPANY OF BOSTON

Subcommittee Report on One-Dollar Awards

This Committee has considered the various phases of the question of making a cash award of one dollar to employees calling attention to hazards to persons, property or service. The records of the Accident Prevention Committee since the inception of the one-dollar-award idea, and the correspondence between the Committee and the various Bureau and Department heads, have been reviewed. The Committee also has obtained the views of the most interested Department heads. With this information, together with Committee members' experience on the Committee as a background, the following recommendations are submitted:

1. It is believed there is merit in the idea of a cash award for suggestions because of the incentive which an award holds for most individuals. It is recommended that the practice be continued in a somewhat modified form of procedure and under slightly more restricted rules.

   It is realized that it might be argued that an employee should report all such conditions observed because of his sense of loyalty to the company. However, it is a psychological fact that human beings old and young require some motivation for the accomplishment of good works. A small cash incentive will cause the average employee to see more and report more than if such incentive were lacking.

   It seems to the Committee that the one-dollar award is a reasonable and economical means of accomplishing a desirable objective.

   The question of allowing awards by conducting a competition has been considered; that is, each month making an award to the two or three employees turning in the largest number of approved suggestions. It is realized, however, that while this might reduce the total amount of money spent for suggestions, it would automatically disbar the person who might make one suggestion per year which would be more valuable to the company than all of the suggestions of the prize winners. Therefore, this idea has been rejected.

2. The following specific procedure is recommended. It is believed that in most cases it conforms with present procedure, but as present procedure has never been made a matter of record, it seems that it is well to make the record now.

   (a) Suggestions shall be made in duplicate by the individual and submitted through his Division head to the Clerk of the Accident Prevention Committee.

   (b) The Clerk of the Committee should retain the copy of the suggestion and forward the original to the Department head having jurisdiction over the condition referred to. The Department head after investigation shall either approve or disapprove the suggestions giving reasons, and forward it to the head of the Department from which the suggestion emanated.

   (c) The head of the Department in which the suggestion originated may make any comments he may wish, approve or disapprove, and return to the Clerk of the Accident Prevention Committee.

Referred to Mr. .... for approval of $1 Award - Do you approve? ....

If not approved, why?.......... Signed..........

FIG. 1—SAFETY SUGGESTION FORM—EDISON ELECTRIC ILLUMINATING COMPANY OF BOSTON.

(d) Those suggestions which have been approved by both Department heads will be approved by the Accident Prevention Committee for the award. Those suggestions which have been disallowed by Department heads will be reviewed by the Accident Prevention Committee. If in the opinion of the Committee there is a question as to the merits of the suggestion from accident viewpoint, they may resubmit it to the Department heads having jurisdiction for further investigation and report.

(e) All suggestions will be acknowledged either by the award of one dollar or by a memorandum advising that the award has been disallowed, thanking the employee, and requesting his continued interest in submitting suggestions.

3. There are, of course, a great variety of suggestions, and it is impossible to define them all. However, experience has shown that a majority of awards in the past have been made on suggestions covering a few types of conditions, and the following definitions will apply to most cases which arise.

(a) Suggestions calling attention to undesirable conditions on or near primary wires, such as radio antennae crossings, broken insulators, wires off insulators, wires chafing in trees without protection, wires in proximity to houses or where they may be reached by persons, crossings with other circuits, etc., are well worth while and should be rewarded.

(b) Suggestions calling attention to secondary wires need more careful scrutiny. In general, broken or detached house irons are a potential hazard and suggestions calling attention to such cases should be rewarded. Twisted service wires may or may not constitute a hazard and the question of the award must be left to the judgment of the Department head. Contact with trees, chipped insulators, wires or pins, etc., are not generally a hazard and should not be awarded.

(c) The fact that a condition that has been called to the attention of a department is corrected, does not necessarily entitle the suggestor to the one-dollar award. It is recognized that a condition which is not in any way hazardous might be corrected because of the presence of a crew of men at the scene for investigation. No appreciable expense would be involved, the expense having been incurred in going to the location.

(d) The miscellaneous suggestions which may be sent in not covered in the above, must be dealt with individually and treated justly according to their merits.

(e) Those who are eligible to receive the one-dollar award shall be all persons who are employees of the Edison company below the rank of the assistant division heads, except the members of the Accident Prevention Committee of the company.

BROOKLYN EDISON COMPANY

General Instructions to Safety Subcommittee Members

Safety subcommittee members are appointed for a period of four weeks by the supervisors of their respective bureaus. While serving in this capacity they are expected to cooperate with the Safety Engineering Bureau in an endeavor to prevent accidents to employees through the elimination of hazardous conditions and unsafe methods of conducting work.

One day per week is to be devoted to this work. It is called to the attention of the subcommittee members that this time is charged to the account of the Safety Engineering Bureau and that this time will be profitably spent only if their duties are discharged in an intelligent and conscientious manner.

On the day assigned for inspection, the subcommittee members will meet for a short conference with a representative of the Safety Engineering Bureau and with their Bureau head or a representative of their Bureau, who will offer such special instructions and assignments as he deems advisable and necessary. The remainder of the day will be devoted to an inspection of the activities of their Bureau employees and the physical property of their Bureau.

As a general guide to the intelligent discharge of their duties the following activities are suggested to the subcommittee members:

1. Inspection of the physical properties of their Bureau. Where this applies only to offices, particular attention should be given to all office equipment, noting any defects in desks, chairs, cabinets, inkwells, etc.
2. Inspection of the physical property of the Bureau in the field both mobile and stationary, for defects and hazardous conditions.
3. Inspection of tools and equipment used by the Bureau employees. This is very important because many accidents are caused by defective tools and the lack of necessary tools and equipment.
4. Particular attention should be paid to the manner of conducting work on the part of the Bureau employees. Accidents are certain to result when safety precautions are not observed. The subcommittee members should be familiar with the safety rules in order that they may correct their abuse or infraction in the field.
5. The safety subcommittee should secure safety suggestions from their fellow workers in the Bureau. These safety suggestions play an important part in the prevention of accidents and in creating safer working conditions for the employees. The men in the field should therefore submit suggestions to the subcommittee members freely. The number of suggestions submitted constitutes a very good indication of the zeal of the members of the subcommittee in the discharge of their duties.
6. A report of the results of the day's activities and the safety suggestions submitted should be made out on forms provided for that purpose by the Safety Engineering Bureau.
7. The subcommittee is charged with the classification of accident reports for their Bureau. This duty should be performed in a conscientious manner in order to avoid injustice to the injured employee by a wrong classification. These classifications should be settled upon only after a personal consultation with the injured employee. The purpose of this classification of accidents is two-fold. First, to get more details concerning the facts of the accident and the circumstances surrounding it at the time, and secondly, to obtain the opinion of fellow employees working in the same lines of work concerning the cause of the accident for the benefit of the Safety Engineering Bureau and the company. It should be recognized by the subcommittee members that in applying this code to the accident reports it becomes apparent that accidents do not happen, they are caused. Every accident is an indication of inefficiency either on the part of the injured employee, his fellow employee or in the manner of conducting the work in the process of which the accident occurred.

Special Work Assignments to Subcommittees

These special work assignments are to be agreed upon jointly by the Bureau supervisor and representative of the Safety Engineering Bureau for the purpose of attending to particular situations which may exist in the field. Particular attention should be given to these by the subcommittee members as they may be most productive of good for the employees themselves.

Educational Aspects of Safety Committee Work

The purpose of these subcommittees and especially the rotation of subcommittee members is also to educate the individual employees to a realization of the importance and necessity for intelligent effort to prevent accidents.

ANNOUNCEMENT

SUGGESTION PLAN

PRODUCTION, TRANSMISSION & CONSTRUCTION DEPARTMENTS

The Suggestion Plan is hereby established and will go into effect June 15th. 1926. The purposes of the Suggestion Plan are as follows:

1. To encourage employes to study and give special attention to the various phases of the Company's business, and to secure ideas and suggestions which would be of benefit to the Company.

2. To provide adequate means for consideration of all suggestions received and to make awards in proportion to their value for suggestions which can be adopted.

A Suggestion Committee is hereby appointed with the following members: Messrs. H. J. Burton, Chairman; G. F. Stecker, F. G. Boyce, and J. G. Hemstreet.

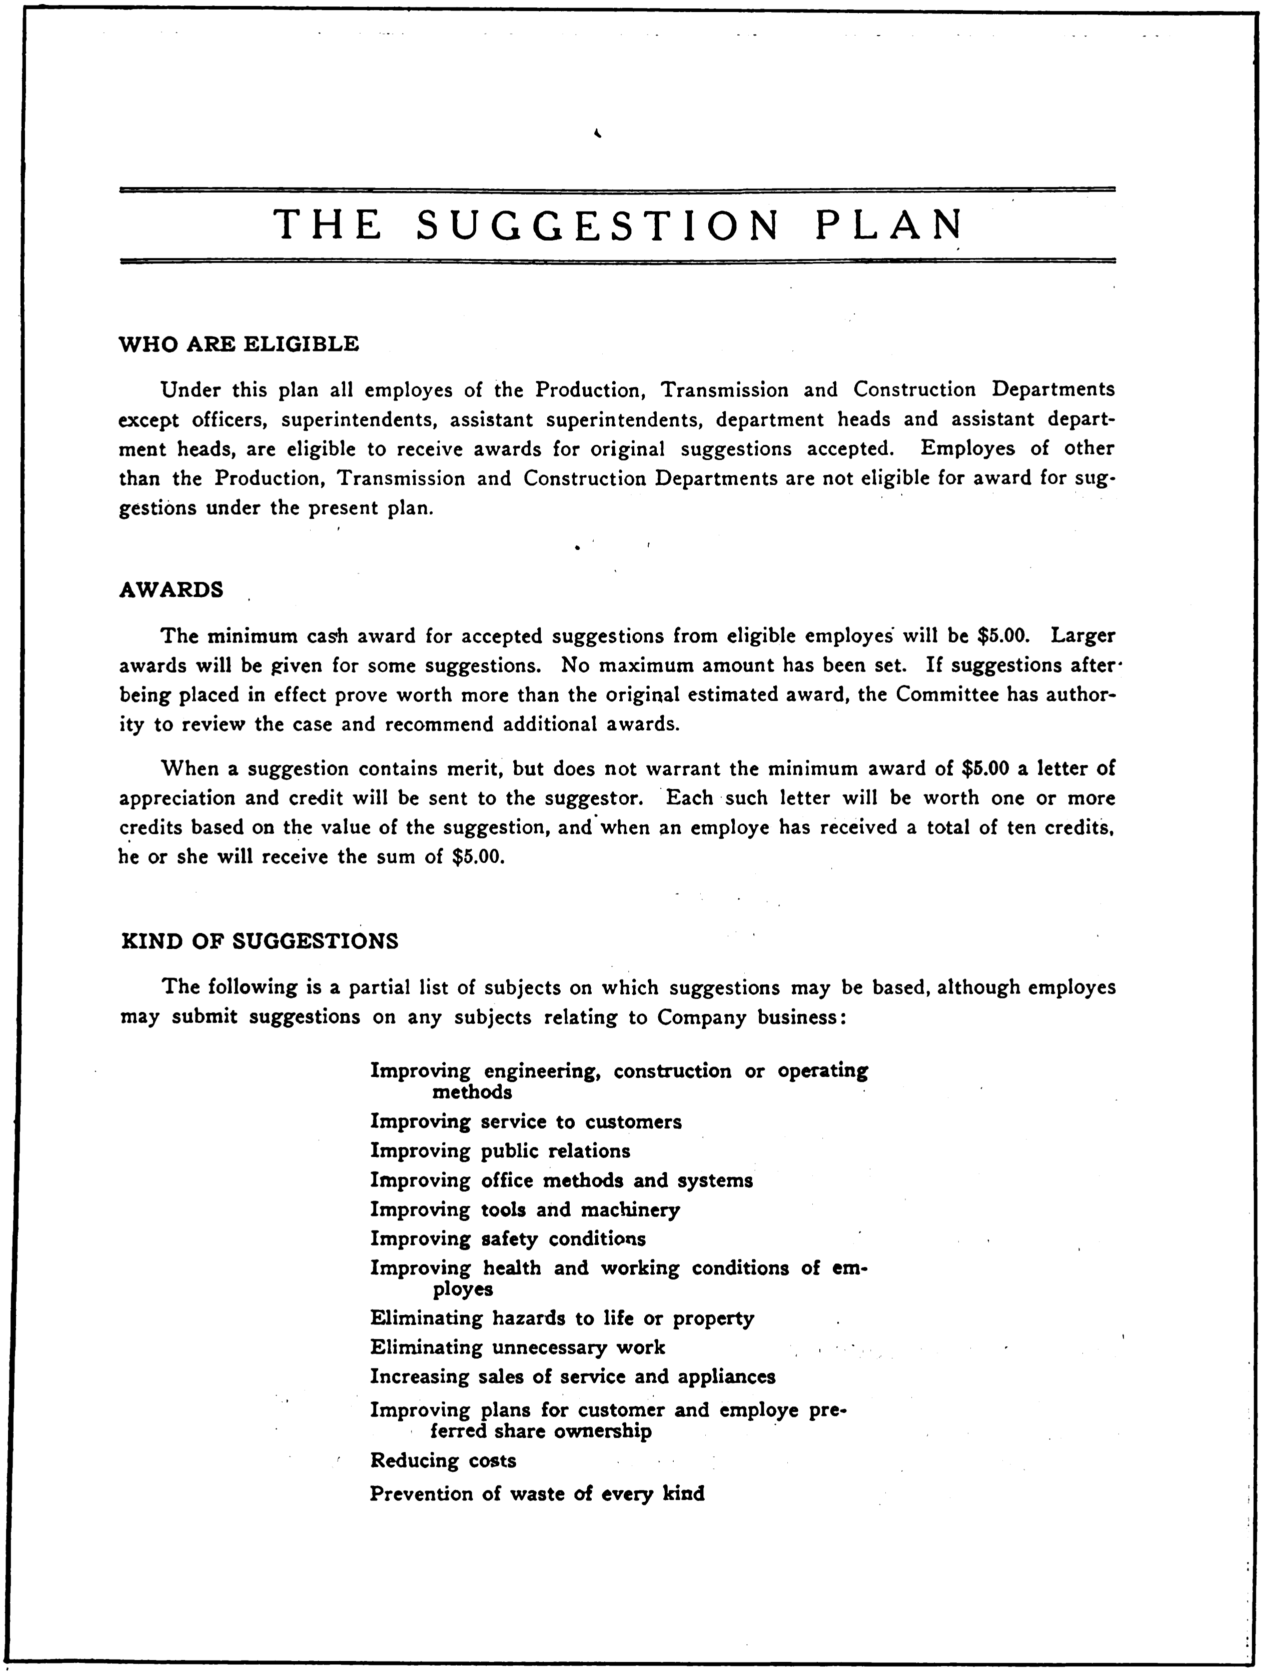
The Suggestion Committee shall be responsible for the operation of the Plan and all communications regarding it should be addressed to the Committee or its Chairman.

Very truly yours,

Manager
Production, Transmission and Construction
Departments

Address all communications regarding the Plan to Suggestion Committee, Consumers Power Company, Jackson, Michigan.

FIG. 3—PAGE 1—SUGGESTION PLAN ANNOUNCEMENT—CONSUMERS POWER COMPANY.



THE SUGGESTION PLAN

WHO ARE ELIGIBLE

Under this plan all employes of the Production, Transmission and Construction Departments except officers, superintendents, assistant superintendents, department heads and assistant department heads, are eligible to receive awards for original suggestions accepted. Employes of other than the Production, Transmission and Construction Departments are not eligible for award for suggestions under the present plan.

AWARDS

The minimum cash award for accepted suggestions from eligible employes will be $5.00. Larger awards will be given for some suggestions. No maximum amount has been set. If suggestions after being placed in effect prove worth more than the original estimated award, the Committee has authority to review the case and recommend additional awards.

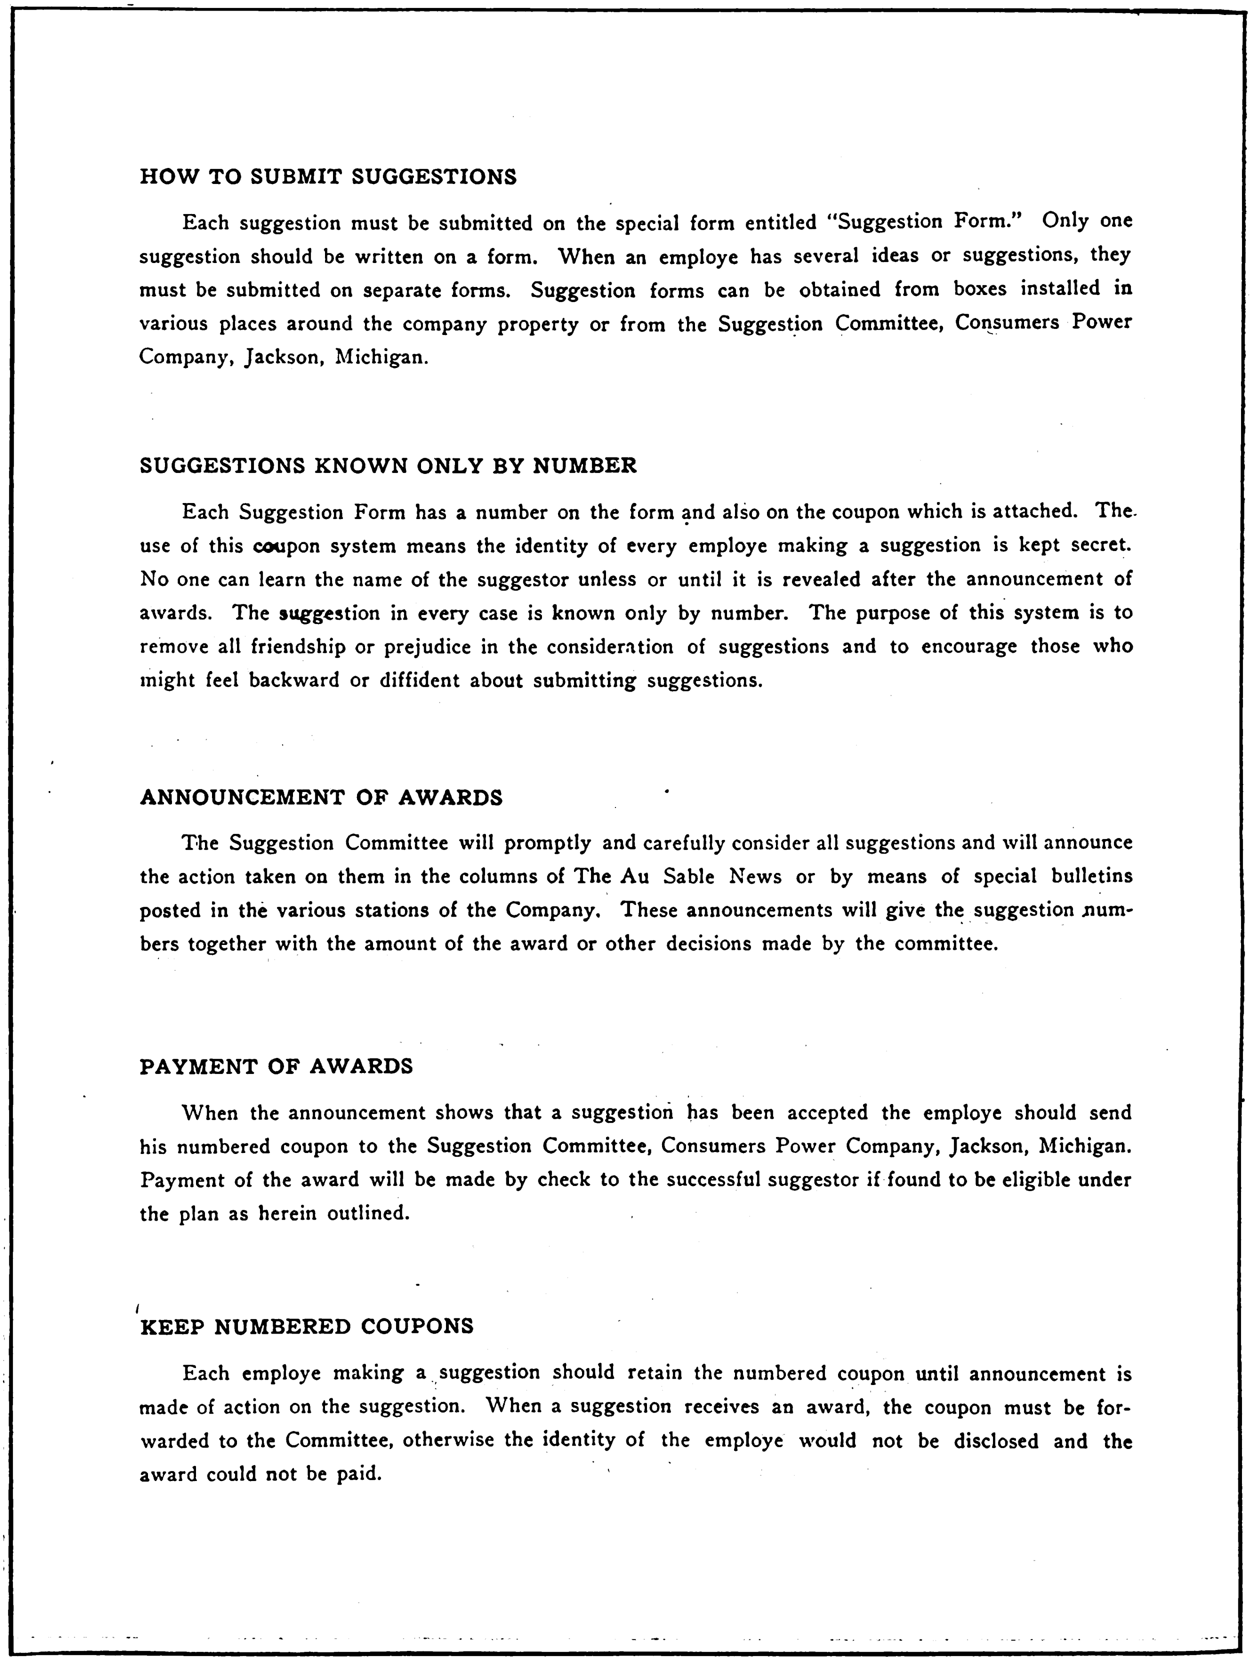
When a suggestion contains merit, but does not warrant the minimum award of $5.00 a letter of appreciation and credit will be sent to the suggestor. Each such letter will be worth one or more credits based on the value of the suggestion, and when an employe has received a total of ten credits, he or she will receive the sum of $5.00.

KIND OF SUGGESTIONS

The following is a partial list of subjects on which suggestions may be based, although employes may submit suggestions on any subjects relating to Company business:

Improving engineering, construction or operating methods
Improving service to customers
Improving public relations
Improving office methods and systems
Improving tools and machinery
Improving safety conditions
Improving health and working conditions of employes
Eliminating hazards to life or property
Eliminating unnecessary work
Increasing sales of service and appliances
Improving plans for customer and employe preferred share ownership
Reducing costs
Prevention of waste of every kind

FIG. 4—PAGE 2—SUGGESTION PLAN ANNOUNCEMENT—CONSUMERS POWER COMPANY.



HOW TO SUBMIT SUGGESTIONS

Each suggestion must be submitted on the special form entitled "Suggestion Form." Only one suggestion should be written on a form. When an employe has several ideas or suggestions, they must be submitted on separate forms. Suggestion forms can be obtained from boxes installed in various places around the company property or from the Suggestion Committee, Consumers Power Company, Jackson, Michigan.

SUGGESTIONS KNOWN ONLY BY NUMBER

Each Suggestion Form has a number on the form and also on the coupon which is attached. The use of this coupon system means the identity of every employe making a suggestion is kept secret. No one can learn the name of the suggestor unless or until it is revealed after the announcement of awards. The suggestion in every case is known only by number. The purpose of this system is to remove all friendship or prejudice in the consideration of suggestions and to encourage those who might feel backward or diffident about submitting suggestions.

ANNOUNCEMENT OF AWARDS

The Suggestion Committee will promptly and carefully consider all suggestions and will announce the action taken on them in the columns of The Au Sable News or by means of special bulletins posted in the various stations of the Company. These announcements will give the suggestion numbers together with the amount of the award or other decisions made by the committee.

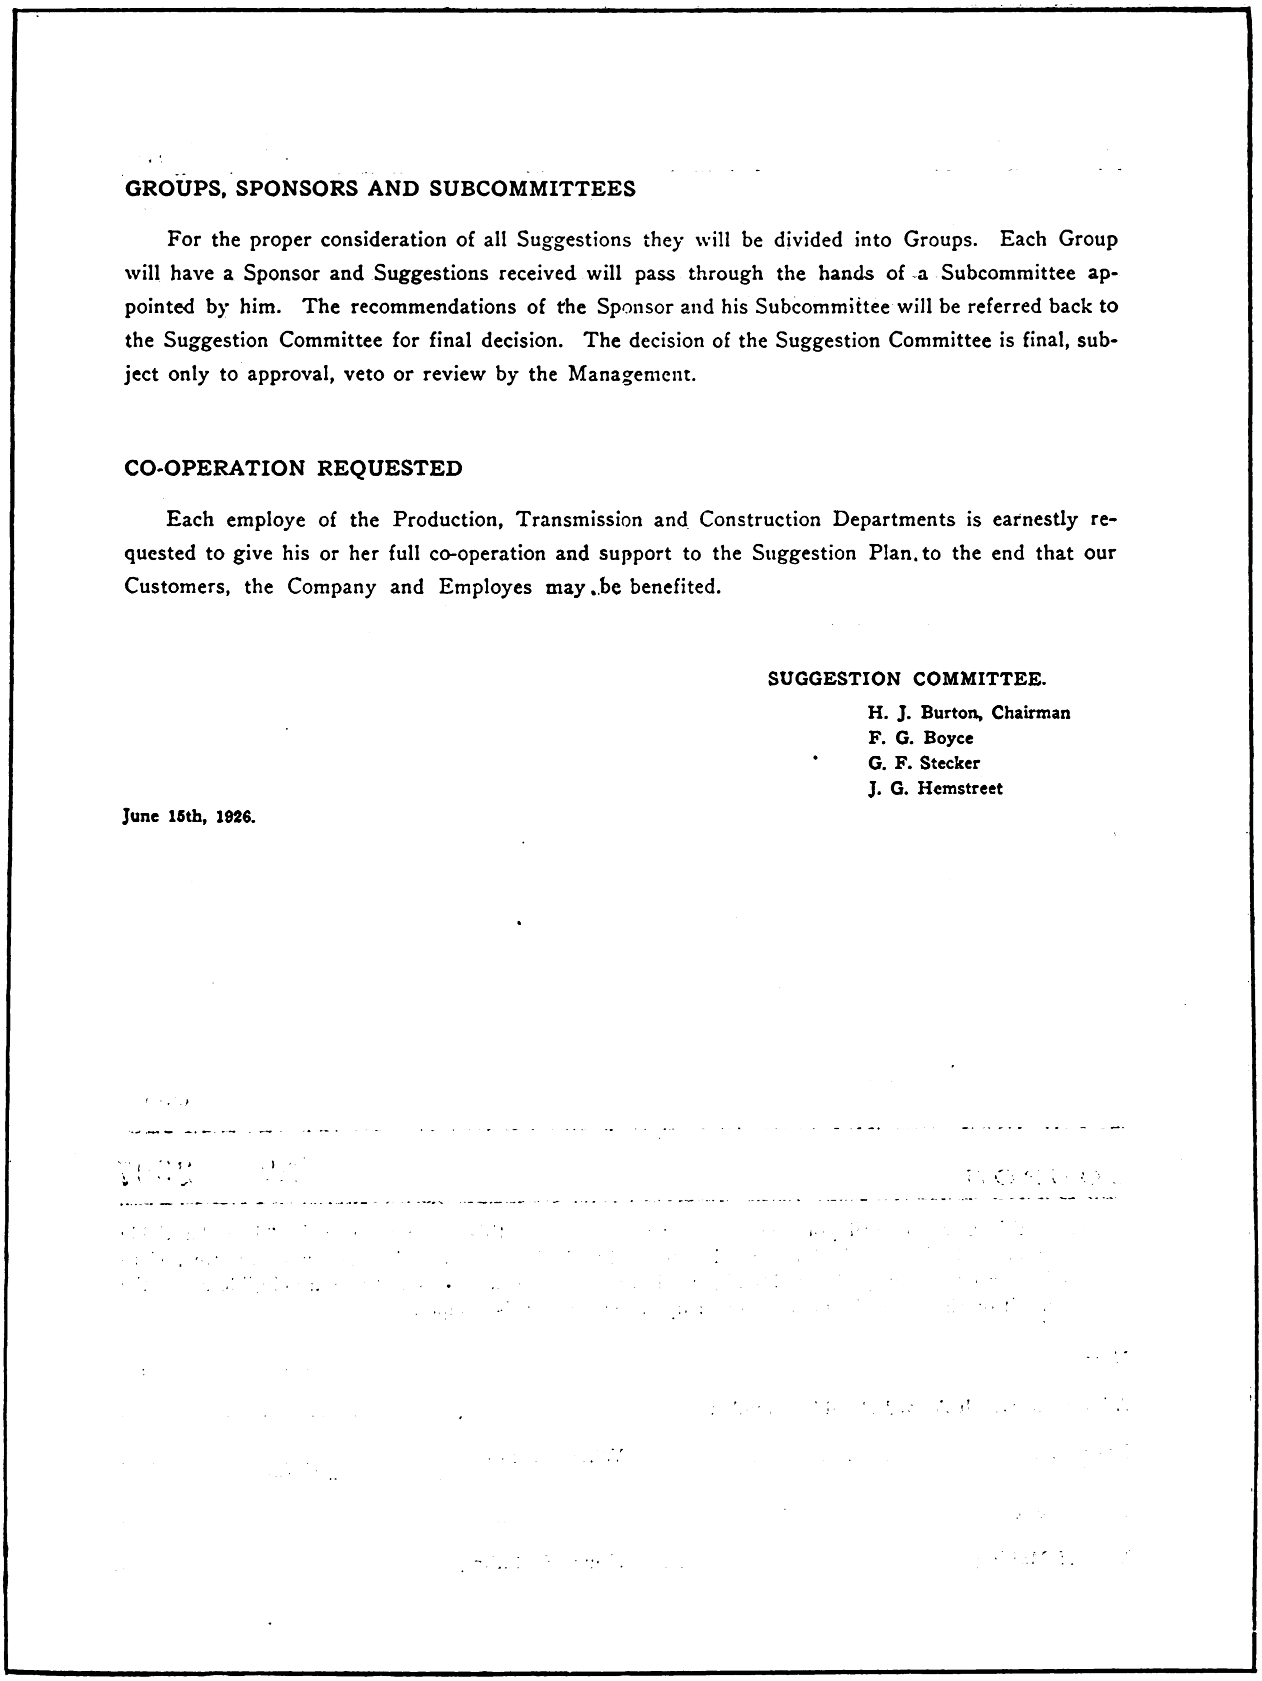
PAYMENT OF AWARDS

When the announcement shows that a suggestion has been accepted the employe should send his numbered coupon to the Suggestion Committee, Consumers Power Company, Jackson, Michigan. Payment of the award will be made by check to the successful suggestor if found to be eligible under the plan as herein outlined.

KEEP NUMBERED COUPONS

Each employe making a suggestion should retain the numbered coupon until announcement is made of action on the suggestion. When a suggestion receives an award, the coupon must be forwarded to the Committee, otherwise the identity of the employe would not be disclosed and the award could not be paid.

FIG. 5—PAGE 3—SUGGESTION PLAN ANNOUNCEMENT—CONSUMERS POWER COMPANY.



GROUPS, SPONSORS AND SUBCOMMITTEES

For the proper consideration of all Suggestions they will be divided into Groups. Each Group will have a Sponsor and Suggestions received will pass through the hands of a Subcommittee appointed by him. The recommendations of the Sponsor and his Subcommittee will be referred back to the Suggestion Committee for final decision. The decision of the Suggestion Committee is final, subject only to approval, veto or review by the Management.

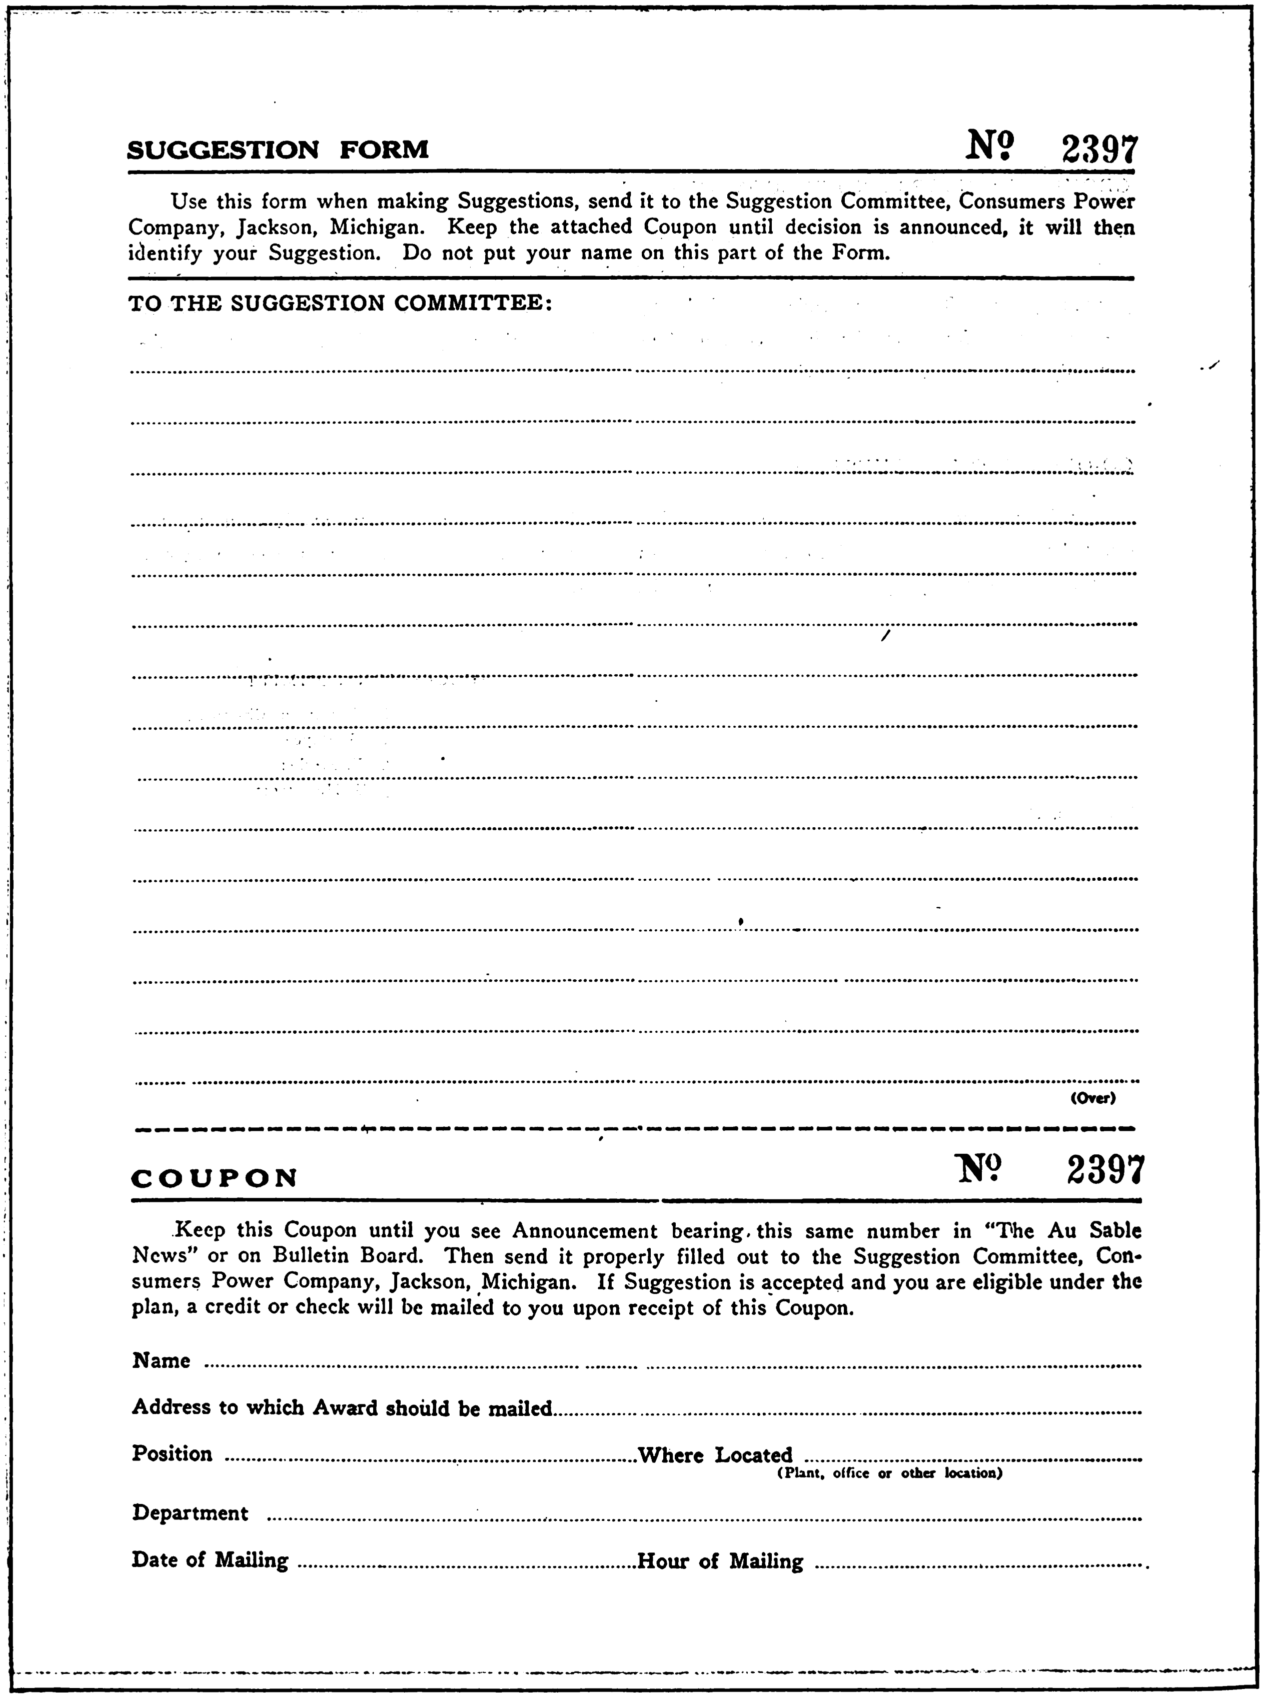
CO-OPERATION REQUESTED

Each employe of the Production, Transmission and Construction Departments is earnestly requested to give his or her full co-operation and support to the Suggestion Plan to the end that our Customers, the Company and Employes may be benefited.

SUGGESTION COMMITTEE.
H. J. Burton, Chairman
F. G. Boyce
G. F. Stecker
J. G. Hemstreet

June 15th, 1926.

FIG. 6—PAGE 4—SUGGESTION PLAN ANNOUNCEMENT—CONSUMERS POWER COMPANY.



SUGGESTION FORM **Nº 2397**

Use this form when making Suggestions, send it to the Suggestion Committee, Consumers Power Company, Jackson, Michigan. Keep the attached Coupon until decision is announced, it will then identify your Suggestion. Do not put your name on this part of the Form.

TO THE SUGGESTION COMMITTEE:

(Over)

COUPON **Nº 2397**

Keep this Coupon until you see Announcement bearing this same number in "The Au Sable News" or on Bulletin Board. Then send it properly filled out to the Suggestion Committee, Consumers Power Company, Jackson, Michigan. If Suggestion is accepted and you are eligible under the plan, a credit or check will be mailed to you upon receipt of this Coupon.

NOTICE

Before sending in Suggestion tear off this Coupon. Fill it out in ink, giving date and hour of mailing, name, department, position and the location of your present job with the Company. Keep this Coupon and watch "The Au Sable News" and Bulletin Boards for announcement regarding your Suggestion Number. The following is a partial list of subjects on which suggestions are desired, although ideas on any subjects relating to Company business may be submitted:

Public Relations
Fire Prevention
Tools
Health
Sanitation
Cleanliness
Transportation
Selling of Preferred Shares to Employes

Prevention of Waste
Advertising
Distribution
Machines
Service to Customers
Reduction of Costs
Selling of Service

Manufacture and Operation
Handling and Storage of Materials
Accident Prevention
Elimination of Unnecessary Work
Office Methods and Systems
Selling of Appliances
Sale of Preferred Shares to Customers

For further details of plan see June, 1926 number of The Au Sable News or write to Chairman of the Committee.

FIG. 9—RECOMMENDATION FORM FOR USE BY SPONSOR AND SUBCOMMITTEE—CONSUMERS POWER COMPANY.

THE GENERAL ELECTRIC COMPANY

Suggestion System

In discussing the General Electric suggestion system it might be well to go into the history of the system somewhat, in order to give an idea of the reasons for its origination and to convey some idea of its background.

The first suggestion committee of the General Electric Company was appointed at Schenectady to take care of ideas originated by the men which formerly had gone directly to the manager or to his staff. These things went there because the men originating them were not satisfied with having anyone of less importance consider them. Taking care of this work was a burden and the manager, in order to relieve himself of this necessity, created the suggestion committee. When it first began to function it was a job assigned to various individuals who were to devote part of their time to the work. The meetings were irregular, sometimes months passing between meetings. It was looked upon by everyone as a sort of nuisance to be tolerated but not encouraged. A great deal of dissatisfaction was caused among the men due to the fact that no effective check was made on the reports rendered by the superintendents to the committee. Their word was practically final.

The committee was not very well known among the men, no advertising being used in order to sell the idea and no very definite stamp of approval was placed upon it by the management. Therefore all opposition to the suggestion system was quite open and active.

The changes which were made in order to bring the system into respect and make it effective were not changes of principle so much as changes of routine and personnel. The management gave its whole-souled support and chose men for work on the committee who were particularly suited for duties of that sort, and an advertising campaign was started to make the system well known and to encourage the men to use it. Meetings were held regularly, occurring once each week whether there was much business to be done or not; and an effective check was made on the reports of final decisions of the committee. With these changes and a general increase in the efficiency of handling suggestions, renewed interest on the part of the men was manifest, and from then on, the growth of the suggestion system has been gradual and normal.

It should be borne in mind that the above conditions prevailed as recently as six or seven years ago. The present "new" system, therefore, is not very many years old.

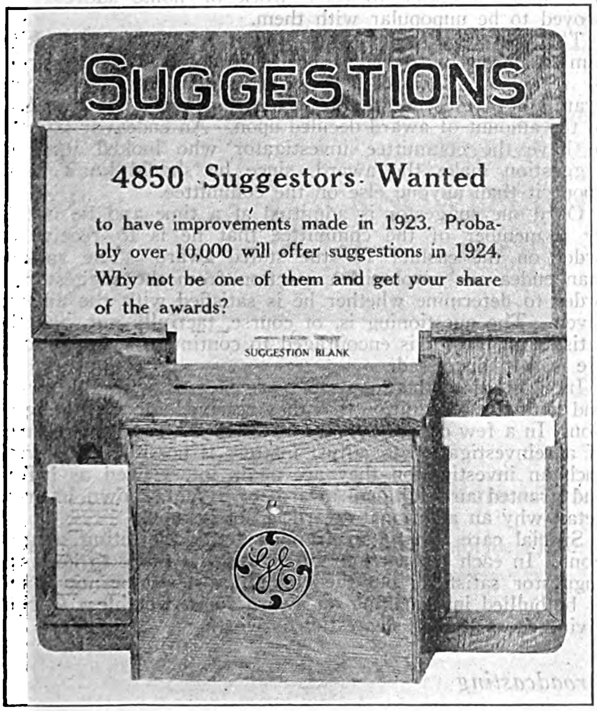
So much for the early history of the suggestion system—it is but a short step to present conditions.

To begin with, it should be noted that the company does not follow a standard practice in all its different works. Unification of this work has recently been undertaken and satisfactory progress is being made toward standardization along the lines which, from this company's experience, appear to represent the best practice. The outline which follows covers the general principles upon which the General Electric system as a whole is based, but special reference is made to Schenectady practice since it is the largest works.

Suggestion Boxes

In the first place, suggestion boxes are installed at convenient points throughout the factory and offices. At first they were located in out-of-the-way places on the supposition that employees were rather sheepish about offering suggestions. This was not found to be the case, however. Placing the boxes near exits, time clocks, bulletin boards and drinking fountains has been found to be more effective. The number of boxes provided approximates one for every 200 employees in our large plants, and one for every 100 employees in our small plants. The type of box recently adopted as standard is shown in the accompanying illustration, the dimensions of the bulletin board behind the box being about 18 in. wide with the other dimensions in proportion, as shown. (See Fig. 10.)

A great variety of boxes was tried out, ranging from the familiar metal rural delivery box to a simple wooden box of about the size and shape of the box proper, as shown in the illustration. The most satisfactory form is that shown in which the box is mounted on a back board which provides a rack for display of advertising cards, one for envelopes already addressed to the suggestion committee, another for cards requesting a personal interview (for use by suggestors who can not express themselves well in writing) and another for a pad of suggestion blanks upon which suggestions may be written.



SUGGESTIONS
4850 Suggestors Wanted
to have improvements made in 1923. Probably over 10,000 will offer suggestions in 1924.
Why not be one of them and get your share of the awards?
SUGGESTION BLANK

FIG. 10—SUGGESTION BOX—GENERAL ELECTRIC COMPANY.

Advertising

Too much emphasis can not be placed upon the value of the advertising posters which are placed on the boxes. These have been found so valuable in stimulating interest in the suggestion system that the company has arranged a standardized service to provide uniform cards to all works with a monthly change of copy. In these cards an endeavor is made to avoid sermonizing and dry reading. To provide conspicuous cards which will agreeably contrast with the general run of shop notices use is made of colored cards, employing catchy illustrations and type treatment along the same lines as the street car cards. Interest in the system is also maintained by publishing suggestion news in the several works' papers and by talks on this subject by company officials.

Advertising pressure is kept up constantly and the problem must be tackled from every possible angle in order to break down prejudice, overcome supervisory opposition and most of all, overcome inertia and indifference. The object of advertising is not merely to obtain suggestions, but to obtain *good* suggestions. The committee desires to avoid being swamped with a large number of trivial suggestions.

Collections

In the Schenectady works, members of the patrol department make semi-weekly visits to the various boxes to gather the accumulated suggestions which they turn over to the suggestion committee secretary. In some other plants these collections are made by some member of the committee. In no case are collections made less frequently than once a week.

Classifications

When suggestions are received from the collector by the suggestion committee secretary he classifies them according to his filing system. This is generally straight numerical filing in which the suggestions are consecutively numbered in the order in which they are received. Each suggestion is also stamped with the date of its receipt, is recorded by number, name of suggestor and sometimes by title of suggestion, and is then turned over to the department concerned for investigation.

Investigation

The department head appoints a man to investigate the suggestion, who is usually a member of his own staff. In the investigation this man always makes an effort to interview the suggestor in order to make sure that he understands what the suggestor has in mind. The report which he renders states whether or not it will be adopted and if it is possible to estimate savings, a savings figure is given. If not, he recommends an award to be given. From the department, the suggestion goes back to the committee secretary, who then refers it to one of his own investigators for reinvestigating and reporting to the committee. If the committee investigator finds the recommendation of the department adequate and fair, he disposes of the rejections courteously and with great care by a personal interview with the suggestor; those adopted he brings before the committee with a full description of all details and a recommendation of the size of the award. If the committee investigator deos not find sufficient reason for rejection, he takes the matter up with the department investigator. He likewise does the same thing in the event that the saving or the recommended award is not adequate. In all cases the suggestion committee and the department come to an agreement in regard to a suggestion. One always convinces the other.

From this it will be readily appreciated that the ability and personality of the secretary and investigators is a great factor in the success of the system. A great deal of responsibility is placed on their shoulders. It is their duty to keep the men satisfied and inspire their confidence. They give the system its personality in the eyes of the men. A good secretary and efficient investigators are probably the biggest single factors in its success.

Antagonism from some of the men in supervisory positions was at first experienced. This has been largely overcome by repeated declarations from the management that suggestions are desirable and regarded as an indication of a department's progressiveness. Employees are encouraged to have faith in their superiors and to enlist their cooperation in attempting to make their suggestions successful.

When possible the investigator obtains samples embodying the suggestion. Savings figures are obtained from the cost department whenever possible, since the awards granted for adopted suggestions are always based upon estimated savings when these are determinable.

Many kinds of suggestions are received representing improvements in design, convenience, safeguards, and improvements in manufacturing methods. Some of these suggestions effect a determinable saving by reducing the cost of manufactured parts; others by improving shop equipment for producing parts. Still other suggestions, such as those relating to safety appliances, conveniences of employees, improvement of products and the like, do not always permit the determination of their cash value. In such cases, the award is based upon an estimate of the importance of the suggestion.

Even where an actual saving can be determined, the award varies according to the ingenuity and effort required of the suggestor. Obviously, a suggestor who effects a saving of several thousand dollars a year by substituting a punched part for a molded one does not spend the effort required of the suggestor who on his own time and at his own expense produces an ingenious device upon which production is small.

It should be noted that the adoption of a suggestion, or rather the granting of an award, is not necessarily based upon the absolute originality of the idea. It does not have to be an invention or a startling innovation. The fact that not more than five out of the five thousand suggestions received at Schenectady in 1928 were patentable will serve to illustrate this point. It may even be a thing which has been suggested before but, due to negligence on the part of supervisors, has not been applied wherever possible.

At this point it will be well to explain that obviously impractical suggestions are rejected by the secretary without being referred to the department concerned. It should also be noted that the usual practice is to exclude salaried executives, engineers and draftsmen when making awards. Their suggestions are received and acted upon and then called to the attention of the heads of their departments or their supervisors.

Committee

As stated, the adopted suggestions are turned over to the suggestion committee. This committee usually consists of a permanent secretary (who, in the larger plants, devotes his entire time to this work), a permanent chairman, or a chairmanship rotated among the committee members, and four or more additional members generally taken from the manufacturing organization.

The committee membership generally comprises manufacturing executives, such as the electrical and mechanical superintendents, etc., together with any special investigators who devote their entire time to the suggestion work. It has been found good practice to include in the committee a member familiar with electrical engineering, one familiar with electrical operation or testing, one skilled in mechanical design and machine shop practice and possessing a good knowledge of machine tools, and a cost man to determine savings. In some of the General Electric Company's works, where there is an employee's council, the employees are permitted to select representatives to act with the suggestion committees in passing upon suggestions.

Meetings

Considerable importance is attached to the speed with which the suggestions are handled. Best results follow when a suggestion can be completely disposed of within one month. This time is always aimed at although there are many suggestions which require greater time for a verification of their worth. In order to keep the time at a minimum, however, most of the committees meet once each week on a specified day. The first business is to hear the secretary's report of the number of suggestions received during the week, number reported upon, number awaiting investigation and the number pending (awaiting test requiring time) in order to check operation or saving. Following this, the awards granted a year previously are reviewed to see whether the suggestor received a sufficient award as determined by the year's operation. Where it seems desirable, figures are obtained and a supplementary award is granted to adjust compensation to its proper value.

A report of the pending suggestions is then made if the time determined for them has elapsed. If complete information permits, their consideration follows, and the awards are determined for those which have been adopted. The committee then considers new suggestions. These are read by the secretary or some other member of the committee and each in turn passed upon and awarded upon its merits. The awards average approximately 10 per cent of the estimated savings for the first year.

Awards

The final act is to interview the successful suggestors of the preceding week and issue the awards in the form of cash orders, payable on presentation to the cashier. For large awards suggestors may choose to take Employee's Investment Bonds in multiples of $10. In this case their bonds are mailed to them, but the practice of mailing checks to employees either to their work or home address has proved to be unpopular with them.

The secretary writes each successful suggestor asking him to appear on a certain day the following week in order to receive his award. The notifications contain a congratulatory reference to the suggestion and a statement as to the amount of award decided upon. An endeavor is made to have the committee investigator who looked into the suggestion make the award, since he should know more about it than anyone else on the committee.

Only one suggestor is admitted at a time and he is told by a member of the committee that he is to receive an order on the cashier for the stated award. The spokesman endeavors to obtain a reaction from the suggestor in order to determine whether he is satisfied with the amount given. The questioning is, of course, tactfully put, and the satisfied suggestor is encouraged to continue the good work. He is then dismissed.

In most cases the suggestors are pleased with the award and with the recognition that they received for their suggestions. In a few cases, they are dissatisfied. These are assured of a reinvestigation to adjust matters if possible. Following such an investigation they are again interviewed as before and granted an additional award, or, if not, shown in great detail why an additional award is not granted.

Special care is used in framing letters rejecting suggestions. In each transaction, an endeavor is made to keep the suggestor satisfied; but the committee never permits itself to be bullied into making an award for a worthless idea or giving more than a suggestion is worth.

Broadcasting

In order that the suggestion committees may follow a more or less standardized practice, a man in the manufacturing

general office is appointed, whose duties are those of a general secretary. He keeps in close contact with all committees by correspondence and by personal visits. It is his duty to do the general advertising and to lend assistance in helping individual committees out of their difficulties. Also, all suggestions of more than local interest are sent to his office for broadcasting to the other works in order that the greatest possible benefit may result from them.

If a suggestion which has been broadcast to all the works through these channels proves of considerable benefit, the suggestor is usually given an additional award based on these benefits.

Absolute fairness is the life of the system.

WESTINGHOUSE ELECTRIC & MANUFACTURING COMPANY

Suggestion System

The Westinghouse Electric & Manufacturing Company's suggestion scheme was put into effect about July 20, 1910. More than 32,500 suggestions have been received by all works of which number about 25 to 30 per cent have been adopted. A considerable number were vetoed, although meritorious, simply because the company was unable, for various reasons to make use of them. Details of the system are given in the accompanying illustrations showing form 3065, sketch C-7901 and shop-mail card. Fig. 16, 17 and 18.)

The estimated savings from individual suggestions have varied from zero to $20,000.00 per year, the awards being made on the basis shown in Table V. Many suggestions, however, while representing improvements involve an outlay of money so that payment on the basis of savings effected is not a practical scheme and the awards should accordingly be looked upon rather as prizes. The majority of the suggestions are small in value being in the $2.50 class; a lesser number in the $5.00 class, and so on.

It may be mentioned that the American Museum of Safety

TABLE V

Scale of Awards

$2.50	Suggestions which are neither original nor have appreciable money value yet which should be adopted, perhaps being modified before adoption, even when expense is involved.
$5.00	Suggestions which are not original but have appreciable money value difficult to estimate.
$10.00	Suggestions which are not original but have considerable money value estimated on an annual basis. Suggestions which are original but have no appreciable money value.
$15.00	Suggestions which are original and have considerable money value.
Above $15.00	Special.
$5.00	For first five suggestions accepted.
$10.00	For second five suggestions accepted.
$15.00	For third five suggestions accepted.

Westinghouse Electric & Manufacturing Company

Vice Pres. & Gen'l Mgr.
Letter #12

SUGGESTION SYSTEM

TO ALL EMPLOYEES:

As is generally known, it has been the practice for several years in some of the Company's plants, to encourage employees to make suggestions regarding methods, designs, working conditions, etc., with the aim of improving the quality of the apparatus, reducing costs, and increasing the efficiency of production, which, of course, is to the advantage of all concerned. Monetary awards have been made for such suggestions as have been adopted with amounts graded in proportion to the importance of the resulting improvement in operation, and the system wherever installed has demonstrated its value both to the Company and to the employees.

The application of the Suggestion System is now extended to all branches of the Company's activities, so that every employee may submit ideas or suggestions which his or her experience and knowledge indicate as being of value.

Suggestions need not be confined to that branch of the Company's activity in which the employee is engaged and no idea should be considered too trivial. It is often the case that, although a particular suggestion may not be adopted as submitted, it may lead to something of real value and awards have been made on this basis.

In short, any suggestion will be considered that has for its aim the improvement of the apparatus as to quality, cost, simplicity or reliability. Likewise, suggestions as to methods of manufacture, handling, packing, shipping, substitution of materials, finishes and workmanship are acceptable. Other subjects of equal importance are ventilation, sanitation, lighting, economies, wastes, prevention of accidents, prevention of fires, suggestions as to equipment, tools, operations, jigs, templates, transportation systems, storage of supplies, as well as methods employed in handling District, Headquarters and Factory corresponednce, filing and general office routine.

Awards for suggestions adopted will be made and, in addition, extra awards will be paid to those employees whose adopted suggestions total five, ten, etc.

The spirit of the Suggestion System is to keep the name "Westinghouse" synonymous with Quality and Efficiency by utilizing the combined efforts of all those connected with the Company.

All communications, suggestions, etc., should be addressed to the Suggestion Committee, Westinghouse Electric & Mfg. Company, East Pittsburgh, Penna., unless they originate in a plant in which a local suggestion committee has been organized.

Date: March 9, 1928 VICE PRESIDENT & GENERAL MANAGER

Works Dept.
Printed in U.S.A.

Westinghouse Electric & Manufacturing Company

SUGGESTION BLANK

See other side

With a view to improving, wherever possible, its apparatus and the conditions under which it is manufactured, and of effecting a net saving of time, money, labor or material, the Westinghouse Electric & Manufacturing Company invites practical suggestions and criticisms from all employes throughout the Works and Offices, and will award prizes, varying in amount, for original suggestions which are accepted. Heads of departments, superintendents and members of the Engineering Department under patent agreement are not eligible for prizes, and foremen, inspectors, demonstrators, engineers, draftsmen, rate and production men only for suggestions as to matters outside of their own lines of work.

Suggestions should be sent to the Suggestion Committee through the shop or office mail. Their receipt will be promptly acknowledged. If the regular suggestion blanks, Form 3065, are not available any kind of paper may be used.

All suggestions will be passed upon, whenever possible, within thirty days, by the Suggestion Committee, and those submitting them will be notified as to the action taken.

No suggestion is of too small importance to submit for consideration.

It must be appreciated that in some cases suggestions which are original with the sender will have been previously considered, or thought of by someone else, and the statement of the Suggestion Committee that any suggestion is not a new one must be accepted in good faith, even if the suggestion has not been used at that time and is put into effect later.

Regular awards will vary in amount from $2.50 and upwards, depending upon the value of the suggestions to the Company.

An award of $5.00 in addition to the regular awards will be paid, upon the acceptance of five suggestions from any one employe. $10.00 for ten suggestions; $15.00 for fifteen suggestions, etc. As an aid to the Suggestion Committee, employes are requested to send in their names as soon as five suggestions have been accepted.

Following is a partial list of subjects on which suggestions are desired, though any one is at liberty to submit ideas on any other subject:

IMPROVEMENTS IN

Apparatus	Factory and Office Conditions	Miscellaneous
Quality	Health	Machines
Cost	Cleanliness	Tools
Quantity	Sanitation	Operations
Simplicity or Reliability	Ventilation	Jigs and Fixtures
Packing or Shipping	Order	Templates
Handling	Prevention of Fire	Transportation of Material
Finish	Prevention of Accident	
Design	Lighting	Handling of Material
Workmanship	Power	Storage of Supplies
Material	Economy	System and Methods

awarded the company in 1913 a special medal for a very unique and original safety device which was received through our suggestion system. The Travelers Insurance Company also has advertised it in connection with its name throughout America.

The suggestion scheme has been applied to the employees throughout the shops, including workmen, clerks, inspectors, rate men and foremen, but in the case of foremen, inspectors and rate men, the suggestions must fall outside of the line of their regular duties.

The engineering department (clerical force excepted) is not eligible for awards, although members of the department may and do enter suggestions; if adopted, they are sent a special letter of thanks accompanied by the statement that no award has been made on account of being connected with the engineering department.

It used to be our practice to collect every week all suggestions that had been deposited in locked boxes throughout the various departments of the works, but the shop mail has now been substituted. (See Fig. 19.)

Upon receipt, suggestions are serially numbered and acknowledged on form 3067, shown in Fig. 20, after which they are referred to the suggestion committee. All suggestions are indexed in two ways; (1) in alphabetical order of employees' names; (2) according to kind of suggestion. Carbon copies of this same form (3067) are used in making both of these indexes.

A suggestion committee of four members consisting of one permanent member (the chairman) and three others (rotating at periods of about twelve months) passes upon all suggestions. Of the members of the committee two are drawn from the heads of various manufacturing departments and one from the shop committee.

If the committee is, of its own knowledge, unable to decide on the merit of a suggestion, (and this is largely the case), it is referred to the head of the department directly concerned, the name of the party entering the suggestion being, however, withheld as a rule. If a favorable reply is received, the suggestion committee then determines upon the amount of the award. When a sufficient number of suggestions have been favorably acted upon, they are listed

Suggestion
Committee

FIG. 20—Suggestion Acknowledgment Form—Westinghouse Electric & Manufacturing Company.

and presented usually semi-monthly to the works manager who, with the vice-president, either O.K.'s or modifies the award recommended.

When the first five suggestions have been accepted from any individual an extra award of $5.00 is paid; for the second five accepted suggestions an extra award of $10.00 is paid, and so on.

In the event of an award being made, the party entering the suggestion is notified on form 3069, illustrated in Fig. 21, and this notification is followed in due course by a check. A card, shown in Fig. 22, accompanies check whereon employee's signature is affixed acknowledging payment. Cards also are made out for each adopted suggestion and when filed serve as a record of the total number credited to any one employee toward an additional award. If, however, the suggestion is not accepted, a personal letter is sent to the employee giving the reason for being unable to make use of it. The stenographic work can be saved by the use of form 12383, illustrated in Fig. 23.

Reports on suggestions which are referred to other departments are made to the suggestion committee in triplicate. A copy of this report together with form mentioned is then forwarded to suggestor as final reply.

A list of suggestions adopted is posted in the monthly shop paper giving the title of the suggestion and the name of the employee who made it, but usually omitting the amount of the award although awards have been published as well on occasions. Occasionally the employee requests the omission of his or her name, in which case, when publishing the adopted suggestion, the statement is made that the name of the employee is omitted by request.

SUGGESTION COMMITTEE

FIG. 23—NON-ACCEPTANCE NOTIFICATION FORM—WESTINGHOUSE ELECTRIC & MANUFACTURING COMPANY.

PROGRESS IN GENERATOR DESIGN AND PRACTICE

During the last few years, due largely to revolutionary advances in the art of steel welding and cutting by flame and arc, great changes have occurred in the mechanical construction of electric generators.

Concurrently, the demand for generators of greater capacity, due largely to the advancing practice of system interconnection and the requirement for higher quality and longer life, has resulted in the development of new practices in the electrical design, construction and application of generators.

This report of the Electrical Apparatus Committee is intended as a concise, but comprehensive, digest of the present state and trend of the art, and is presented in the form of statements by four of the larger manufacturers.

MANUFACTURERS' STATEMENTS

STATEMENT BY THE ALLIS-CHALMERS MANUFACTURING COMPANY

Structural Steel and Welding

During the past year there has been built a number of generators and motors having parts such as stator yokes, bases, rotor spiders, and bearing pedestals for roller bearings constructed of electrically welded steel parts. There is at present under construction a 25,000-kw., 143-r.p.m. horizontal waterwheel generator, whose stator yoke will be electrically welded throughout. This yoke will have an outside diameter of 26 ft. and will weigh approximately 58,000 lb. Experience so far with welded frames and bases has been quite satisfactory, there being a considerable saving in pattern work and pattern storage, and it is expected that the use of this type of construction will undoubtedly become very general. Although the frames made from structural shape and steel plate have ample strength, there is danger, if care is not taken in the design, that sufficent stiffness and rigidity will not be obtained. In fact, cast iron has definite advantages from the point of view of rigidity, but there is no reason why welded frames cannot be so designed and braced that they will be equally good in this respect. Examples of the new type of construction are illustrated in Fig. 1, 2 and 3.

Other Mechanical Advances

During the past year there have been completed and put into operation three large hydro-electric generators, which are of interest in respect to their mechanical design. They are believed to be the largest machines in operation of the so-called umbrella type. Two of these machines are rated at 27,500 kv-a. and 90 r.p.m., and one is rated at 22,500 kv-a. and 75 r.p.m. One of the 22,500-kv-a. machines is shown in Fig. 4. These machines have only one guide bearing each, and both the thrust bearing and the guide bearing are mounted under the rotor. There being no upper bridge, the whole weight of the rotating parts is carried by the spider under the generator. Generators of this type are specially suitable for semi-outdoor power stations, and it is possible, by mounting the generators outdoors and covering them with sheet-steel enclosures, materially to reduce the cost of the power house. With this design it is also possible readily to obtain access to the stator winding merely by lifting the rotor off the shaft, with the bearings and other parts left in place. These machines operate fully as well mechanically as those of the conventional double-guide-bearing design. The single-guide-bearing design is best adapted for large moderate-speed units, which have rotors of large diameter. The design, however, is not suited to large high-speed generators, which have rotors of relatively small diameter and considerable axial length, since it is not possible to place the guide bearing sufficiently high to keep the overhang of the rotor with respect to the bearing within safe limits, and at the same time to have the thrust bearing in a readily accessible location.

Insulating Compounds

In large generators, and particularly in those operating at 6600 and higher voltages, "Class B" (mica) insulation is recommended for the stator coils, even if the operating temperature is within the limit for "Class A" (fabric) insulation. The longer life of the mica insulation and its ability to resist damage from corona make it desirable in large units regardless of temperature. Extensive tests have shown that an asphaltum-base varnish or binder is superior to shellac or linseed-oil varnish for stator coil insulation, and mica coils are now made with this type of varnish exclusively. Life tests have shown that the asphaltum-base material is not affected by corona to anywhere nearly the same extent as shellac, which, in the course of long-continued operation, is likely to disintegrate. Another advantage of the asphaltum material is that it retains its flexibility, not becoming as hard as shellac or linseed-oil varnishes.

Higher Voltages

Generators have not been built for voltages higher than 15,000. So far as generators themselves are concerned, higher voltages are not desirable, but, in order to limit the current handled by oil circuit breakers, there has been a demand for higher voltages in machines of very large capacity. Such machines can be built, although, of course, thicker insulation is necessary, and less efficient utilization can be made of the slot space. It is also necessary to take special precautions as regards corona. It would seem that more consideration might be given, in attempting to limit the current handled, to subdividing the output from large units by using windings of more than one circuit per phase and thereby reducing the current by half or more.

Transposed Windings

During the past two years a number of machines have been built with transposed armature conductors. Such an arrangement is advantageous for large units, and also for smaller units wound for low voltage and high current. In large four-pole machines where only four parallel circuits are available, the depth of conductor becomes so great that some form of transposition is desirable in order to reduce the eddy-current losses and heating, but it is not advisable to introduce the complication and expense of transposed conductors in the case of machines where the eddy-current loss can be kept within conservative limits by the use of multiple circuits, as can be done, for example, in most waterwheel generators. Another advantage of the transposed conductor is that it reduces the number of turns per coil and, therefore, the number of conductors per slot, thereby making the machine less liable to breakdown between turns.

Divided Circuits

As stated above, large generators can, if desired, be built with divided circuits, thereby reducing the output of any one winding. Where such divided circuits are used, it is necessary to employ protective means to insure against overloading any one of the circuits in case of trouble.

Structural Steel and Welding

Up to the present time use has not been made of structural steel to any great extent.

Other Mechanical Advances

In the effort to minimize capital outlay for power stations, the tendency is always toward larger units and higher speeds, and the construction of alternators has been forced to keep pace with this progress.

Radical improvements in design have led to the development of high-speed, steam-driven turbo-generators of large capacity. A machine rated at 32,500 kv-a. and 3000 r.p.m. has been placed in operation, and two machines, each rated at 40,000 kv-a. and 3000 r.p.m., are now under construction.

Improvements have similarly led to the development of waterwheel generators of large capacity. Contrary to American practice, machines having horizontal shafts are often preferred to the vertical type in foreign countries. Three three-phase, 30,000-kv-a., 8000-volt, 42-cycle, 420-r.p.m. waterwheel generators, installed in an Italian power house, are shown in Fig. 5. The largest single-phase alternators ever built of such low frequency as is sometimes required for railway work have been constructed for the Swiss Federal Railways and installed in the Barberine Power Station. These units are rated at 10,000 kv-a., 15,000 volts, 16⅔ cycles per second and 333 r.p.m., and are illustrated in Fig. 6. Fig. 7 shows that the stator of one of these machines is supported on rollers in such a manner that it may be easily rotated for inspection or repairs.

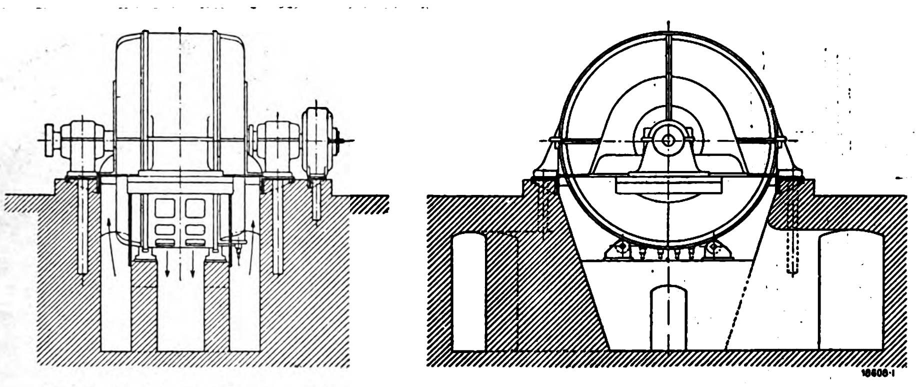

FIG. 7—THREE-PHASE BROWN-BOVERI ALTERNATOR WITH MOVABLE STATOR.

With respect to hydro-electric units with vertical shafts, one of the most important components is the thrust bearing, which has to carry the weight of the rotating parts of both alternator and turbine, together with the hydraulic thrust on the latter. Thrust bearings for this purpose are made of two types. For moderate loads and low speeds the design is suitable in which the running surfaces are of one piece and are spherically seated. For thrusts up to 500 tons and for high speeds the usual one-piece bearing surface is replaced by a number of separately pivoted segments. Such a bearing, for a pressure of 350 tons and 100 r.p.m., is shown in Fig. 8. The segments are supported somewhat eccentrically and, when the shaft is running, take up such a position that a wedge-shaped oil film forms between each segment and the surface of the thrust collar on the shaft. In this way contact of the surfaces is prevented and friction losses are made extremely small. The load is uniformly distributed between segments in a most effective manner by means of steel balls, as is also shown in Fig. 8. The lower bearing bracket is provided with supporting bolts, upon which the rotor can rest after it has been raised for inspection or repairs. Several different designs have proved that bearings of this type are completely reliable under the most unfavorable conditions, even at speeds as low as those which occur during starting and slowing down.

Under certain conditions, such as when the speed of the waterwheels is low and direct-coupled generators would be too costly or too large, it may be advantageous to employ geared drives. Modern spur gearing is suitable in such cases for very high powers and large ratios, but the application of bevel gears in this respect is very limited. It is possible, for example, to drive a generator at 1000 r.p.m. from a turbine running at 100 r.p.m. As the cost of the gearing is considerable, it must be carefully investigated in every case whether geared drive or direct coupling is the more advantageous. It has generally been found that gearing should be employed when the output exceeds 1000 to 2000 kw., and the turbine speed is as low as 80 to 100 r.p.m.

Insulating Compounds

The insulation used is the result of research and experience extending over many years, and insures the production of coils capable of meeting the strictest requirements, both electrically and mechanically. The impregnation process in particular prevents the ingress of all air and moisture, and thereby eliminates all danger of the formation of ozone. The solidarity obtained by the impregnation and pressing processes obviates any tendency of the individual conductors to become loose and consequently to vibrate.

The final layer of insulation consists of a micanite sheath on the straight portions and several wrappings of varnished tape on the coil heads. The former is made up of micafolium, a thick, tough paper faced with flakes of mica. Shellac is used only for the micafolium wrapper, the impregnation of the coil before the wrapper is put on being done with a bitumen-base insulating compound. This compound is also used for impregnating the coil heads.

Insulation of this type is used on all steam-driven turbogenerators, except low-speed units of low voltage, which are provided with "Class A" insulation. It is recommended for continuous service at all temperature rises up to 75 deg. cent. above an ambient temperature of 40 deg. cent., and has proved to have a very long life.

Higher Voltages

A great deal of experience has been had in the building of high-voltage generator windings. As early as 1910 five three-phase generators, each rated at 3000 kv-a. and 17,600 volts, were built for the Bernese Power Supply Company of Switzerland, and are still in satisfactory operation. Numerous generators for this voltage have since been built, a noticeable example being the single-phase railway alternators previously referred to. These machines have been in operation since 1920 at 16,000 volts, with one pole permanently grounded, and are subjected to all the voltage surges coming in over the contact line, which is fed directly from the power station without intermediary transformers.

In the case of high-voltage windings, particularly when one pole is earthed, and in the case of windings designed

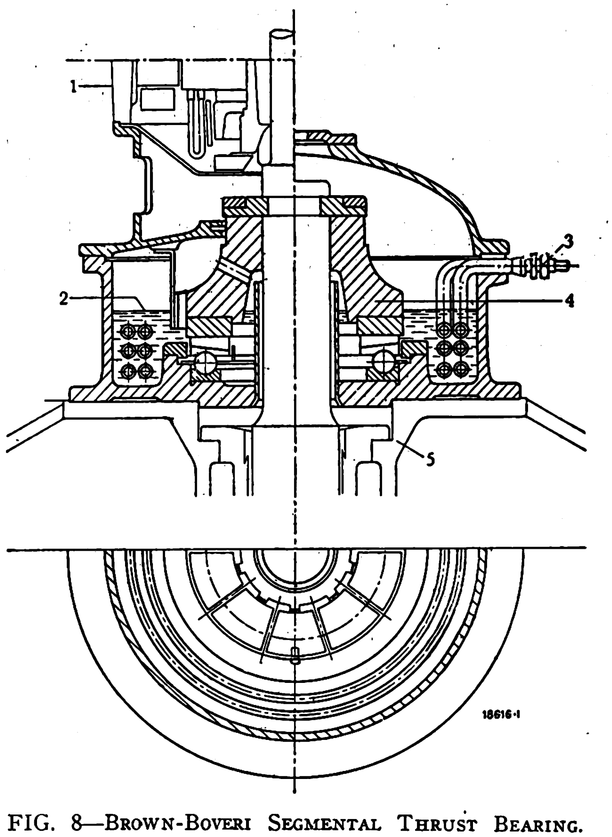

FIG. 8—BROWN-BOVERI SEGMENTAL THRUST BEARING.

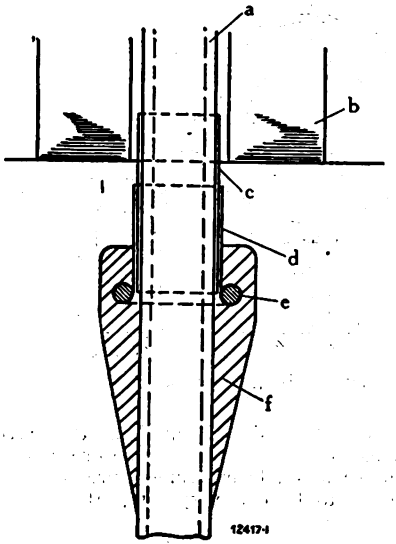

FIG. 9—CORONA-EFFECT PROTECTION USED ON HIGH-TENSION BROWN-BOVERI ALTERNATORS.

for a test voltage of three or more times the rated voltage, unless precautionary measures are taken, it is inevitable that the air dielectric in the slight spaces remaining between the coil insulation and the slots will be overstressed and will consequently be the source of discharge effects. By way of remedy, the insulating sheath of the coil is provided with a coat of conducting varnish, shunting the air space between coil insulation and stator iron. Conditions are particularly severe in the case of traction alternators, such as those previously mentioned, where, on account of the unfavorable flux distribution, discharges endangering the coil insulation are likely to occur at the edges and the corners of the teeth and the clamping plates in the neighborhood of the points where the conductors leave the iron. In order to prevent such discharges, the coils of the machines of this type are provided, at the points where they leave the core (Fig. 9), with a narrow conducting sheath (c) of tin-foil, over which a sleeve of conducting material (brass) is drawn. Due to the connections thus made between the iron core and the sleeve, the surface of the coil at this point is artificially brought to the potential of the core, i.e., to earth potential, and all discharge phenomena can be easily and effectively eliminated by covering this edge with a layer of insulating material after the edge has been rounded off.

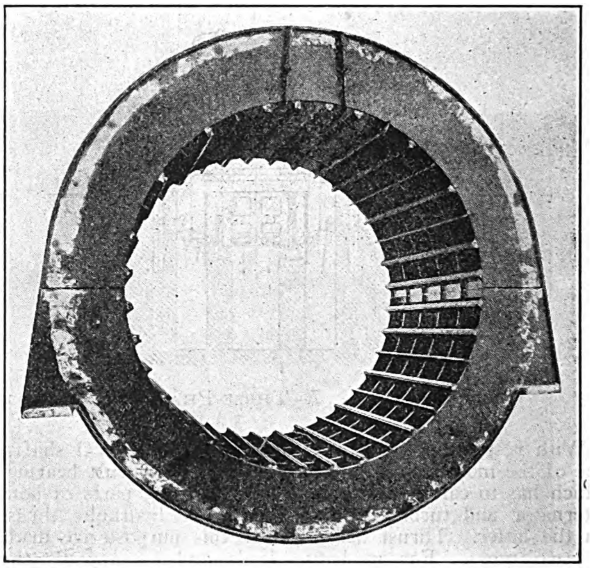

FIG. 10—STRUCTURAL-STEEL STATOR FRAME OF 50,000-KV-A. GENERAL ELECTRIC SYNCHRONOUS CONDENSER FOR SOUTHERN CALIFORNIA EDISON COMPANY.

Transposed Windings

The stator windings, being the most important part of alternators, demand the greatest care on the part of the designer. From the point of view of design, they are divided into two classes: coil windings and bar windings. Windings are considered to be of the latter type when each slot contains only one or two turns or bars, each bar being insulated for the full voltage. Such an arrangement is employed only when the current is in excess of 600 amperes.

When the bar becomes of considerable cross-section, it is advisable to employ some method of lessening to as great an extent as possible the eddy-current losses resulting from skin effect. The twisted-strand type of stator winding, in which the bars are built up of a number of strips and are transposed so that each strand occupies in turn every possible position in the cross-section of the slot, has proved to be the most satisfactory form of bar winding, and has the advantage of simplicity.

Divided Circuits

Divided circuits are frequently used in order to utilize the most suitable copper dimensions.

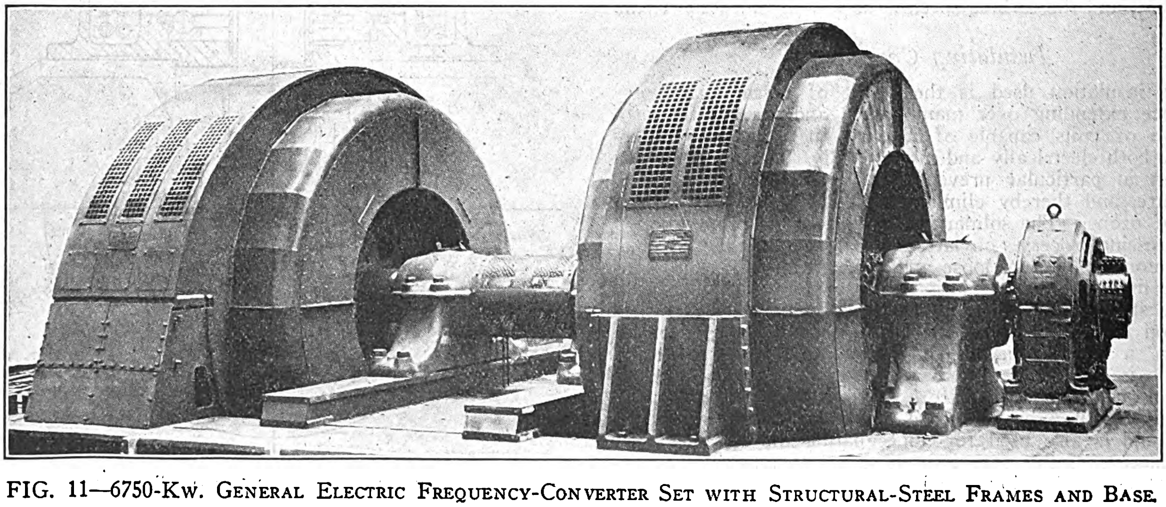

FIG. 11—6750-KW. GENERAL ELECTRIC FREQUENCY-CONVERTER SET WITH STRUCTURAL-STEEL FRAMES AND BASE.

STATEMENT BY THE GENERAL ELECTRIC COMPANY

Structural Steel and Welding

Salient-Pole Synchronous Machines

It is estimated that 90 per cent of the salient-pole synchronous machines as now designed are made of structural steel.

There are several reasons for the recent tremendous increase in the use of structural steel and welding as a substitute for the use of castings. The cost of constructing patterns and the expense of storing them, the loss occasioned by defects in the castings, and the likelihood of failure in service as a result of internal strains, blowholes and the like, are some of the disadvantages of the old method of construction. They have long been appreciated by the industry and have been tolerated only because of the fear that some other form of structure would give rise to other troubles of even more serious nature.

With the development of flame cutting of steel plate and with the increased knowledge of the art of welding, however, the designers have become convinced that steel plate will not only eliminate casting defects but will also produce better mechanical structures. In fact, factory tests have demonstrated that the new method of construction eliminates the disadvantages of castings, and produces a structure superior in strength and reliability to the cast structure, and one more able safely to withstand the shocks of handling and the stress of short circuits.

The welded-plate stator construction, as applied to horizontal units, is illustrated in Fig. 10 and 11, respectively. The side plates of horizontal units consist of segments cut from heavy rolled-steel plate, which are welded together by means of the hydrogen-enveloped arc. The use of this arc-welding process eliminates the necessity of scarfing the joints between segments and at the same time insures a ductile weld. The supporting feet of the units are cut out as part of the side plates, and a heavy foot plate is welded to these feet. The back plates are flame-cut, are rolled to the proper shape and are then welded to the side plates by an automatic arc-welding machine, which produces a practically perfect weld. The ribs for supporting the casting on which the stator laminations are stacked, are also welded to the side plates.

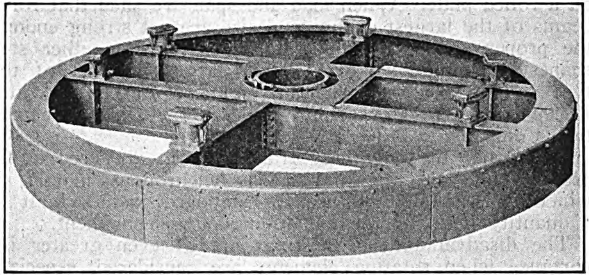

FIG. 12—TYPICAL GENERAL ELECTRIC LOWER-BEARING BRACKET OF STRUCTURAL STEEL.

With reference to vertical units the first application of structural steel to the lower guide bearing was made in 1921, in the case of the 20,000-kv-a. generators built for the Alabama Power Company. Since that time practically all vertical waterwheel generators of large diameter have been furnished with structural-steel lower guide brackets. Fig. 12 illustrates a typical lower guide bearing and bracket.

A typical upper-bearing bracket, carrying the thrust bearing for vertical waterwheel generators, is illustrated in Fig. 13. Standard rolled girder beams are employed in this design, and the appearance is improved by cutting off the ends of the beam in the form of an arc and by welding

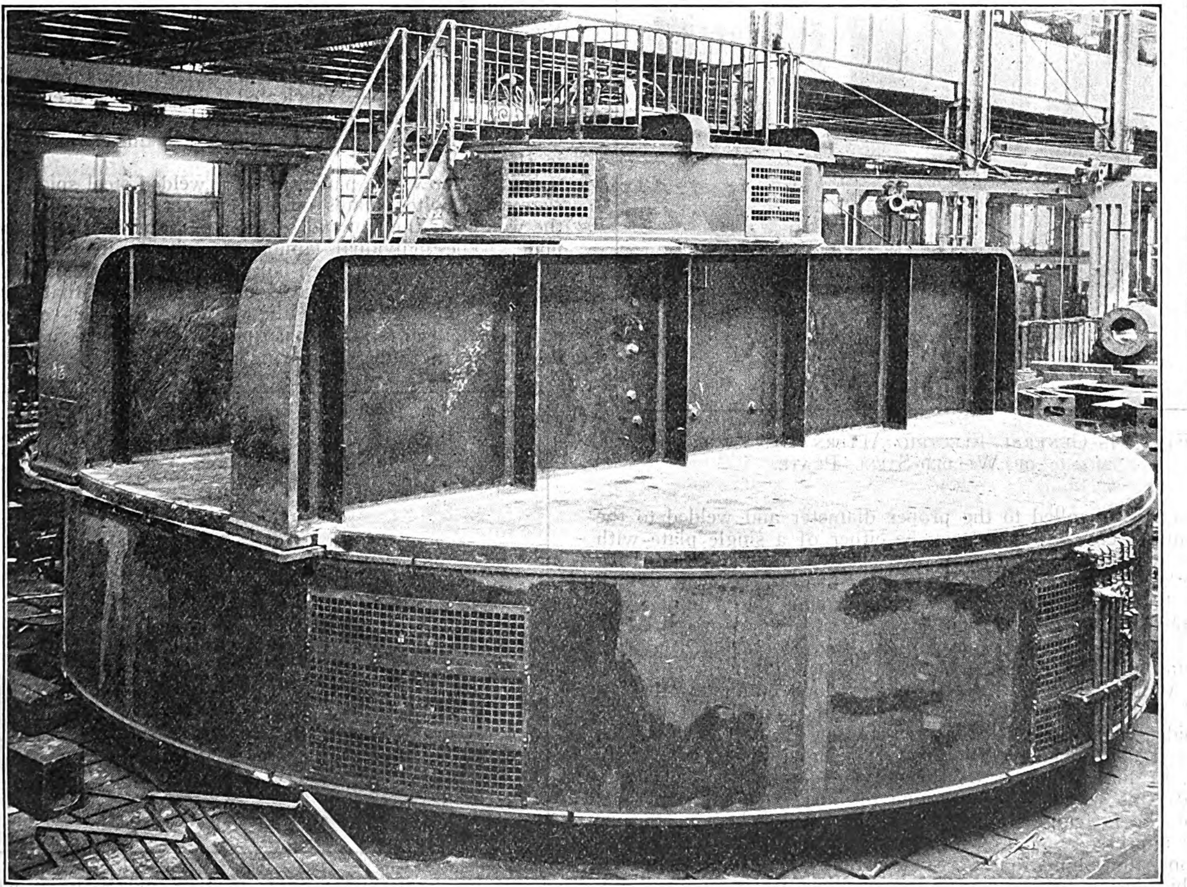

FIG. 13—19,000-KV-A. GENERAL ELECTRIC WATERWHEEL GENERATOR WITH AUXILIARY GENERATOR.

on a rolled plate. When load and span are such that rolled beams of the largest commercial size are not strong enough, the proper shapes are built up by welding together steel shapes of commercial sizes. The largest bracket of this type so far used supports a weight of 750,000 lb., in a 19,000-kv-a. generator recently sold to the Dixie Construction Company.

Practically the only cast frames which are used at the present time are for high-speed synchronous motors, in which it is possible to use the standard frames built on a quantity basis by the induction motor department.

The disadvantages of castings are of even greater importance when rotating elements are considered, especially those rotors which are subjected to high stresses from overspeed. As a result, structural-steel spiders of several types have been developed.

Spiders for small rotors have been built in considerable number of welded steel plate, one such spider being shown in Fig. 14. The hub is flame-cut from thick steel plate or from shaft stock, and is welded to a center web also flame-cut from heavy plate or stock. The outside rim is of steel plate, rolled to the proper diameter and welded to the center web. This rim may be either of a single plate with arc-welded butt joint or of two plates completely welded together around the outer edges. Since the rim is welded to both sides of the web plate around the complete periphery, the welded joint of the rim is not required to withstand the entire centrifugal force occasioned by the rotating of the poles.

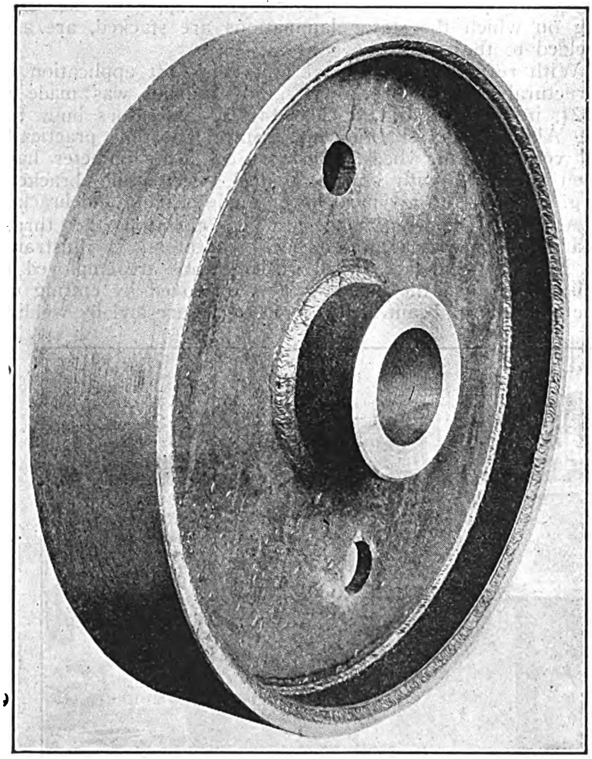

FIG. 14—GENERAL ELECTRIC ALTERNATOR ROTOR SPIDER OF WELDED-STEEL PLATE.

Another design of rotor spider which eliminates the use of castings is the so-called laminated punched type. A spider of this design is shown in Fig. 15, and it should be noted that such spiders can now be used in sizes up to 10 ft. in diameter, whereas the previous limit was about one-half this size. The ventilating openings and dove-tail slots for the fastening of pole pieces are all punched in advance by a press. Spiders of this type are usually built in sections, the laminations of each section being bolted together. This design has been used on machines of from five kv-a. to 100,000 kv-a. in capacity.

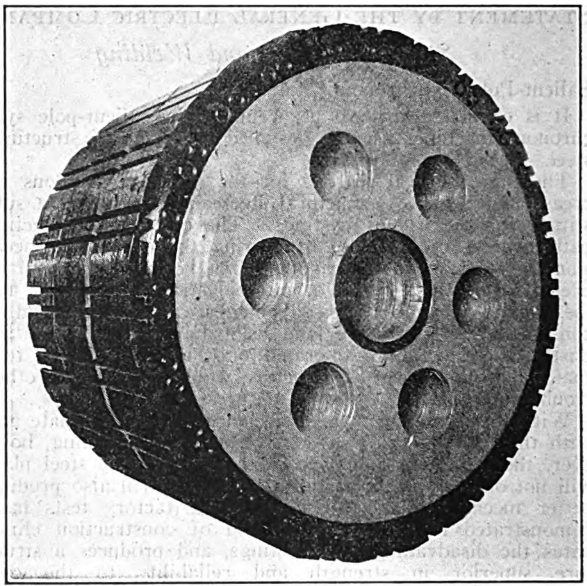

FIG. 15—LAMINATED STEEL-PLATE ROTOR SPIDER OF 30,000-KV-A. GENERAL ELECTRIC VERTICAL WATERWHEEL GENERATOR.

An entirely new development is represented by the rotor spider of the third general type. This spider has a free rim, made of segmental punched laminations mounted on a centering spider, which may be of either structural or cast construction. The laminated rim is not anchored to the centering spider, and therefore must carry all the centrifugal force occasioned by the rotating of the poles. Since the center has only to support the weight of the rim and of the poles, and to transmit the torque from the shaft, it is permissible to use cast material in this part of the structure. However, fabricated centers have been used in a number of machines, and it is expected that few cast centers will be used in future. This, the third type of spider, is shown in Fig. 16.

Fig. 17 shows the plate rim of a welded steel spider. The segmental bolted plates on the end serve as a support for the weight of the rim and of the poles, and also as a braking plate. The individual laminations, shown in Fig. 18, are held in place by through-bolts in reamed holes, the bolts being so designed for shear and compression that the rim has the same strength as the plates. The holes of square cross-section around the periphery are intended to have inserted in them the coil springs, which are designed to sup-

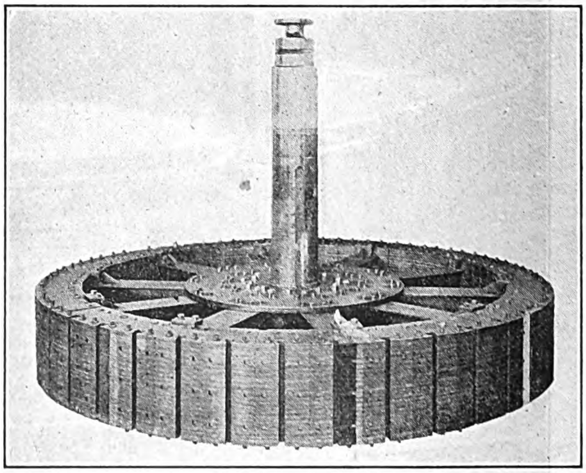

FIG. 16—STRUCTURAL-STEEL SPIDER, WITH FREE RIM, OF 9400-KV-A. GENERAL ELECTRIC VERTICAL GENERATOR.

port the field coils and to keep them tight regardless of insulation shrinkage.

Structural steel has been used in one way or another in a great many recent designs. The four 40,000-kv-a., 13,800-volt, 81.8-r.p.m. waterwheel generators for the Conowingo Station of the Philadelphia Electric system and the eight 12,550-kv-a., 14,000-volt, 100-r.p.m. waterwheel generators for the new hydro-electric station of the Louisville Gas & Electric system have their frames and lower-bearing brackets of structural steel. The three condensers recently sold to the Southern California Edison Company and rated at 50,000 kv-a., 13,200 volts and 600 r.p.m., have structural-steel frames, rotor spiders and ventilating shields, as has the 20,000-kw. frequency converter sold to the New England Power Company.

Turbo-Generators

Almost all large turbo-generator frames are built of structural steel and are constructed from flame-cut boiler plate. A rib support is welded to the inside of the supporting plate in order to secure sufficient surface for the bolting of the ribs. The ribs themselves are cut from steel plate and have machined surfaces, with a keyway left for supporting the punchings. On the outside of the circular supporting plates, which make up the sections of the units, there are welded ribs of steel plate for spacing and supporting the plates. This construction is illustrated in Fig. 19.

It is still the practice to cast out of non-magnetic steel the end flanges for large units. However, in the case of auxiliary generators and even in the case of some of the smaller main generators, the flanges have been made of steel plate. They have given very satisfactory service and there is, therefore, the possibility that plate flanges will be used in future on larger units.

On generators which are too large to ship with foot plates in place, the plates are made detachable, as are the steel-plate hoods covering the units. It is, therefore, possible completely to assemble the core and windings at the factory without exceeding shipping dimensions and weights. By constructing units in this manner, it is also possible to test them at the factory, such not having been the case with respect to large units in the past.

The outer shell for the large unit is also made of boiler plate and is rolled to fit the supporting plates of the unit, as illustrated in Fig. 20. All the partitions are of steel plate, welded to the shell, an air-tight cover for the unit thereby resulting. Some of the large units which have recently been constructed of structural steel include the 100,000-kv-a., 0.9-power-factor, 16,500-volt, 1500-r.p.m. unit for the Southern California Edison Company; the 235,000-kv-a., 0.85-power-factor, 22,000-volt, 1800-r.p.m. cross-compound unit for the State Line Generating Company; the 187,000-kv-a., 0.85-power-factor, 11,000-volt, 1800-r.p.m., cross-compound unit for the Amercan Gas & Electric Company, and the 160,000-kv-a., 1.0-power-factor, 11,400-volt, 1500-r.p.m. single unit for the New York Edison Company. The use of structural steel for the frames of the units mentioned above has resulted in the manufacture of stronger and lighter machines, and has made possible the shipment of the generators as assembled at the factory, with the exception of the New York unit.

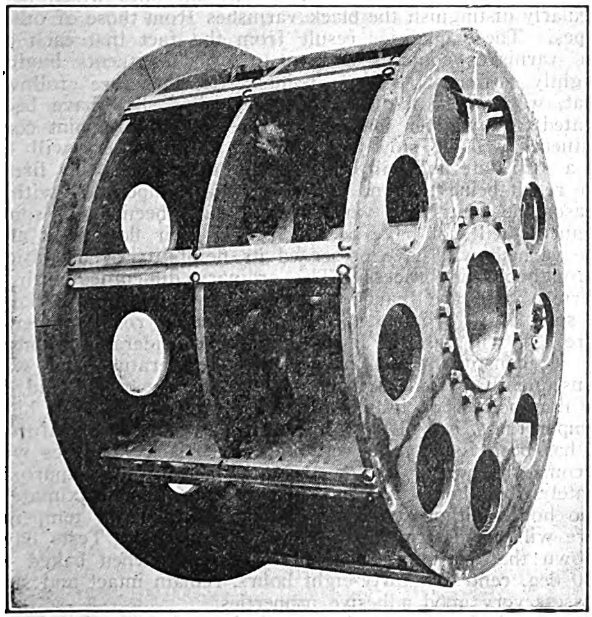

FIG. 17—WELDED-PLATE SPIDER FOR FREE-RIM ROTOR OF 20,000-KV-A. GENERAL ELECTRIC VERTICAL GENERATOR.

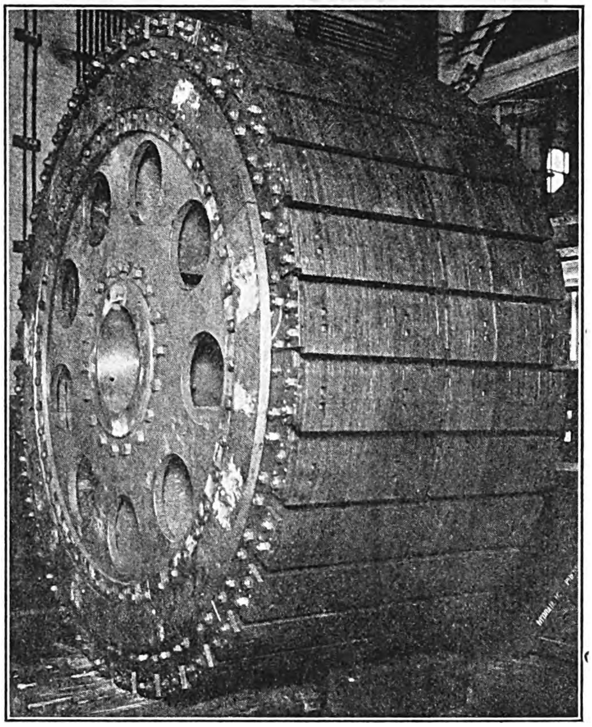

FIG. 18—LAMINATIONS AND SPIDER OF FREE-RIM ROTOR OF 20,000-KV-A. GENERAL ELECTRIC VERTICAL GENERATOR.

Direct-Current Machines

The mechanical structure of direct-current generators, motors and synchronous converters has been changed considerably in the last year or two. All the magnet frames for these units are now made of rolled steel, in two parts. Each of these parts is rolled into the form of a semi-circle, and then bolted together to form the magnet frame. Feet for supporting the unit are welded on to this frame. Rolled frames have been made in diameters as large as 160 in., with a thickness of 9¾ in. and a width of 26 in. In fact, in the case of a steel-mill motor, the frames were of such size that it became necessary to weld together two of these rolled frames to secure the proper width of magnet frame.

The rolled construction for magnet frames was adopted as a means of securing better commutation of direct-current machines, since there was felt to be less likelihood of flaws than in castings. Test results and experience with the rolled frame have justified its use and have proved conclusively that better commutation has been effected. In addition, the placing of the rolled frame on a so-called production basis has given rise to a less expensive unit than that with the cast frame.

One of the large synchronous converters constructed with rolled steel frame is shown in Fig. 21, the design being

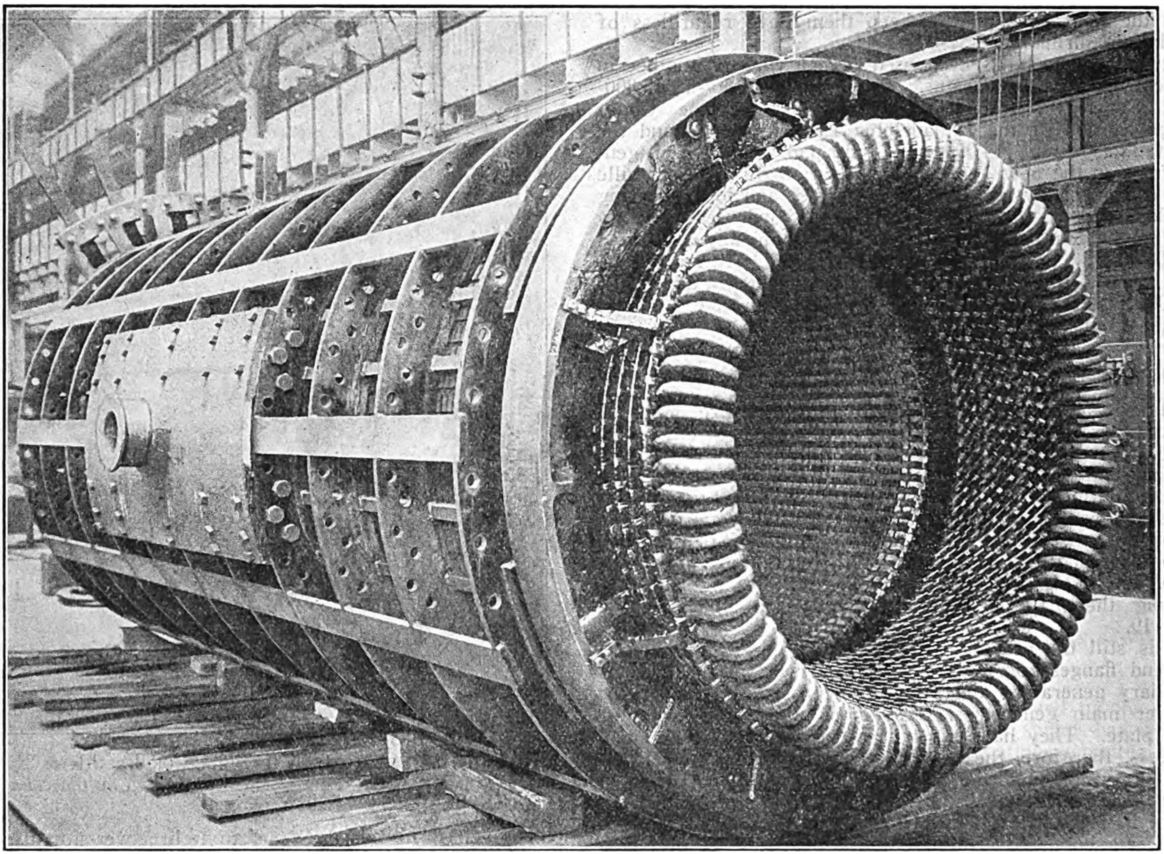

FIG. 19—STRUCTURAL-STEEL STATOR STRUCTURE AND ASSEMBLED WINDING OF 100,000-KV-A. GENERAL ELECTRIC TURBO-GENERATOR FOR SOUTHERN CALIFORNIA EDISON COMPANY.

typical of all new, large, direct-current generators, motors and converters.

On smaller converters and practically all motor-generator sets, the bases of the units are built of structural-steel shapes similar to the base of the small converter shown in Fig. 22. Bases of this type are easy to assemble, require no patterns and are much stronger than those of the cast type.

Other Mechanical Advances

There have in the past year been no other mechanical advances of sufficient importance to warrant their being mentioned in this report.

Insulating Compounds

Some of the early insulating varnishes were made by the dissolving of natural resins in alcohol or similar solvents. Such insulating media are characterized by a yellowish transparent color and are the so-called copal or shellac varnishes. Whereas these varnishes present an excellent appearance when first applied and so long as kept at low operating temperatures, it is unfortunately the fact that they ultimately lose their insulating properties due to their becoming dry and brittle, with consequent developing of cracks. Another defect of the yellow varnish as a base for insulating compounds is its hygroscopic quality.

The so-called black or bitumen varnish was developed some years ago by the research laboratory, which is even now engaged in an attempt further to improve this varnish, especially in its application to higher voltages and higher temperatures. At the present time the use of black varnishes has almost entirely replaced the use of yellow varnishes, the latter now being used almost solely for protection against oil.

The new varnishes are obtained by permanently combining mixtures of pure drying oils with either natural or artificial asphaltic compounds. The black varnishes have important advantages over the yellow varnishes in respect to flexibility, dielectric losses, resistance to heat and to moisture, and general insulating qualities.

The aging and plastic qualities are the ones which particularly distinguish the black varnishes from those of other types. These qualities result from the fact that each of the varnishes contains a great many constituents having slightly different boiling points. It therefore follows that, when one of these black varnishes shall have been heated to any given temperature, the low-boiling-point constituents will be slowly evaporated, while others will be in a soft state and still others will remain reasonably firm; the result being that, no matter at what temperature within reasonable limits the varnish shall have been aged, some elements will not have been heated to their flow point and the varnish will have preserved its flexibility of insulation throughout the process. The ordinary difficulties with a varnish base are that, on the one hand, if its flow point is such as to produce a firm compound at room temperatures, it will lose by evaporation a considerable number of its constituents at an increased temperature and will consequently become brittle, and that, on the other hand, if its flow point is such as to produce a firm compound at high temperatures, it will not become dry at room temperatures. It has been found, however, that some black varnishes will become thoroughly dry at room temperatures in approximately four hours and at 100 deg. cent. in approximately two hours, although further baking at the latter temperature will not destroy their desirable properties. Tests have shown that such varnishes on field coils, when baked at 200 deg. cent. for forty-eight hours, remain intact and still possess very good adhesive properties.

In conclusion it may be stated that, as a result of experiments, the black or bitumen varnish has become the standard for insulating compounds except when the insula-

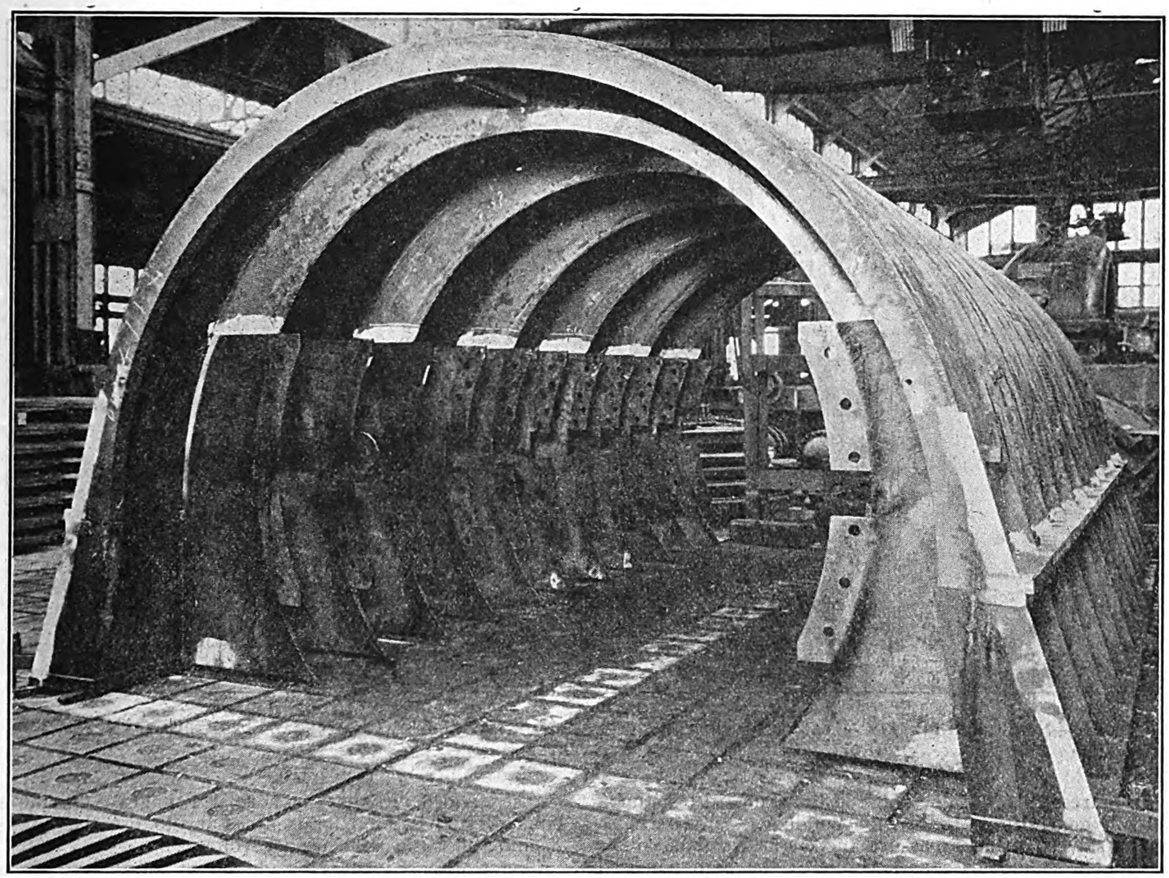

FIG. 20—STRUCTURAL-STEEL OUTER STATOR FRAME OF 100,000-KV-A. GENERAL ELECTRIC TURBO-GENERATOR FOR SOUTHERN CALIFORNIA EDISON COMPANY.

tion is to be immersed in oil, as in transformers. All the insulation used in the armature of generators, whether mica or varnished cambric, is now applied with black insulating varnishes, whose dielectric properties have lasting qualities far superior to those of the yellow varnishes. In fact, for this class of work, yellow varnishes are used only in the turn insulation of some of the field coils, which require adhesive qualities rather than dielectric properties. Shellac itself is used only in binding, where the cementing qualities are required for forming the strands of the bar or coil.

Higher Voltages

Within a relatively short time, enormous strides have been made in the development of generators and steam turbines. Rated capacities of single machines have increased to such an extent that the currents to be handled would greatly exceed the capacities of standard disconnecting switches and circuit breakers if the generators should be operated at voltages as low as 14,000. It has been found that generator voltages can be increased a certain amount with much less difficulty than would be encountered in developing circuit breakers of proportionately greater current-carrying capacity.

In 1918, two 12,500-kv-a., 22,000-volt, three-phase, 50-cycle, 500-r.p.m. synchronous condensers were sold to the Andhra Valley Power & Supply Company, Ltd., of Bombay, India. These condensers have been operated for eight years in an atmosphere of great humidity and high temperature without armature insulation failure.

In 1926, the Southern California Edison Company purchased two 100,000-kv-a., 16,500-volt, steam-driven turbo-generators, which are probably the first large generators purchased in America for operation at voltages decidedly higher than 14,000. The first of these two units has been constructed and is undergoing factory test at the time of this writing.

Several machines have been purchased for operation at 22,000 volts. A cross-compound unit rated at 235,000 kv-a. is now being built for the State Line Generating Company. A 61,765-kv-a. generator for the Super-Power Company of Illinois has already been shipped, after having been completely assembled and tested at the factory. All the high-potential tests, including the A. I. E. E. test of 45,000 volts, were made on the latter unit with no more appear-

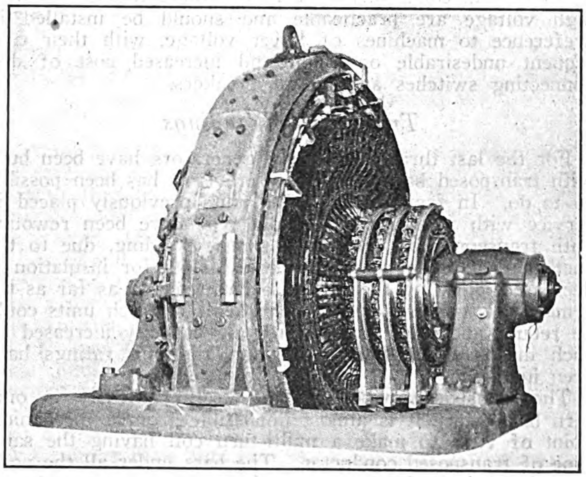

FIG. 21—4000-KW. GENERAL ELECTRIC SYNCHRONOUS CONVERTER WITH ROLLED-PLATE FRAME.

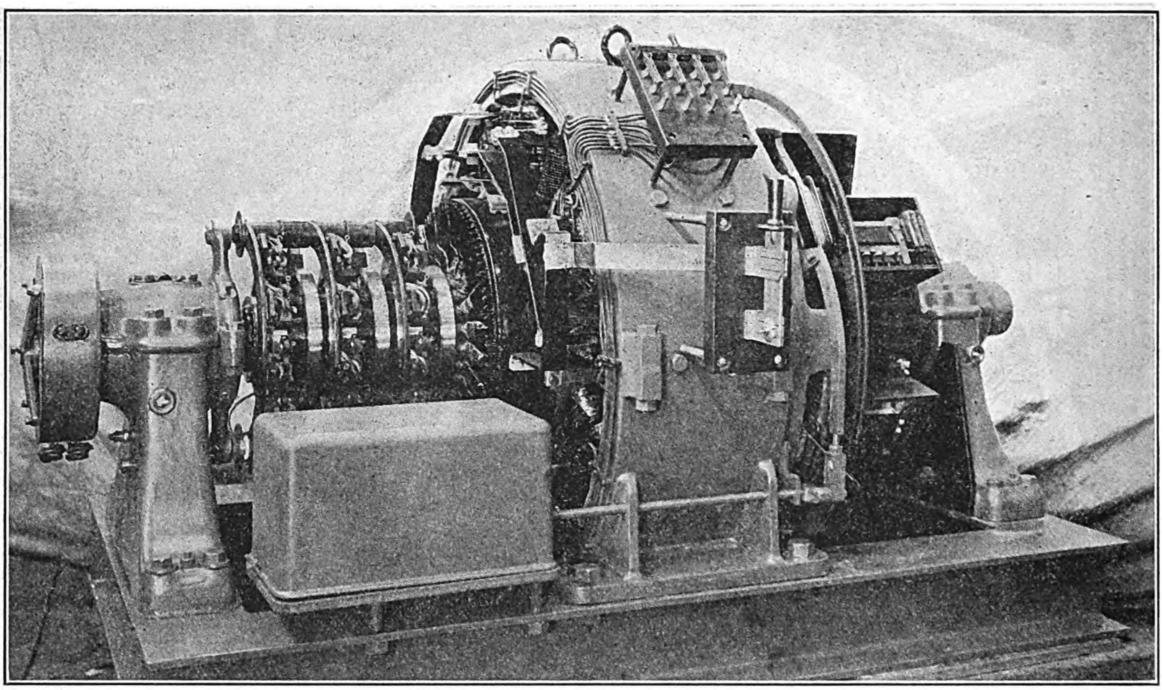

FIG. 22—Structural-Steel Base and Rolled-Steel Frame of 500-Kw. General Electric Synchronous Converter.

ance of distress than is to be noted in the standard tests upon 14,000-volt generators. Before the building of any of these units, tests were made to assure the engineers that no serious trouble should arise as a result of the high potential at which the stator windings would operate. Extra insulation was necessarily required, and certain changes were made in its application; however, no changes were made in the insulation itself. The extra insulation, unless the current density is reduced, increases the temperature difference between the copper and the cooling medium with respect to the difference existing in generators of lower voltage.

It is to be expected that generators, especially the smaller units, are more expensive when wound for 22,000 volts than for 14,000. More insulation is necessary, greater coil cross-section is required, a larger core is desirable, and the generator must be somewhat more liberally designed in respect to overall dimensions and weights than the generator of the same capacity wound for a lower voltage. However, under certain conditions large units wound for operation at high voltage are practicable and should be installed in preference to machines of lower voltage, with their consequent undesirable operation and increased cost of disconnecting switches and circuit breakers.

Transposed Windings

For the last three years turbo-generators have been built with transposed bar windings wherever it has been possible so to do. In fact, many of the units previously placed in service with windings of the old type have been rewound with transposed bar windings, such rewinding, due to the fact that the space taken up in the slots for insulation is decreased, allowing the rating to be increased as far as the armature is concerned; when the fields on such units could be rebuilt and their current-carrying capacity increased by such means as grooving the rotor, the unit ratings have been increased.

The transposed winding lends itself primarily to one-turn bars, since it is almost impossible from a mechanical point of view to make a multi-turn coil having the same type of transposed conductor. The bars under all the poles are placed in series on units of average size in order to secure the customary normal voltage. However, on larger units, voltage conditions are such that it becomes necessary to use divided circuits for normal voltages. On the small units of high voltage, it is necessary to use the multi-turn winding to secure the proper voltage.

The transposed bar is made up of a number of copper strips, these strips varying in width from 0.15 in. to 0.4 in., and in depth from 0.08 in. to 0.12 in. The width of the bar is always equal to the width of two of these strips, and the depth of the bar is determined by the current-carrying capacity necessary, the conductor on the larger units being from 15 to 24 strips in depth. Each individual strip of copper is insulated with asbestos, which is not only fire-proof but has sufficient insulation to prevent short circuits between strips, the multi-strip conductors being carefully tested to insure freedom from short circuits.

The method of transposition of the strips in the conductor is such that equal voltage is induced in each strip by the flux which leaks across the slots. Hence, there is no resultant voltage to cause circulating current in the conductor, and the transposed bar, therefore, has extremely low load losses.

As the bar is molded, it is wrapped with layers of mica tape, and is given a vacuum and compound treatment intended to dry the insulation and fill all the voids with compound. The bar is then wrapped with additional layers of mica tape, applied with a black varnish, until it is thought that sufficient layers have been applied safely to withstand the voltage of the generator. The bar is then given another compounding, followed by the application of a so-called stay binder. The final treatment consists of a wrapping with asbestos tape for the full length of the core, this tape serving as a combined mechanical protection and corona shield.

The use of bar windings permits the removal for repair or replacement of the top conductor without disturbing the remainder of the winding, whereas in the case of the coil winding it is necessary to disturb a considerable number of coil sides whether the defective coil side is in the top or the bottom.

It should be noted that the transposed bar is seldom used on salient-pole machines, since most units of this type require a multi-turn coil of more than two turns per coil, and since the inverted turn, whose load losses are almost as small as those of the transposed bar, presents considerably less difficulty in manufacture.

Divided Circuits

One of the outstanding developments of the year in the line of power generation is the double-winding generator. This machine has two completely independent windings, arranged in alternate slots and so connected under the poles that the terminal voltage of the corresponding phase of each winding is in phase with and numerically equal to that of the other winding.

Like the generator of higher voltage, the machine with divided circuits is the result of a demand to keep generator currents down to their present order of magnitude regardless of increases in unit capacities, in order that the disconnecting switches and circuit breakers so far developed will remain of adequate capacity. Although it was at first planned merely to divide the generator winding into two circuits, the idea was conceived, after a study of the design of the unit and its application to the central station, of using it in a bus arrangement similar to that diagrammatically shown in Fig. 23. It has been found possible under such conditions entirely to eliminate the necessity of installing bus reactors, since there is normally no electrical connection between bus sections and any transfer of kilovolt-amperage from one bus section to another must be made through the two generator circuits. It can readily be seen that the series reactance of these two circuits is interposed between bus sections, with a resultant greatly reduced value of short circuit on either bus. It can also be seen that, since the two generator windings are in the same structure and are therefore energized from the same magnetic field, they cannot fall out of step, and the reactance thereby introduced between bus sections in no way reduces system stability.

FIG. 23—ONE-LINE DIAGRAM OF BUS SYSTEM WITH DOUBLE-WINDING GENERATORS.

In the past, two types of double winding have been considered, of which the first consists of two complete and independent windings in the same stator, each having two coil sides in every slot. Windings of this type are very expensive and are used mostly for multi-speed motors; it can readily be seen that the increased cost of installing four coil sides instead of two in every slot, and of making the corresponding end connections, is a considerable item, and that the cost of insulation is, to all intents and purposes, doubled by doubling the number of coils. These windings cannot be satisfactorily used in the double-winding generator, regardless of cost, since the two circuits would have slightly different values of reactance.

The second type of double winding consists merely of two circuits obtained by placing the coils under one-half the poles either in series or in multiple in each circuit. Such a winding, when arranged with coils under alternate poles in series so that the effects of uneven magnetic densities caused by rotor eccentricity, lamination joints and the like are as far as possible obviated, has been found very desirable for use with what is known either as split-conductor or interwinding differential protection. Unfortunately, however, two-circuit windings of the second type are impracticable for use in the double-winding generator: the placing in series of coils under alternate poles renders the series reactance between circuits of a high value, and adds greatly to the length and complexity of the pole connectors; the grouping together of coils under adjacent poles, or a separation of the coils under each pole of a two-pole unit, renders imminent the setting up of a prohibitive mechanical vibration as a result of the severe magnetic unbalance occasioned by the slightest inequality in loading.

What may be termed the third type of double winding, viz., the one originally mentioned herein and diagrammatically shown in Fig. 24, has permitted the introduction to the central-station industry of the double-winding generator. It can readily be seen from the illustration referred to that, whereas one winding always leads the other by one slot pitch under any given pole, two voltages are obtained which, as previously stated, are always in synchronism. It should be noted that, since each winding is uniformly distributed around the complete periphery, only perfectly balanced magnetic forces are produced. Another advantage in this method of winding is that no additional insulation or space is required, except for the additional number and special arrangement of the end connections and leads.

In calculating the characteristics of the double-winding generator, it is convenient to make use of the equivalent-circuit theory so familiar to all central-station engineers. Reference to the equivalent circuit obtained will suffice to show that power can be transmitted through the double-winding generator for the bus layout shown in Fig. 23.

Whereas it is of course necessary, in 13,200-volt generating stations whose units are rated at less than 135,000 kv-a. each, only to use one oil circuit breaker for each generator and, therefore, the use of the double-winding generator can eliminate only one breaker and one reactor for each bus section of a single ring bus; it is necessary, on the other hand, to use two breakers for each larger generator, and it is possible to eliminate two breakers and one reactor. However, in addition to the saving in number of breakers, there is a considerable saving in the interrupting capacity of the breakers required. As a matter of fact, such a generating station as is shown in Fig. 23 has only approximately one-half the interrupting duty imposed on its breakers for a bus fault as would be imposed by the same number of single-winding units with 10-per-cent reactors between the sections of a single ring bus. There is, of course, more of a hardship inflicted on the windings of the generator or generators nearest the fault, but the windings have sufficient thermal capacity to remain in operation under the circumstances for one minute with only approximately 30-deg.-cent. additional temperature rise in the copper.

Fraction Slot Winding per Circuit per Pole per Phase

FIG. 24—SCHEMATIC DIAGRAM OF THE GENERAL ELECTRIC DOUBLE-WINDING GENERATOR.

The double-winding generator is applied to its best advantage on systems where the loads on the bus sections can be reasonably balanced, thereby keeping the two circuits of each unit loaded equally. Although it is possible to carry load on either winding without carrying any on the other, the transferring of power through a unit under such circumstances results in a reactive voltage drop of from 25 to 30 per cent in the 60-cycle case, and of approximately 15 per cent in the 25-cycle case. It should be noted that if it should be desired to carry more than half of the generator capacity on either winding, it would be necessary to increase the copper cross-section, and, in effect, build a generator of larger capacity.

From calculations made on various systems and from actual tests made in the factory, there is believed to be a very strong tendency on the part of the rotors of synchronized double-winding generators to remain in synchronism with each other under fault conditions. In fact, when a three-phase short circuit was made on one bus section of a ring bus provided with no reactors and connected to two model double-winding generators, each of which was carrying load, the strength between the windings connected to the non-short-circuited section proved to be sufficient to hold the units in step for approximately one second; the oscillographs show that first one unit and then the other tried to speed up, but could not do so on account of the strength of the tie. In similar tests, where more than two machines were used in a ring bus, the units never pulled out of step with each other on three-phase faults and the voltages on the non-short-circuited bus sections held up to approximately twice the corresponding voltages of a system being fed by the same number of single-winding units and having 10-per-cent reactors between the sections of a single ring bus.
